All this sounds excellently scientific, and yet at each sentence one is fain to stop the theorist with the cry "*Distinguo*." First, we are not well informed as to what happened before the Aryan invasion of Europe. But, for argument's sake, we will grant that all the account of the small dark Euskarian foes of the Aryans is true. But what follows? Are fairies all small, dark, and hostile? And here we must distinguish among fairies. In Scott's excellent essay on the subject, prefixed to the ballad of "Tamlane" in the *Border Minstrelsy*, he begins by examining the fable of the Northern dwarfs who dwell in the hollows of the hills, and are greatly skilled in metallurgy. The dwarfs forged the famous sword Tyrfing, which was never drawn without slaying a man, and which dealt the three dolorous strokes. Now the writer in the *St. James's Gazette* has to make a singular leap to connect the Euskarians, skilled only in polishing flints, with fairy beings of more than mortal craft in metallurgy. Scott himself puts forward an historical explanation. He thinks the dwarf smiths may have been a distorted memory of the Finns, a race well skilled in mining and in the working of minerals. But we imagine that the Finns, like the Lapps, have themselves the tradition of a happy, blameless, and skilful subterranean people. Whether these were Euskarians or not, it is certainly bold to connect a Neolithic people with a fabled race whose specialty is skill in forging weapons of bronze or steel. The Euskarian theory is more fortunate in the matter of the flint arrowheads. These are indeed called fairy arrows; but Scott observes that bronze celts are called fairy axes. Now the Euskarians *ex hypothesi* had no bronze; so it seems probable that the country people use "fairy" as x is used in algebra—to stand for any unknown quantity in knowledge. But the Euskarian theory grows still more dubious and risky when we look at the etymology of the words *fada* (Provençal), *fade* (*patois* of Berry), *fée*, and so on. Why should the Celtic inhabitants of Gaul use the Roman word *fata*, answering to the Greek Μοῖραι, or Fates, as a name for their own dark, skilful, subterranean elves? Here the argument divides into two currents; first, what were the Fata, and Μοῖραι; secondly, are the Fades and Fées, who correspond to our fairies, derived philologically from Fata?

Here we come to a very curious point. The Fata, or Μοῖραι, had one attribute in common with our fairies. They came to the birth of children, and gave them the gifts of destiny; they span, too, like the fairies in nursery tales. They span the web of good and evil fortune. The Μοῖραι have these duties in Homer; but long ere Homer's time the same functions were performed by the Hathors of Egyptian folk-lore. Here, then, we have female shapes in three old mythologies, which answer to our spinning fairies of the fateful birthday gifts; but they have nothing in common with the metal-forging, neolithic, spiteful, subterranean, Euskarian fairies. Then why, as we asked before, should the Celtic Gauls have borrowed the word *fata* to designate their gnomes? Again, are the words *fade, fada, fée* derived from *fata* at all? Are the fays not direct descendants, spiritual and philological, of the old Roman *Fatuæ?* The French *fées*, like a section of the Scotch fairies, are beautiful women of the woods and waters, not squat and dark-haired, like the Euskarians, but fair, and with yellow locks, like the New Zealand sea fairies, or with green tresses, like the Russian Rusalkas; beautiful always, like the Servian Vila. "The hill was her mother, the dew her mother's milk, the wild wind rocked her cradle." The love of these fays is sometimes baneful to men, as in the Breton legend of the Sieur Nan. Strangely enough, the New Caledonians, who know not Euskarians, have the same fairy-lore. A credible witness assured us that a Kaneka prophesied that his own death would follow, as it did, a few days after he had been the lover of one of the fairy women of the island. Now these women being the creatures who, in European fable, have the first right to the name of *Fades* and fays, it is plain that they have no apparent connexion with short, black, hostile Euskarians. Have they any more connexion with the word *fata?* We confess that the derivative from *fatuus* seems to us much more plausible. In Facciolati's Lexicon, *fatua* is rendered "eadem quæ bona dea." *Bona dea* has much analogy to "the good folk," "the good neighbours" of Scottish fairy lore. Lactantius has much to say about the prophetic *fatuæ*, but Mr. Coote's essay on "The Neo Latin Fay," in the second volume of the *Folk Lore Record*, contains information enough for most inquirers. We seem then to have reached these results:—*fata* need only have a remote and unessential connexion with the fays; there is no connexion at all between *fata* and metallurgic gnomes, Euskarian or Finnish; lastly, the genuine fays and fairies answer to what we know of the *fatuæ*.

It does not need much fairy lore to see how commonly the fays are women, in all respects unlike the short dark women of a hostile race. Our fairies answer to the Nereids of modern Greek superstition—airy shapes that dance on the hills, and allure young maidens to join their company. Again, our fairies are curiously connected with the ancient classical myths of Hades. They have a kingdom underground, like Hades; they are ruled by a queen, like the subjects of the dread Lady Persephone. The middle ages half consciously recognized this; thus Chaucer speaks of "Pluto that is king of fayrie," and of "Proserpine and all her faery." In the old romance of Orfeo (Orpheus) the classical hero seeks his lost Eurydice, not in Hades, but in fairyland. Fairies and beings of the fairy order are essentially a popular superstition. Nothing prevents us from supposing that, before there was a Greek literature, the Greek peasants had their stories of the under-world of Faery, which stories poets later combined with other materials into the full-grown myths of Hades. However this may be, the Scotch Kirk, when Jane Weir was tried for witchcraft, recognized that "the Fairy Queen" was but another name for the lord of the under-world, the Devil.

The result of this hasty inquiry is to prove, we think, or at least to suggest, that fairy mythology is a tissue of many threads of fancy. Fragments of history, half forgotten, may be woven into tales of skilled dwarfs, dwellers in mysterious mines. A superstition less readily accounted for supplies imagination with nymphs and Nereids, *fatuæ* and *fées*, lovers of mortal men as were Mélusine, Calypso, and the Queen of Faery who led the Rhymer into her own country, riding through rivers of slain men's blood. Yet another, but kindred, superstition supplies the Fata and Μοῖραι, the fairy godmothers, with the mystic birthday gifts, and the woven web of fortune. Once more we have the most graceful creations of man's fancy, the soulless ladies of the sea and the river, the mountains and the wells. Over the whole mass of tangled imaginations, the genius of Shakspeare, of Fletcher, of Herrick, of Homer, and Virgil has brooded, and produced Titania and Oberon, the Pixies, Calypso, and all the choir of Thetis and Cymodoce. Apart, again, from these are the wilder shapes of the woodland, *lamiæ* who steal children, and the dreadful women of the night who wash the bodies of the dead by the moonlit shores of the rivers of France. These beings start from imaginative beginnings as rude and remote as the ancestral Zulu spirits which people African thickets, and are at last formed by popular and poetic fancy into the characters of the *Midsummer Night's Dream*.

BESANÇON.

BESANÇON lies at present, but will not lie much longer, out of the ordinary path of the English tourist. When the new railway is completed across the department of the Doubs, from Besançon to Le Locle in Switzerland, the natural and most direct route from Paris to Neufchâtel will pass through the town. But although this circumstance is likely to give a final movement to the prosperity of Besançon, it is not needed to make the town the most flourishing on the eastern frontier of France. Commercial and political changes have combined within the last fifteen years to bring about this state of things. Since the cession of Alsace, Besançon has taken very much the position of Mulhouse as an outpost, and amasses the trade of the frontier under the immediate protection of Belfort. And, while these external advantages enlarge the wealth of the town, it possesses an internal industry which increases every year in importance. The foundation of the famous watch-making trade of Besançon is historically curious. The agitations of the Revolution, headed by Bassal and Bernard de Saintes, practically destroyed the prosperity of Besançon as it had existed under the *ancien régime*, but the same agitations, and indeed the same agitator, founded on the ruins of the old a much more important new industry; for it was Bassal himself who, in 1793, introduced into the town a colony of watchmakers from La Chaux-de-Fonds and Le Locle, exiled for their sympathy with the French Republic. Slowly the newcomers settled down and persuaded the townsfolk to adopt their trade; but it has only been since 1860 that the watchmakers of Besançon have been able to compete successfully with Switzerland. In 1861 the municipality granted the Town Granary, a handsome building dating from the earlier part of last century, to form an Ecole d'Horlogerie, and the French market in watches is now almost entirely supplied by Besançon. The old and somewhat sombre city has the character which the general adoption of a single employment somehow gives to a town—a peculiar air of uniformity and precision, which is rather difficult to define, but very easy to feel, and which is certainly appropriate in a place entirely given over to watch-making.

From the earliest times there must have been some camp or village on the site of Besançon. It is one of those points to which men crowd instinctively, led by the extraordinary geographical advantages of the position. Leaving the frontier of Switzerland, the Doubs, a broad, and at some places even majestic, river, flows south-west through the parallel folds of the northern outskirts of the Jura. In reaching Besançon, it is confronted by a rock that towers with precipitous sides above its waters. To avoid this obstacle, it turns suddenly to the north, but is pressed back again directly by the line of hills on the other bank, and, returning to the foot of the rock, pursues its south-westerly course. But, in taking this *détour*, it has formed a small horseshoe, a peninsula the narrow isthmus of which is entirely filled up by the precipitous rock, now the citadel. Such a position was not likely to be long disregarded, even by savages. Cæsar, in the *Commentaries*, is eloquent over the advantages of Vesontio, which had long been the capital of the nation of Sequania. It was not, however, till the reign of Nero that Rome became practically aware of the strength of the site. Vesontio clearly proclaimed herself in favour of Galba, closed her gates against Verginius Rufus, and gained the lively recognition of the new Emperor. Marcus Aurelius, perceiving the growing opulence of the town, made it a Roman colony, under the title of Colonia Victrix Sequanorum, and under his protection Vesontio began to make that display of architectural splendour the ruins of which still adorn her squares and her museums. Christianity was soon after this introduced into the town by two missionaries from Lyons—St. Férreol and St. Ferjeux—who were cruelly executed by the Roman prefect in the theatre of Vesontio, on June 16, 212, and who thereupon became and have remained the patron saints of the city. Of the early history which may be said to have closed with this sensational incident, many curious relics remain in the modern Besançon. The ruins of this very theatre, preserved in the public gardens, oddly but appropriately styled Square Archéologique, consist of certain elegant columns and fragments of columns, the drums of which are singularly small for those of an antique building. These were discovered lying where they now stand, and in all probability mark with exactitude the façade of the theatre where St. Férreol and St. Ferjeux were tormented and beheaded.

The Middle Ages have left but little mark of their passage upon Besançon. The Christian architecture of the town is mean, and offers no striking peculiarity. The Cathedral is a tasteless basilica of the eighteenth century, heavily decorated with marble and gilding, and taking the place of an ancient Gothic church destroyed by Vauban in 1674 to make room for his fortifications. It contains a superb picture, a Fra Bartolommeo, of which the pedigree is above suspicion. This fine work, a Madonna supported by St. Sebastian and St. Stephen, was a commission given to the great master by Ferry Carondelet, and an entry exists in the town records to the effect that the city received it from Italy in the spring of 1518. As Fra Bartolommeo died in 1516, this is probably one of the latest of his works, one even which he did not live to forward to its destination. Little, however, of interest as is presented by the Cathedral, the other churches of the town are even more insignificant examples of poor eighteenth-century work, or, still worse, of nineteenth-century eccentricity; while, from the heights to the north, a visible eyesore from all quarters of the compass, shines the hideous church of St. Claude, an experiment in modern Gothic which tends to make the English visitor resigned to much that he has left behind him at home. The military monuments of Besançon are far more interesting than the ecclesiastical. No position could be conceived more delightful to the fancy of an artist in fortification, and the greatest of all such artists had an opportunity of displaying his skill here to the utmost. In 1674, when Louis XIV. had stormed the town after a siege of twenty-seven days, it was determined that Besançon should be transformed into a fortress of the first order. Vauban, then at the height of his reputation, was invited to undertake the works; and he planned them with special enthusiasm, although they were not fully carried out until 1711. The marvellous feeling for nature which this unrivalled architect possessed is nowhere more plainly shown than at Besançon. His lines of fortification start from the facets of the cliff, and stand out against the sky with the appearance of veritable rock, so exactly has Vauban adapted and exaggerated the natural curves of the mountain. Since 1870 it has been difficult, almost impossible, to penetrate into the citadel; and the visitor is thus prevented from obtaining what must certainly be the finest view of the town, which must lie like a map at the feet of the rock girdled by the broad waters of the Doubs.

Even though this privilege be denied, it is very easy, by the exercise of a little pains, to obtain such views of Besançon as serve to prove it one of the most romantic cities in France. For the purposes of modern warfare the citadel is by no means sufficient protection to the town, and very strong forts have been constructed on the still higher hills north and south, Fort Chandane and Fort Brigilli. To the outskirts of these fortifications the visitor may climb without indiscretion, and look down, not on the town merely, but even on the citadel itself. The character of the valley is almost Scotch. Under a cloudy sky it would be easy to persuade oneself that a broad glen of Perthshire lay at one's feet, though the Tay would but poorly typify the grandeur of the Doubs. The rivers of France rarely do justice to their own volume and magnitude. The tributaries of the Seine, for instance, wind without dignity under their endless avenues of poplar-trees through a uniformly flat and inexpressive country. The Doubs is considered the finest French river, and it owes its reputation to the fact that, with undiminished volume, it flows through scenery which is almost mountainous in the grandeur of its forms. Close to Besançon there are two ruined mediæval castles, Montfaucon and Montferrand, the size and beetling height of which would have been celebrated by a hundred bards had they chanced to tower above the Rhine. But the fact is that Frenchmen themselves have scarcely waked up to the beauty and romance of the scenery of Franche-Comté.

Besançon is justly proud of the large number of distinguished men to whom it has given birth. Victor Hugo was born—as he himself says, by accident—in a little house that now looks on to the capitals and arches of the Square Archéologique. His parents were hastening northward from the Court of Madrid, when the poet just contrived to secure his Gallic birthright by being born in these very unassuming lodgings. He has many times promised to visit his natal city in state, but hitherto one accident or another has always prevented him. Two other active regenerators of an effete civilization first saw the light at Besançon; for here Fourier was born in 1772, and Proudhon in 1809. The milder and much more charming genius of Charles Nodier was awakened here in 1780, and the reader of his delightful reminiscences will retrace with pleasure and amusement many of his early ramblings. Various other celebrities are duly chronicled in the excellent guide which has just been published (*Besançon et ses environs*. Par Auguste Castan. Besançon: Marion. 1880) by the chief of the Town Library, a guide which leaves nothing to be desired either in fulness of detail or elegance of form. The name of M. Castan reminds us that the Public Library is one of the chief attractions of the town. In 1694 an abbé of Besançon left in his will to the town a very valuable collection of books, pictures, antiquities, and coins which he had principally obtained from the family of the great Cardinal de Granville, the Viceroy of Naples, and Minister of Spain. After the lapse of a century there remained enough of the matchless collections of this famous connoisseur to make the gift of the abbé extremely valuable. The library was opened to the public on the 7th of July, 1696, has constantly been enriched, and now consists of 130,000 volumes. Among the gems of the collection are a dozen books from the library of King Mathias Corvinus, the fate of whose literary treasures is one of the most famous romances of bibliography. The visitor is shown, with natural pride, the architectural studies of Pierre Adrien Paris, the architect of Louis XVI., and director of the French Academy in Rome. Paris was a younger contemporary of Piranesi, and these designs remind the student of those of the greater artist. The collection attracted much admiration during the lifetime of the architect, and he was offered 30,000 francs for its possession. The Bisontins, however, as the inhabitants of Besançon call themselves, have great pride in their native town, and the patriotic M. Paris declined this gilded bait to present his beloved collection to the Public Library of the city. This act of *vertueuse abnégation* is duly commemorated by a grateful municipality, and has done more to make Pierre Adrien Paris known to posterity than all his careful drawings. It is much to be wished that in England we had a little more of that desire to beautify and enrich our provincial towns which makes many of the departmental capitals of France so interesting.

THE HEIGHT OF DIVERSION.

We suppose that the statement that London and Paris are the chief centres of civilization is as little of a contentious statement as any that could be framed on the subject. M. Victor Hugo would no doubt be indignant at the elevation of London; severe persons of English or German nationality may think that too great a compliment is paid to Paris. But, on the admirable principle by which the merit of Themistocles was ascertained, the assertion may be almost certain of proving itself. The intelligent Japanese might stickle for Tokio, and the intelligent Borderer for Peebles, but still London and Paris are pretty sure to be placed in everybody's list. Therefore it is interesting to those who take a fond pleasure in contemplating the progress of the species to investigate the ways and manners of these two capitals, and especially their amusements. On Sunday and Monday last an excellent opportunity for this investigation presented itself. On Sunday Paris had a glorious time—which expression is not a Yankee vulgarism, as the vulgar think, but occurs in the writings of no less a person than John Dryden. A Montgolfier balloon was advertised to ascend from some place of public amusement, with Miss Lena Lisa or one of her sisters suspended from a trapeze attached thereto. Hasty readers are requested not to think that they can at once perceive the exquisite pastime promised by this advertisement. To hang from a trapeze underneath a balloon of ordinary construction is a sufficiently perilous proceeding, and when the suspended person is of the weaker sex the delicacy of the sensation is obviously much increased. But with the original or Montgolfier form of balloon, where the lifting power is simply the effect produced on ordinary air by fire underneath an open bag, the danger is of course much increased, because these balloons are liable to many more accidents than the more perfect closed apparatus filled with coal gas and regulated at pleasure by valves. But at the last moment it seems that Miss Lisa Lena, or Mlle. Albertine, either had a prior engagement, or for some other reason failed to put in an appearance. So a young athlete named Navarre volunteered to go up for the sum of two pounds sterling—an advance upon the tariff of twopence mentioned in a proverbial expression not otherwise inapplicable to the case. Further, M. Navarre, having the honour of his profession at heart like all good Frenchmen, refused to be tied on. The result hardly needs to be told. At a great height the wretched man's head or his muscles failed him, and he fell, burying himself deep in the earth, according to some accounts, while others describe the circumstances of his death with additions of even more fantastic horror. The balloon, not to be outdone, proceeded to burst (which Montgolfier balloons have rather a habit of doing) and fell on the spectators, "greatly frightening them." But they must have felt that the rare good fortune they had just experienced was cheaply purchased at the price of being bonneted by the strips and fragments of a burst balloon.

While this was going on at Paris preparations were being made in London for a spectacle not very dissimilar in kind, but varied in circumstances. It is not as yet considered proper in Sabbatarian England to amuse oneself with the spectacle of the mercenary death or torture of human beings on Sunday. We wait till Monday. On Monday last, at the usual place, the Agricultural Hall, began one of the now common exhibitions patronized by a few people who ought to know better, attended by thousands who evidently do not know better, and miscalled trials of endurance. The eminent Rowell, champion long-distance pedestrian of the world (or some part of the world, for the distinctions of athletic championships are subtle), had been challenged by the aspiring Pegram; and several other distinguished and doubtless consistent walkers had joined the contest, for the usual six days' struggle, "go as you please." As soon as the idle conventional restraints of the first day of the week were over, the men were started "with a few words of caution," which also are usual on these occasions, and which irresistibly remind the reader of a certain historic prayer about the shedding of blood. The beginnings of these contests are comparatively tame; indeed they might be mistaken for the sort of race in which uncivilised persons, vacant of the glorious gains of the latter days, still take a considerable interest. The men are fresh, in good training, and sound in wind and limb. It is gratifying, however, to know that on the present occasion the patrons of the sport had an unusually short time to wait for their favourite and expected pleasures. The record of these pleasures is not wholly agreeable to read, for the new long-distance contest differs from the old P.R. not in being any the less brutal, but in being entirely destitute of the rich *argot* which adorned the annals of the older institution. At one o'clock on Monday afternoon "the proceedings were enlivened" by the arrival of a band, but still more by the fact that Pegram, a man of colour, "seemed far from well," and had frequently to leave the track. This is what the amateur of long-distance contests can, as De Quincey would have said, recommend to a friend. To see an apparently hale and vigorous person career round a ring is monotonous; but to see a wearied and beaten wretch flinch as he puts down his bleeding feet on the ground, or stagger round the track with the half-drunken gait of one on whom the desire to sleep has come in an overpowering burst—this is truly delightful. Indeed one of the historians of the present contest has hinted that from the beginning there were peculiarly interesting features about it. Most of the competitors were very young men, and "it remains to be seen whether such very young men will be able to forego sleep with the same facility as their older opponents." There were other promising symptoms. It seems that Mr. Dobler, one of the American champions, is of so game a disposition that, according to his trainer, "if he had only one leg left he would go on." The idea of such a sight may well make the connoisseur in long-distance competitions lick his lips, though perhaps his anticipation is short-sighted. For clearly the man who has two feet in a disabled condition must feel twice as much pain himself, and therefore give twice as much pleasure to the spectators, when he puts them to the ground, as the man who has but one. Donato—does any one now remember Donato?—after the first novelty wore off, would not be a satisfactory competitor at a walking-match. However, we are omitting our history. Suffice it to say that the celebrated Blower Brown and Pegram, the coloured challenger, broke down on the very first day. This is not quite as it should be; for the object is not that a man should break down completely the first day, but that he should hobble on for four or five. Still the break-downs, when one remembers what that phrase means in the present instance, were in themselves doubtless an agreeable excitement. Besides, Littlewood, another competitor, "kept on steadily, though he suffers considerably from his feet, which are rather raw." This is the real thing for the spectators at the Agricultural Hall. For ourselves we are quite content with it, and shall not investigate the particulars of the contest any further.

It is scarcely necessary to say that the utter condemnation which we pass upon these disgraceful and idiotic exhibitions has no sort of connexion with any dislike of athletics or of pedestrianism in particular. The man who has never enjoyed the pleasure of resting at night after his own legs have carried him thirty, forty, or fifty miles from the place where he rested the night before, has missed, it may be, one of the lesser, but certainly not one of the least, pleasures of life. But it has been over and over again pointed out that these brutal proceedings have absolutely nothing to do with honest, downright walking under natural conditions. Their attraction, denied or disguised as it may be, is simply the attraction which certain vulgar natures feel in the sight of the suffering of others. We do not hesitate to pronounce them more and not less degrading than prize-fighting, which had at least a very definite reference to the practical affairs of life, and the disuse of which, though it has no doubt stopped a great source of blackguardism and rascality, has perhaps exercised in some respects an unfavourable influence on the behaviour and disposition of Englishmen. It was useful to know how to use your fists on occasion, and the use of them was not the worst way of settling quarrels. It is not useful, and cannot be useful under any conceivable circumstances, to be able to trot or stumble so many hundred miles in a given time on a prepared path, with elaborately prepared stimulants, restoratives, and appliances of all kind ready at hand. All this is as obvious and as trite as the performances themselves are discreditable, but while the facts are repeated it is necessary to repeat the comment. There is not a pin to choose between the spectators who crowded to see Navarre go to a death which, if not absolutely certain, was at any rate highly probable, and the spectators who crowded to see Littlewood going very slowly, because he suffers considerably from his feet, which are raw. We do not advocate legislative interference in these matters (except in the sense of sharp enforcement of the law of manslaughter in cases of what are facetiously called accidents), because such interference would be nearly impossible, and, if possible, not particularly wholesome. We do not suppose that any remonstrances would have the least effect upon 'Arry and his like; but we really do think that 'Arry's betters might find some worthier employment than the provision of these disgusting spectacles for their inferiors. Without such provision it is exceedingly doubtful whether they could go on. Fortunately the expenses of keeping a huge building open night and day for a week are very considerable, and now that London in the small hours is rather a dreary place, even the most devoted amateurs hardly care to sit up all night. The gate-money is therefore a decidedly variable quantity, and has, we believe, on some occasions barely sufficed to cover expenses. Another point against the pastime is that its choicest moments cannot be anticipated, and must be long waited for. The accessories or assistants, whichever word be preferred, at M. Navarre's suicide, had their pleasure hot and strong, and all in a burst. Unless an ingenious system of telegrams, giving such news as "Smith's left foot quite raw, hurry up to Islington," or, "Robinson has strained a sinew, he is moaning as he walks," could be arranged and posted all over London from time to time, these exquisite delights must necessarily be lost or wearily expected. Hence a good deal of encouragement *ab extra* is needed to keep the amusement in vogue. Unluckily that encouragement seems to have been hitherto forthcoming without any difficulty. It would be really interesting to get a well-skilled casuist—say Mr. Capes or the Prime Minister—to estimate the relative moral position of the persons who give this encouragement, and of the sportive bargee who was found guilty at Bristol the other day of promoting a contest of endurance by turning on the water into a lock in which two boys were trying to rescue a third from drowning. For it must be remembered that these long-distance contests have actually resulted in loss of life, both in this country and, we believe, in America, and that it is more or less an accident that they do not do so oftener. The bargee in question might justly have argued that if the two boys had had more endurance, and had held on tighter, the third would not have been drowned. Indeed, lock proprietors might perhaps, in these unprofitable days for canals, turn their attention to a new source of revenue.

MALTA.

MOST complaints are more or less reasonable if they are looked at from the complainant's point of view, and the address which certain inhabitants of Malta have lately presented to Lord Kimberley is no exception to this rule. The address is itself an amplification of a petition previously presented to the House of Commons, in which Parliament is asked to amend the Maltese Constitution in two important particulars. The people of the island, if this petition fairly represents their wishes, want to be governed by a civilian, not by a soldier, and to be secured against the alteration of laws affecting local interests, the imposition or alteration of taxes, and the expenditure of public revenue, "otherwise than by the vote of the majority of the people's representatives in Council assembled." The petitioners then descend to particulars, and ask that a certain vote for draining the fortified towns of Malta, which was passed by "the majority of the official members against the unanimous opposition of the elected members," may be revoked. The address to Lord Kimberley contends that the social and economical questions which have lately come before the Maltese Government are not suited to the application of military methods. They can only be wisely settled by a Governor who has had the training of a statesman. What can a soldier know about Sanitary and Building Acts, about the provision of dwellings for the labouring classes, about water supply and drainage works? Even if he takes them in hand without any bias one way or the other, he is at least as likely to go wrong as to go right, and he is far less likely than a civilian to be free from bias. It cannot be denied that this representation is in itself perfectly reasonable. No dependency likes being governed by a soldier, and, with rare exceptions, no dependency is so well governed by a soldier as it is by a civilian.

Much the same thing may be said with regard to the second request. The address pleads that, when the British Government granted the inhabitants of Malta a representative element in the Government Council, it could not have been intended that this representative element should be entirely subordinate to the official element. The object of representation is that the people represented should be able to get their own way; and if their representatives are liable to be outvoted by members who represent no one but the Government which appoints them, they might just as well not have seats in the Council. If there is any question on which the people of Malta may fairly claim to be consulted, it is the drainage of their towns; but even on this point the *ex officio* members of the Council have been too strong for them. The Government had one theory of how a town ought to be drained, the elected members of Council had another; and the Government insisted that its own plan should be adopted in preference to any other. It is not unfair, perhaps, to assume that Malta is not more anxious than other communities to spend money on sanitary improvements, and it is probably quite as alive as other communities to the imprudence of putting forward this distaste in its naked simplicity. No one nowadays is old-fashioned enough to say, "I dislike paying for the drainage of the town I live in." A surer and more efficacious way of escaping the burden is to object successively to all the schemes proposed, on the ground that the perfect plan has not yet been discovered, and that it is foolish to waste money on mere stopgaps. When, therefore, the authors of the address maintain that what they desire is a "consistent, practicable, and efficient system of drainage," and that what they object to is the system of drainage which the Government, after giving full consideration to the subject, have decided to be the best, we know pretty well what this passion for the ideal is worth. At the same time, it must be admitted that the people of Malta have a *primâ facie* case against the Government. Why, supposing them to be unanimously opposed to modern conceptions of drainage, should they have these conceptions forced upon them? We do not pass sanitary reforms in England by the vote of the Treasury Bench. Why should we adopt in the case of a dependency a plan which we should not tolerate in our own persons?

The answer is clear and conclusive, though unfortunately it is scarcely one which the people of Malta can be expected to appreciate. Malta does not stand in the position of an ordinary dependency. It has to be governed, not merely for its own good, or in accordance with its own views, but for the good and in accordance with the views of the empire of which it forms a part. Generally speaking, Great Britain can afford to consult the views of her dependencies; indeed in not a few instances she has been able to give them more self-government than they can use to their own advantage. But Malta does not enjoy this happy insignificance. The island is so important from a military point of view that it has to be regarded from that point of view only. It is unfortunate that the Maltese, who, according to the petitioners, originally "placed themselves under the protection of the British Government" because they thought it better suited than any other to satisfy their "legitimate wants and aspirations," should find that their right of administering their own affairs is still but imperfectly recognized. But this is a disadvantage which they share with the inhabitants of Gibraltar and Portsmouth, and any other fragments of British territory which have a military importance altogether out of proportion to their civil importance. It is conceivable that Gibraltar might prefer not to be troubled with a garrison, or that Portsmouth may think the condition of an unfortified town happier than that of a town which is surrounded by ramparts and earthworks. The reply to all such complaints is that a house-door might as well plead to have its surface undisfigured by locks and bolts. If there were no such things as burglars this innocent preference might be consulted; and when peace has become universal and perpetual, the people of Malta may be allowed to administer their own affairs in their own way. Until this millennial period dawns upon Europe, successive Colonial Secretaries will be compelled to say, with Lord Kimberley, that "the peculiar position of Malta as a great Imperial fortress and naval station will always render it necessary that the ultimate decision, whether local or Imperial views are to prevail, should rest with her Majesty's Government," and that for the same reason, it is expedient, in the future as in the past, to place "the supreme control of the administration in the same hands as the military command." When Malta is of no more value to the Empire than any other island of the same size, its inhabitants may be left to determine whether their towns shall be drained or undrained. The Imperial Government will then have no interest in making them more healthy than they desire to be. But, while we maintain garrisons in Maltese towns and ships in Maltese harbours, the health of the troops and the sailors must be cared for by the Imperial Government, and it can only be cared for by compelling the people of Malta to look after their own health. We may admire the yearning after sanitary independence if we choose, but from admiring it to gratifying it is a longer step than any reasonable Minister is ever likely to take.

LAURENCE TOMSON'S NEW TESTAMENT.

IN a recent article headed "The Breeches Bible" we gave some account of the remarkable three leaves of Questions and Answers on the doctrine of Predestination which were inserted between the Old and the New Testament in the edition of the Genevan Bible which was issued in quarto in 1579, and which, we stated, were reprinted in all the quartos of this version down to the year 1615 inclusive. As the chief purpose of that article was to illustrate the truth, which is now becoming more and more clear, that the English Reformation was all along conducted entirely on Zwinglian and Calvinistic principles, and had scarcely any connexion with Lutheranism proper, and that Laud destroyed Calvinism, which had become rampant in the Church of England, we omitted all notice of a much larger number of editions of a work which is known to bibliographers as the "Genevan Tomson," which must also have been suppressed by Laud's influence, as the last edition of it appeared in 1616. It was also foreign to our purpose to notice particularly the editions of the Genevan Bible which preceded that in which this Catechism was first inserted; but perhaps it may be worth while to add here that, as Archbishop Laud suppressed this Bible, so one of his predecessors in the see of Canterbury, Matthew Parker, seems to have discountenanced it, for no edition was printed in England during his primacy. Grindal succeeded him in 1576, and the successive issues of this Bible immediately began, the first London folio being dated 1576, and there being successive editions of this size every year till his death in 1583—if, at least, what Cotton states is true, that there were folios of 1580 and 1581, which seems, however, doubtful. It seems as if Grindal had encouraged the use of this Bible in churches as against the use of Parker's, or the Bishops' Bible, which was first published in 1568, and which, though frequently reprinted during Parker's primacy, was only once published in this size during the time that Grindal occupied the see of Canterbury, whilst after Grindal's death no folio Genevans were printed for nine years.

We now propose in this and a following article to supplement what we have said by giving some account of the Tomson editions of the Genevan Bible with a New Testament, revised and annotated; and we do so the rather because, in an historical point of view, this book has been almost entirely overlooked, and even bibliographers have omitted to notice some very curious points as regards the different editions of it. Before proceeding further we may correct an error in our previous article concerning the neglect to notice the Questions on the part of historians and bibliographers. It has been pointed out to us that Cotton mentions them in his "List of Editions of the Bible in English," and we have since seen that even Lewis, in his "Complete History of the Translations of the Bible," says that they appear in the Genevan folio of 1583. In this he is quite correct, and it is the only folio in which they are printed. There are a few octavo editions, and notably one of 1591, printed at Cambridge, in none of which they appear. Lest any one should be misled by an error of the press in our previous article, it may be as well to say that the date of the first edition of the Genevan Bible is 1560, not 1568 as there printed, and that when we spoke of the Bishops' Bible as having been re-issued in 1588, and perhaps later, it would have been more accurate to say that there are four editions of a later date, the last being of 1606, and that a New Testament of this version was published as late as 1619.

As we shall have occasion to mention the distinguishing marks of Tomson's editions further on, we must first say a few words more on the pure Genevans. As there are at least thirty-five editions of this version in 4to. independently of those in other sizes, we cannot profess to speak with certainty, but we believe there is no material variation in them. Speaking under correction, then, we may say that they are in black letter, with the headings of the chapters in italics, and also a few words in Roman

type at the left and right hand side at the top of every page, calling attention to what appeared most noteworthy in the page, according to the profession made in the address to the reader which, in the original edition of April 10, 1560, is addressed "To our beloved in the Lord the brethren of England, Scotland, Ireland, &c. Grace, mercie, and peace through Jesus Christ." In the course of that address its authors say that, to help the reader, "we have set over the head of every page some notable word or sentence which may greatly further aswel for memorie as for the chief point of the page." It is scarcely possible to avoid noticing here how the Puritanical views come out at every corner of the book. Amongst these headings of the pages will be found in every one of these Bibles, at the chapter which records the death of St. John Baptist, the title, "The inconvenience of dauncing," as if the dancing of the daughter of Herodias before Herod had been the principal point of the whole narrative. Probably it was thought that, as the parallel passage in St. Matthew had been headed "John Baptist beheaded," it might be well to call attention to another aspect of the story which should vindicate the strict *régime* under which Geneva was placed by Calvin's severe discipline. The rest of the headings are fair enough, and show no particular *animus*, unless the frequent notice of idols and images may be thought somewhat of an exception, and the special calling attention to doctrine in the two headings in the Acts, "Ordained to salvation" and "Predestination."

The marginal notes, of which we gave a specimen in our previous article, and which are not very numerous, are also in Roman type, as likewise are the arguments prefixed to the several books, there being what is called "an argument" prefixed to the Apocrypha expressing pretty much the same view that appears in the 6th of the Thirty-nine Articles as adopted for the first time in 1562, the Forty-two Articles of Edward's reign being silent on this subject. The translators' disparagement of the Apocrypha is further indicated by the almost entire absence of annotations, there being one notable exception—namely, on 2 Macc. xii. 40-45—where, by way of protesting against prayers for the dead, the note asserts that

From this verse to the end of the chapter the Greek text is corrupt, so that no good sense, much less certain doctrine, can be gathered thereby. Also it is evident that this place was not written by the Holy Ghost, both because it dissenteth from the rest of the Holy Scriptures, and also the author of this book, acknowledging his own infirmity, desireth pardon if he have not attained to that he should. . . And though Judas had so done, yet this particular example is not sufficient to establish a doctrine no more than Zipporah's was to prove that women might minister the Sacraments.

It was certainly unfortunate that the translators should have invented such a monstrous fiction to defend their opinions. Any scholar who will turn to the Greek will see that it is perfectly good and intelligible, and free from any corruption of the text. But, to continue our account of these editions as distinguished from the Tomsons. First, we observe that in all of them the Apocrypha appears sometimes with the paging or foliation going straight through from the beginning—*e.g.* the editions of 1594 and 1606; sometimes, as in the edition of 1579, where the Questions first appear, beginning with a new foliation and a new signature at the foot of the page, and followed by the New Testament with a title and three other leaves, containing the "Summe of the whole Scripture" and the "Certaine questions and answeres," there being printed on the back of the fourth leaf the names of all the books, including the Apocryphal, the New Testament beginning with a new foliation. We have seen a copy with these four leaves wanting; but that they were torn out, probably by some one who disliked Calvinism, is evident from a reference to the foliation, which omits folio 435-440. The later editions have in some instances a kind of concordance and index added, compiled by one Robert F. Herrey in 1578, and which may occasionally be found bound up with copies. In other respects some of the editions seem to resemble each other very closely, so that a leaf from one might be substituted for the corresponding leaf in another without the change being easily detected. This is the case especially in one of the four editions issued in 1594 and that of 1606.

And now we proceed with our account of the Tomsons. And first as regards the editor. Laurence Tomson is little known except from the account given of him in his Latin epitaph in Chertsey Church, where he was buried. He is there said to have been Professor of Hebrew at Geneva, and to have been on intimate terms with Walsingham, whose secretary he was till Walsingham's death in 1590. Amongst other things that he published were a translation of some of Calvin's sermons and a version of the New Testament with Annotations, which Antony Wood speaks of as being printed in 8vo. in 1589, and several times republished. Dr. Bliss has very properly added in his edition of Wood the dates 1576 and 1577, but quotes in his note to the passage some curious mistakes made by Kennet and Baker, apparently without knowing that they are mistakes. This is not much to be wondered at perhaps, for even Cotton, writing a few years later, seems to be in profound ignorance of the editions of this book. And it does not appear as if any writer had taken much trouble in collating the text of this edition with that of the Genevan version, or again in comparing the different issues of this work one with another. Cotton has given a few verses of two different passages in parallel columns to show how little variation there is between the Old Genevan version and the revised one in this edition—and it happens that in these instances there is only one variation in each passage—but, if he had carried his researches further, he would have found certain places where the changes are much more numerous. Thus in the Third Chapter of St. John's First Epistle there will be found at least ten variations. Dr. Westcott has called attention to the frequent alteration of *the* into *this* or *that*, and rightly attributes this to the influence of Beza's version, which frequently, though not uniformly, renders the Greek article ὁ by the Latin pronoun *ille*. The effect is, as he observes, almost grotesque, but he has somewhat overstated the case when he says that Tomson has been consistent in this. He does not always even follow Beza, who is himself far from doing this consistently. A good specimen of what is meant may be found in the first verse of St. John's Gospel, which is rendered in the Vulgate "In principio erat Verbum et Verbum erat apud Deum et Deus erat Verbum," but by Beza, "In principio erat Sermo ille et Sermo ille erat apud Deum eratque ille Sermo Deus," and by Tomson, "In the beginning was that Word, and that Word was with God, and that Word was God."

But we are somewhat anticipating matters. The first edition of this book appeared in 1576, and its original title was "The New Testament of our Lord Jesus Christ, translated Out Of Greeke by Theod. Beza: Whereunto are adjoined brief Summaries of doctrine upon the Evangelistes and Actes of the Apostles, together with the methode of the Epistles of the Apostles, by the said Theod. Beza: *And also short expositions on the phrases and hard places taken out of the large annotations of the foresaid Authour and Joach. Camerarius by P. Loseler Villerius.* Englished by L. Tomson. Imprinted at London by Christopher Barkar, dwelling in Paules Churchyeard, at the signe of the Tigre's head, 1576. *Cum privilegio.*" It is dedicated to Walsingham and Hastings, and contains a translation of Beza's Latin dedication to "Lewys of Bourbon, Prince of Condé," &c. The notes, which are partly in Roman, partly in italic type, are much more numerous than those in the Genevan New Testament, and are entirely different from them. Those which are in Roman character are for the most part translated from Beza's marginal annotations, though they have been in some few instances designedly altered from Beza's—those in italics being for the most part the author's own or selected by him. This distinction in type has, we believe, been preserved in every edition of this New Testament, which was issued separately. The notes are very numerous, and towards the end of the volume occupy more than half the page, and are printed in type which is so small as to be somewhat difficult to read. This edition was reprinted in 1577, with no other difference than the addition of a table at the end, which was continued in all subsequent editions. The book speedily became very popular, and was reprinted in various sizes of 8vo. till 1616, after which it no longer appears. There are also two issues of it in 4to. of 1583 and 1596 in black letter, all the rest being in Roman character. The editions of 1602, 1610, and 1616 have a variation which we shall notice when we come to speak of the same alteration being introduced into the Genevan Bible with this Testament annexed. But there are several editions of the text without the notes, in a very diminutive form, which have for the most part escaped the notice of bibliographers, but which we have seen in Mr. Francis Fry's magnificent collection of Bibles. These are chiefly imperfect; and, as they want both title and colophon, it is impossible to assign the year of their publication. A reference to almost any chapter is sufficient to identify them as Tomsons and not Genevans. Five of those without notes are without date, and average in size about three inches by two. But there are also three issues of this version without notes, of about the same size, dated 1578, 1592, and 1593.

One other characteristic of these Testaments is their omitting the arguments which were prefixed to the different books in the Genevan Bibles, there being only one—namely, that to the Epistle to the Hebrews, which is abridged from that in the Genevan, omitting the apology for not calling it St. Paul's Epistle on the ground that it "is not like" to be his. Here Dr. Eadie, in his work entitled the *English Bible*, has made the ridiculous mistake of accusing the writer of saying "that if it be Paul's, it is not like," quite altering the meaning, which was that, on external grounds, the Epistle is not likely to be St. Paul's, no opinion whatever being given as to internal evidence, or the likeness or unlikeness to the style of St. Paul.

It will have been seen that the description of this version on its title-page is very misleading. For, though considerably influenced by Beza's version, it was in no sense translated from Beza, any more than was the Genevan, which it closely follows, though this also was much influenced by Beza's version. Another peculiarity is the Prefix to the Revelation, which has very few marginal notes, but has the following apology for their omission, also translated from Beza:—

I have not thought good to put forth any such thing as yet upon the Revelation as I have upon the former bookes, notwithstanding I liked wel to set down in the mean season that that I wrote a few years since concerning the authoritie of this booke. And this is it.

And here follow six pages answering objections against, and giving reasons in favour of, its authenticity. Of the general character of the notes we shall have something to say in a future article, which will be devoted to the editions of the Genevan Old Testament with the Tomson version of the New Testament annexed to it, which run over the period from 1576 to 1616, after which they were no longer printed in England, though there are some editions of later date printed at Amsterdam.

THE AËRONAUTICAL SOCIETY.

THIS excellent Society has certainly no undue desire for publicity, and is in no hurry to tell the world of its proceedings. Its fourteenth annual Report, which has just appeared, is principally filled with an account of the papers read and the discussion that took place at the general meeting which was held on June 23, 1879—that is, sixteen months ago. The information thus tardily afforded has, however, lost none of its value through the lapse of time, and merits attention as relating to a peculiar and interesting branch of inquiry. In one respect it leaves unfortunately a painful impression. Scepticism penetrates everywhere in these doubting days, and it seems to have found its way into the bosoms of those confident and greatly believing men, the modern professors of the art of flying. Such, at least, is the inference to be drawn from the speech of Mr. Glaisher, who officiated as chairman at the meeting just mentioned. This gentleman is, as we need hardly say, one to whom all lovers of the air must look up with profound respect. In a heroic effort to go up higher in a balloon than any one had ever gone before, he very nearly succeeded in putting an end to his life. Greater proof of devotion no man could give, and it must be not a little depressing to those who hold that gravitation is much overrated, and yearn for wings, to find that such an enthusiast takes a mournful view of the future of flying. Mournful Mr. Glaisher's view certainly is; for at the beginning of his remarks he sadly observed, "We have always hoped that at our next meeting we should have something startling to speak about," very clearly implying that the Will-o'-the-Wisp was as far off as ever; and at the conclusion he said:—"Mr. Brearey [the Honorary Secretary of the Society] speaks more sanguinely than I can; but if a man is not sanguine he will never get on in this world, and I hope, in the paper he has prepared, he will have some information to give us in support of his views." Obviously Mr. Glaisher does not think that there is much chance of mankind being fitted with wings for some little time to come; and if such distrust is shown by the gentleman who is elected to preside over the Aëronautical Society, it is to be feared that the outside public, always sceptical about flying, will become more incredulous than ever. Happily, however, there is Mr. Brearey to rebuke unbelief, and there are other members of the Society who are far indeed from despairing, and take a very different view from that of their worthy but despondent chairman.

This was made evident in the discussion and papers which followed his melancholy preamble. The first speaker was Mr. Moy, who holds perhaps the highest rank amongst those who are striving to enable man to fly through the air. On this occasion, after informing his hearers that an experimental apparatus had been constructed which was very efficient, Mr. Moy proceeded to deliver a learned, but not over-intelligible discourse, in the course of which he gave some explanation of the action of the screw propeller. It is not a little remarkable that the action of the screw propeller is perpetually being explained afresh by learned theorists, and yet that those who fit propellers to vessels are constantly obliged to rely on simple experiment. However, Mr. Moy's hearers were doubtless much impressed by his knowledge of this subject, and by a disquisition on "aëroplanes" with which he favoured them; and it is painful to think that enthusiastic expectation must have been somewhat disappointed when the result of all this science was announced. Bringing to bear his acquaintance with shifting centres of pressure and other difficult matters, Mr. Moy constructed a small model fitted with what seems at first sight the unnecessary appendage of wheels. This, after running awhile on a smooth surface, was to rise. It was tried, and rise it did; but Mr. Moy was obliged to admit that it only "just lifted off the pavement." This certainly seems a terribly small result for so much scientific investigation; but after finishing his paper Mr. Moy seemed able for a moment to animate the drooping hopes of his audience as he announced that his model made stronger had "flown"—how far or how high he did not say. Possibly the majority of the Society were well content to accept Mr. Moy's statement without petty details; but the Chairman, whose scepticism was apparently increased rather than diminished by the reasoning he had listened to, asked some questions which appeared to indicate a doubt on his part as to whether the machine had ever risen. In this we think he unnecessarily outraged the feelings of the aëronauts round him. There is no reason for supposing that small models might not be made to rise in the air, as the problem at which Mr. Moy has been working was solved some time ago. Many of our readers may have seen an ingenious little toy which about three years since was for sale in many London shops. It somewhat resembled a gigantic dragon-fly, and, on being wound up and let loose, rose in the air and sustained itself for some time. In Mr. Moy's model, which is made on the same principle, the motive power is obtained from "indiarubber springs winding 500 turns." No doubt he can make a toy which will rise higher and remain in the air much longer than the other; but hopeful indeed must those enthusiasts be who think that out of twisted indiarubber they will get persistent strength enough to carry them about over the heads of their fellow-men. Even amongst the members of the Aëronautical Society there were some who were apparently struck by the fact that, when the models did rise in a becoming manner, there would still be a slight difficulty to be got over; for in the discussion which followed the reading of Mr. Moy's and other papers one member said, "Are you trying to get mechanical flight by screwing round indiarubber or simply by generating steam?" and another said roughly, but forcibly, "What are you driving at? I understand about making models, and I say there must be a distinction drawn between the tension of indiarubber and the obtaining of power by mechanical means through the aid of steam." These questions have a pertinent look, but they do not seem greatly to have disturbed the meeting, and there appears to have been a general impression either that indiarubber would do, or else that, if a thing could be done on a very small scale with twisted indiarubber, it could be done on a large scale with steam, which we take to be one of the most perfect and beautiful assumptions ever made.

After the conclusion of Mr. Moy's paper a short paper was read by Mr. Phillips, the well-known inventor of the Fire Annihilator. Some members of the Aëronautical Society are apparently under the impression that the Fire Annihilator is to aid in attaining flight. On what this peculiar view rests we must confess ourselves unable to state; but happily it is unnecessary to consider the question, as, in a characteristic manner, the Chairman disposed of the subject. After considerately informing Mr. Phillips that an experiment which he saw at the Exhibition of 1851 showed that the Fire Annihilator had great power, but that, when it was shown at Covent Garden Theatre, where it was to put a fire out, it nearly set the building on fire, he said, "But although it possesses great power I do not see how that power, moving in this fashion, reaches the problem we have to solve." A doubt may be felt as to the necessity for his amiable allusion to the Covent Garden incident; but the justice of his general conclusion may, we think, be fairly assumed to be indisputable. To some extent in keeping with the tone of his straightforward remark was the paper read by Mr. Brearey, the hopeful Honorary Secretary who was spoken of at the beginning of the proceedings. This gentleman, in addition to the merit of being sanguine, has that of being candid, for he was as downright with regard to his friend and fellow-labourer Mr. Moy, as the Chairman was with regard to Mr. Phillips. Mr. Moy's model, he said, did not rise when tried in his presence, and he did not seem to think that there was much chance of its ever behaving better. He further mentioned that a full-sized flying-machine contrived by Mr. Linfield absolutely refused to lift its ingenious inventor from the ground. These statements must have damped the spirits, already perhaps somewhat depressed, of the Aëronautical Society; and we fear that they cannot have found much to cheer them when Mr. Brearey went on to point out the more pleasant aspects of the case. After discoursing somewhat vaguely about flight and wave-like action, he spoke of a flying machine with all the requisite qualities but one, which would be "at the command of a man with a power on which he could depend." We trust we are not guilty of rudeness if we say that here the Honorary Secretary of the Aëronautical Society slightly reminds us of Mrs. Micawber. Speaking of her visit with her husband to the Medway, that lady observed, "My opinion of the coal trade on that river is that it may require talent; but that it certainly requires capital. Talent Mr. Micawber has; capital Mr. Micawber has not." Wings Mr. Brearey has; motive power he has not—that is all that is wanted at present. When this trifling hitch is got over man will be numbered among the flying creatures, but for the moment things are at a standstill. It is only fair to Mr. Brearey to say that in one respect he surpassed Mr. Moy, as he produced a model which would fly. He feared a full experiment on account of the danger to the pictures on the walls of the room—the obvious precaution of controlling his flying-machine by a cord not apparently occurring to him—but he finally sent off a model which he had brought there to show some ladies, and it flew "nearly across the room." This no doubt was satisfactory, but, as we have already observed, a toy was some time ago invented which would sustain itself in the air, and we do not gather that Mr. Brearey has done more than improve on this toy. Pleased as the ladies may have been to see the model fly, we cannot but imagine that there must have been a certain amount of disappointment amongst the members at nothing more being achieved. Probably not a few of them may have hoped, to use the Chairman's words, for "something startling," and may have had the fond expectation of seeing Mr. Brearey—duly tied by the leg, to prevent his injuring the pictures—rivalling the alleged feat of the famous Mr. Home and floating gently over the heads of his admirers.

No such delightful exhibition was afforded them, and it does not seem likely that the results which are so ardently desired will be achieved for some little time to come; but, with the exception of the Chairman, the leading spirits of the Aëronautical Society seem hopeful; and most sincerely do we trust that their long-continued hopefulness is well founded. Greatly is it to be desired that they may be successful in their arduous quest. Things look rather gloomy at present, it is true; but perhaps that little difficulty about the motive power will be got over, and the conflicting claims of aëroplanes and wings be settled. Possibly even in our time a winged Secretary will silence scoffers for ever, and prove the power of man to fly by rising in sight of an assembled multitude from the Crystal Palace, Primrose Hill, the Westminster Aquarium, or some such other appropriate place.

GROWTH OF WEALTH IN FRANCE.

WE have had of late years such striking proofs of the wealth of France that we are apt to disregard fresh evidence afforded from time to time of her ability to bear with comparative impunity a strain which would produce formidable consequences in most other countries. Yet, whether we look at the matter from a political or an economic point of view, it is very important that we should measure aright the strength and weakness of a nation so intimately connected with ourselves. It is little more than nine years since the close of the disastrous war which inflicted such terrible suffering upon France, and of the Communist insurrection which augmented so enormously her losses, and laid her capital in ashes. Then she had to redeem the territory left to her by the payment of an indemnity intended to crush her; and, as the result of all this, she had to make an addition to her taxation which would have oppressed the energies of any other Continental State. A few years of fleeting prosperity followed, and it almost seemed as if the very traces of her disasters had disappeared. But new visitations awaited her. The bad seasons which have tried all the rest of Western Europe have resulted in France likewise in a series of deficient harvests—the last, as with ourselves, having been probably the worst of the century. France, as is well known, is a country of peasant proprietors, who, it might be thought, would be ill able to bear a series of bad harvests; but, severe a trial as that was, it was not the only one they had to go through. One of the ideas of the First Napoleon in his war to the knife against this country was to encourage the cultivation of beetroot in France, so as to make her independent of West Indian sugar. The idea has borne such good fruit that our own sugar-refiners complain of being ruined by the French; and beetroot has become one of the principal crops of many important French districts. Last year this great crop also suffered from the incessant rain and cold. The silk crop, again, was a total failure. And—a still more serious matter—so was that of wine. The importance of the wine industry in France must be known to all our readers. Vineyards cover a larger area than wheat does in the United Kingdom, and in one shape or another the produce is estimated to give employment to seven millions of people. This vast industry has for years been smitten by an apparently incurable disease, which, in spite of all efforts to stop it, has constantly been extending its ravages, and has destroyed the vines of whole departments. Last year the injury done by disease was aggravated by an almost total failure of the grapes to ripen even in the vineyards that had escaped the *phylloxera*. And where there was seeming ripeness, the juice was found to be too sour to make wine fit for the market. Under this accumulation of misfortunes almost any agricultural population, however large might be the resources in capital and skill of the individuals composing it, might be expected to suffer distress. How much more, then, six millions of peasant proprietors? But, as a matter of fact, we have heard comparatively little of distress in France. Not only has there been nothing of the suffering witnessed in Ireland, but there has not even been any extensive inability to meet engagements, such as in England has compelled landlords to grant reductions of rent.

Is it really true, then, that there have been the failures of which we have spoken? Or are they gross exaggerations circulated for some dishonest purpose? The best way to answer this question is to examine how the foreign trade of France has been affected. Statistics of the crops might be open to doubt for one reason or another, but the returns of the Custom-house are beyond suspicion of bad faith or inaccuracy. Besides, mere statistics of crops tell little to a foreign public without much explanation. It is obvious, however, to the simplest understanding that a great and sudden increase of the imports of food must be due either to partial failure of the home supply or to a foreign competition which the home producer cannot withstand. And either interpretation means heavy loss to the peasant proprietor. On consulting the French foreign trade statistics, we find that from 1873, when the disturbance caused by the war and the Commune may be supposed to have passed away, to 1875 inclusive, the exports exceeded the imports by from 8 to 13½ millions sterling annually. In 1876, however, there was a reversal of the balance of trade, the imports in that year exceeding the exports by 16½ millions sterling. The excess of imports over exports has continued ever since. In 1878 it amounted to 43,646,680*l.*; last year it rose to 54,845,200*l.*; and in the first nine months of the current year it actually reached 51,177,520*l.* We do not belong to the economical school which views with apprehension an increase of imports. On the contrary, we fully recognize that such increase is proof of augmented purchasing power. We do not cite these figures, therefore, as evidence that France is in a desperate case. Our purpose rather is to show what has been the effect of the series of bad harvests upon her foreign trade, and how immense must be her accumulated wealth, and how widely diffused must competence be among her people, since she has met all the demands upon her without visible effort. There has not been a bread riot in any town, there has been no agitation on the part of any class for a reduction of their burdens, nor any difficulty in collecting the taxes. On the contrary, each year ends with a handsome surplus, and each session of the Chambers witnesses a remission of taxation. But we have not yet shown in what way the excess of exports over imports in the period 1873-5 has been changed into such an enormous excess of imports over exports in the years that have followed. We find, then, that in the first nine months of 1876 the food imports, including cereals, wines, and animal food, amounted to 26,842,000*l.*; in the corresponding period of 1877 to 29,112,000*l.*; in that of 1878 to 39,629,000*l.*; in 1879 to 52,452,000*l.*; and in 1880 to 60,039,000*l.* It will be seen how continuous has been the increase, and how much more rapid it has been in the two latest years. It was in 1876 that the balance of trade turned, and here we have the explanation. The harvest of 1874 was a splendid one, and the total imports of corn and flour in the following year were under four millions sterling. But since then there has not been a really good harvest, and the imports have in consequence gone on growing. Even if we take 1876, which followed a moderate harvest, as the basis of our comparisons, we see that in the first nine months alone of the following years there has been an aggregate increase in the purchases of food abroad of 83,844,000*l.* In other words, bad agricultural seasons since New Year's Day 1877 have cost France about half the amount of the indemnity to Germany. Of this vast amount corn stands for by far the largest sum. Wine does not appear as a heavy item till the current year. In the nine months ending with September last the wine imports amounted to 8,837,640*l.*, against 3,060,840*l.* in the corresponding period of last year; and only 1,661,440*l.*, in the first nine months of 1878.

There is little to be added by way of comment to the force of these figures. They are sufficiently eloquent in themselves. They prove, for one thing, that, whatever may be the cause of the stationariness of population in France, it is not poverty. The people have the means of maintaining large families, if they had the inclination. Further, they prove that social order in France rests on firmer foundations now than it ever did before. Material progress, the accumulation of wealth, the development of industry, the distribution of comfort have gone so far that the population is impatient of disorder, which depreciates property and impairs the value of thrift. In former times such seasons as have visited France of late, inflicting such heavy losses on the majority of the population, would have resulted in popular tumult and revolution. Now they have not caused so much as a ruffle on the surface of society. Even the irritations of the "Ministère de Combat" did not provoke disturbance. There is one other lesson taught by the figures, which is that, when France next engages in war, she will be found a formidable adversary even by the most powerful coalition. The greatness of her prosperity, and the command she now has of her own destinies, will prevent her from rushing into hostilities with a light heart; but, if she is once worked up to the fighting point, her vast army will be supported by wealth and credit equalled only in England and the United States. Even though she has lost Alsace and Lorraine, she now bears her enormous taxation as lightly as she bore the much smaller taxation of 1869. And, if driven to it, she could afford to spend a couple of hundred millions annually over and above her present expenditure for years together without being exhausted. We may be reminded that the large imports of which we have been speaking have caused a serious drain of gold, which has reduced the cash held by the Bank of France to less than 23 millions sterling. But what of that? The Bank of France thought so little of the drain that for months together it took no serious measures to stop it. When at last it did act, it only raised its rate of discount to 3½ per cent., and yet, apparently, it has stopped the drain. That cannot have been a very serious malady which required only such gentle treatment. Far too much has been made of this drain. It may be admitted that the French monetary system is faulty, that the Directors of the Bank of France have acted with political pusillanimity, and that the drain will probably recur at an early date. But this does not affect our argument. Rich nations, like rich individuals, can afford to commit follies; and if France chooses to nurse speculation at the expense of her gold reserve, she knows very well that she can get back the gold whenever she is willing to pay the price for it.

THE THEATRES.

PLAYGOERS who were fortunate enough to witness the admirable performance by the Dutch company of players who visited London this year of Mr. Rosier Faassen's prize national drama *Anne-Mie* must have looked forward with interest, not unmixed perhaps with doubt, to its presentation in English at the Prince of Wales's Theatre. The venture seemed to be more bold than wise; for it was obvious enough that much of the charm of the Dutch performance could not but be lost in the process of transplantation. Apart from the intrinsic attractions of the Dutch acting, the entire novelty of the manners and customs depicted, which were known to be true to the phase of life with which the play dealt, had in itself an element of success. For those who saw the piece in the original, this attraction has of course entirely vanished, and it may be doubted whether very much of it remains for playgoers to whom the piece is practically new. The sense that the thing is at best but a careful imitation can hardly be entirely got rid of, and might interfere to an appreciable extent with the success of a better constructed piece than *Anne-Mie*. It may be imagined that Mr. Rosier Faassen's object in writing the play was to introduce as many incidents and customs as possible characteristic of Zeeland life at the date which he chose, and to devise a plot in the course of which the introduction of these

should seem unforced and natural. If this was his aim, it may be said that he succeeded in a marked degree, and that, as the play was given by the Dutch company, the gloomy tone which runs through the plot was enough, or nearly enough, relieved by the brightness of some of the incidental business. There was a freshness and a *verve* about the scene of village life in the second act which was singularly attractive; and in their careful imitation of the business of this scene the English actors are not unnaturally somewhat cramped. The song seems, in spite of Mr. Forbes-Robertson's pleasant singing, to have lost its impulse, as the dance has lost its *abandon;* and the whole scene wants the spontaneity and brightness which "the phlegmatic Dutch" infused into it. It may be noted also that both in the latter part of this scene and in the other portions of the play Miss Beersman's power as an actress enabled her completely to avoid the depressing monotony into which Miss Ward falls. Miss Ward's performance is indeed a curiously disappointing one. To express the most pathetic and most varying emotions, she employs the same look, the same gestures, the same mechanical smile and hard, artificially caressing tone of voice which suited so well the entirely opposite character of Stéphanie in *Forget-Me-Not.* One situation after another with which Miss Beersman produced a striking effect fails in Miss Ward's hands to have any effect, save that of weary disappointment. For failure in the first act Miss Ward is perhaps less to be blamed than in subsequent parts of the piece. The task of an actress who has in one scene to represent a young girl, and in following ones the same young girl arrived at middle age, is exceptionally difficult. But even in this act, after all allowances have been made, Miss Ward's pathos seemed as artificial as her gaiety, and as the piece goes on this fault becomes more and more accentuated. The exit in the second act, at which Anne-Mie attempts to hide her emotion from her daughter under a light manner, was in Miss Beersman's hands a very telling and moving point; in Miss Ward's acting at the same point one sees a painful attempt on the part of a practised actress to produce an effect which is entirely out of her reach. The same may be said of the recognition by Anne-Mie of her old lover in the third act; and, on the whole, it must be regretted that an actress who appeared with so much success as Stéphanie should have followed up that success by attempting a part to which she is so eminently unsuited.

The story of *Anne-Mie* is in its main features simple enough. The first act passes in West Kapelle, at the farm of Dirksen, whose daughter, Anne-Mie, is the belle of the village. For her he desires a rich marriage; but she has been seduced by an English engineer, Herbert Russell, the Rynhoff of the original play. He is anxious to marry her; but the father, on learning what has happened, is carried away by passion, and rushing out, knife in hand, stabs the Englishman. The curtain falls on the discovery of his crime. Mr. Fernandez, who plays Dirksen, gave in this scene a good picture of the ambitious, avaricious farmer, whose violent temper overpowers him. It was not his fault, but that of the stage-management, that he missed the fine effect produced by Mr. Rosier Faassen at the first handling of his knife as a general threat to any one who might annoy Anne-Mie. Mr. Bruce plays the engineer, who is unfortunately described, before he appears, as "the young Englishman with his smart clothes and his haughty manner."

In the second act Anne-Mie, with a grown-up daughter who passes as her niece, is living with her half-crazy father (who has paid for his crime by spending three years in prison) in the village of Heer-Arendskerke. The village feast, to which reference has been made, takes place, and Koenrad Deel, the most brilliant of the young peasants, proposes to Anne-Mie for her supposed niece's hand. The proposal is declined by Anne-Mie, with of course infinite pain to herself, when she finds that the one thing demanded by Koenrad's parents in his bride is stainless birth. Mr. Forbes-Robertson plays Koenrad with much grace and intelligence, but misses the rustic flavour which Mr. W. Van Zuylen gave to the part. He misses also the effect of the contrast between Koenrad's delight, when he is carried in triumph after his victory at the ring-riding by his comrades, believing that he is to marry Lise, and his exit, carried as before in triumph, after he has learnt that his suit is rejected. Mr. Flockton plays Jan Schuif, the bad character of the piece, who, however, has little enough to do with its action. He is, as always, forcible and skilful; but his make-up is curiously unhappy. He should appear as a man of much the same age as his companions. Russell also reappears in this scene, in a long Inverness cape and an unkempt beard. The third act contains the scene of the knife stuck in the table by Jan Schuif as a challenge to whoever first touches it—an incident which, though somewhat redundant, was effective enough in the original play, but which now seems a useless excrescence. It ends with the recognition by Anne-Mie of Russell, in which Miss Ward fails to produce an adequate effect. We need not describe the exact manner in which in the last act things are brought to a satisfactory conclusion; but we must give praise to the pretty love-scene between Miss Graham and Mr. Forbes-Robertson, and to Mr. Fernandez's acting as Dirksen, especially at the point where he is relieved by finding that Russell is a living man, and not the phantom who has long haunted his half-crazed dreams. We must also, before concluding our notice, commend Mr. De Lange for his excellent performance in the earlier scenes of Kwak, the innkeeper. The writer of the English version has done his work well, though the conversion of Rynhoff into an Englishman seems needless; but the production of the play cannot, as a whole, be considered fortunate.

The present performance at the Haymarket of the *Rivals* has several points in its favour. Mr. J. S. Clarke is unquestionably funny, if he is not unquestionably like Bob Acres; Mr. Conway's Captain Absolute is an excellent performance, wanting only more freedom in attitude and gesture; and Mrs. Stirling's admirable rendering of Mrs. Malaprop has improved with time. Miss Compton and Mr. Carton achieve the difficult task of making Julia and Falkland living and not uninteresting beings, and Messrs. Dawson and Lewis Ball play well as David and Fag. Mr. Kemble's Sir Lucius O'Trigger is one of the most conscientious and oddest performances ever seen. The farce of *Toodles*, which follows the comedy, has been "slightly compressed," with the result of making it hopelessly incomprehensible; but Mr. Clarke's drunken scene is certainly amusing enough.

Marked success in a new line is generally followed by imitation, and *Billee Taylor*, "a nautical comic opera in two acts," by Messrs. Stephens and Solomon, produced at the Imperial Theatre, seems to be an attempt in the school of Messrs. Gilbert and Sullivan. The play is arranged as nearly as may be on the lines of Mr. Gilbert's elaborate and consistent nonsense; but the general result is a suggestion of *crambe*, not so much *repetita*, as prepared after an ingenious receipt, but by unskilful hands. The bluntness and poverty of the dialogue serve to accentuate Mr. Gilbert's polish and invention; while the music is sometimes melodious, sometimes tiresome, sometimes like a far-off echo of Mr. Sullivan's, and never of striking merit. Miss Kathleen Corri sings prettily and steadily; Mr. Rivers and Mr. Norton are unequal to such demands as are made upon them; and Mr. J. D. Stoyle is as usual excellent, singing one song especially in the first act with marked success and humour.

By the unfortunate accident which lately befell Mr. Charles Harcourt the stage has lost an able and useful actor. It is to be hoped that the event may lead to greater precautions being adopted. The wonder is perhaps not so much that this deplorable accident should have happened, as that there should be comparatively so few stage accidents of a fatal or even a serious kind. Another loss to the stage is occasioned by the death, lately recorded, of Mr. J. K. Emmett, an American actor of a singular charm, whose undoubted talent suffered in England from the wretched vehicle employed to display his many accomplishments. Nevertheless, his keen and quiet acting in some scenes of *Cousin Fritz*, his very clever assumption of the disguise of an old German charwoman, and the gaiety and grace of his song and dance, "Schneider, how you vas?" will be long remembered by those who saw his performance.

The German stage has sustained a serious loss by the death at an early age of Herr Dettmer, who had for some years occupied the place formerly filled by Herr Devrient at the Dresden Hoftheater. In various comedies and dramas of modern life, and in many Shakspearian parts—among them of course Hamlet—Herr Dettmer's performances were of the highest value. Of the parts in which we have seen him, Faust perhaps gave the fullest exposition of his powers. His depth and earnestness of thought and purpose were throughout remarkable, set off and matched as they were by the fine and grim comedy of Herr Jaffé's Mephistopheles; while the pathos of the earlier scenes, and especially of the speech ending "die Thräne quillt, die Erde hat mich wieder," could hardly have been bettered.

NEWMARKET HOUGHTON MEETING.

THE Houghton Meeting began on one of the most lovely days of the autumn, and the course was in perfect condition for racing. An immense number of horses took part in the races of the opening day, more than seventy running in the seven races. Twenty-five two-year-olds ran in the Monday Nursery Handicap, eighteen horses ran for the Flying Stakes, and thirteen for the First Welter Handicap. Milan, who had won the Newmarket Derby at the Second October Meeting, beat a fairish field in the First Welter Handicap after a good race with Brotherhood. Hackthorpe was made the favourite for the Flying Stakes; but Rowlston beat him by a length. At the Second October Meeting Rowlston had been beaten by Tower and Sword; but now Tower and Sword was a long way behind him. The Monday Nursery was won by eight lengths by an outsider called Griselda, a grey filly by Strathconan, belonging to Lord Zetland; but she had only 6 st. 2 lbs. to carry, and she was receiving as much as 38 lbs. from one of her opponents. The race of the day was the Criterion Stakes, a two-year-old race which has been in existence for fifty years. It has not been very productive of Derby winners, only Thormanby and Lord Lyon having won both the Criterion and the Derby, but five Criterion winners have won the St. Leger. Nine horses came to the post. The first favourite was Brag, who had won a 100*l.* plate at the Second October Meeting by eight lengths. He was unpenalized; and, as he had galloped in for the above-mentioned race in such easy style, it was thought that Thebais could not give him sex and 5 lbs. This handsome filly was, however, a strong second favourite. After failing in her first two races, she had begun a career of unbroken success, winning eight races in succession, and it did not seem at all clear that she might not be the best two-year-old of her year. She had 8 st. 13 lbs. to carry. Instead of running Town Moor, who had

been second in the Middle Park Plate, Lord Rosebery ran Savoyard, who had won a race at the Second October Meeting. Sir Marmaduke, who had won the Prendergast and been fifth in the Middle Park Plate, was another starter. Altogether nine went to the post. A good start followed a short delay at the post. Savoyard had a little the best of it at first, but Bookmaker soon took the lead. At the Red Post, Bookmaker was beaten, when Savoyard again led, accompanied this time by Thebais, who wore him down as they came along the rails, beating him pretty easily at last by a length. Sir Marmaduke was only half a length behind Savoyard. Although no very extraordinary performance in itself, Thebais's victory in the Criterion, combined with her other running, makes her out to be one of the best fillies of her year, if not quite the best. She is engaged in the One Thousand Guineas, the Oaks, and the Grand Prix de Paris.

The promises of the weather on the Monday proved very deceptive, for the Tuesday turned out a miserable day. After breakfast a steady rain set in, and the rest of the day was wretched in the extreme. The authorities had very sensibly arranged that the racing should begin at twelve o'clock. In spite of the weather, the attendance was very large, even for a Cambridgeshire day. We described the race for the Cambridgeshire itself last week; but, independently of the great race, there were several very fine contests, although the horses which took part in them were perhaps scarcely first class. Old Grand Flaneur was the first favourite for the All-Aged Trial Stakes, and he made the running; but in the Dip, Tower and Sword and Flavius challenged him, and, after a remarkably grand race, he just won by a neck, Tower and Sword beating Flavius by a head. Then came a Maiden Plate, for which twenty-one two-year-olds started. Out of this large field the public were clever enough to select the winner in Goggles, who started first favourite at 5 to 1. This was even a better race than that which preceded it, there being only a head between each of the three leading horses at the winning-post, while the fourth horse was close up. The next race was won by half a length by a 10 to 1 outsider, as if in revenge for the success of the learned in the Maiden Plate. In another two-year-old race which followed, fifteen horses started, and again there was only a head between each of the three horses that first passed the winning-post, while the fourth was again close to the leaders. The Maiden Riders' Plate, which preceded the Cambridgeshire, was not a particularly interesting race; and after the great event there was so much excitement and so much betting about the objection which had been lodged against Lucetta, that no one seemed to care about the races which followed it, although the last race of the day was won after a very fine struggle by a head. Archer was on Great Carle, and Cannon was on Fiddler, and the pair ran together the whole way, Archer just succeeding in gaining the narrowest of victories at the winning post. Although a most unpleasant day as regards weather, it was a wonderful day's racing, and between ninety and a hundred horses ran in the course of it.

On Wednesday the weather was worse rather than better, and the course was very heavy. The ground was in a state to make people prepared for a total reversal of previous public running, and they were not disappointed. Generally speaking, races are run over hard or springy turf; when, therefore, horses who have met under ordinary conditions run against each other through mud, their former running is often completely upset. The great race of the day was the Dewhurst Plate, a two-year-old race, worth nearly 2,000*l.* Up to the time of the Middle Park Plate, Bal Gal, who was said to be a roarer, had been the best two-year-old performer of the year. In the Middle Park Plate, however, she had run only fourth to St. Louis, to whom she was giving 4 lbs., Town Moor being second and Lucy Glitters third. Now, in the Dewhurst Plate, St. Louis was to give Bal Gal 6 lbs. instead of receiving 4 lbs. from her; but as the distance was to be seven furlongs instead of six, it was believed that the roarer would not be able to make way even on 10 lbs. better terms than those on which she had met St. Louis in the Middle Park Plate. Town Moor was now to meet Bal Gal on the same terms as in the Middle Park Plate, so, on public form, he was bound to beat her, and Lucy Glitters was to run under like conditions; but, although she had beaten Bal Gal in the Middle Park Plate, it was thought that this might have been owing to Bal Gal's jockey easing her when he saw that all chance of winning the race was gone. Brag was also to run in the Dewhurst Plate, but, after his form in the Criterion, his chance was naturally regarded as hopeless. It had been generally understood that Bal Gal had lately become a worse and worse roarer; and a course, therefore, of unusual length was considered most unsuitable for her, especially when the ground was exceptionally heavy. The result falsified all these calculations. Bal Gal won. This of course seemed wrong. The disgraced Brag made a fine race with her. This, on public running, seemed more erroneous still. Lucy Glitters was close up to Brag; in fact, there was only a neck between each of the three leading horses. That Lucy Glitters should beat St. Louis, who was fourth, appeared puzzling. Then Sir Marmaduke, who had won the Prendergast and been third in the Criterion, was absolutely the last horse in the race. Altogether the Dewhurst Plate was a complete upset of previous form; but, when the state of the ground is considered, this result does not seem so wonderful. The extraordinary part of the matter is that Bal Gal should have run so well through heavy ground over a long course, if she is a roarer. If Bal Gal is not a roarer, it does not seem so inconsistent that she should beat St. Louis when meeting him on 10 lbs. better terms than in the Criterion, and the effect of St. Louis's extra weight must have been almost doubled by the condition of the course. After the fine contests of the previous day, the majority of the racing on the Wednesday was poor indeed. The most leniently weighted horse in the first race won by twenty lengths, and each of the next races was won by several lengths. Then came a hard struggle, in which victory was won by a head only; and in the Dewhurst Plate, which followed, there was, as we have already observed, a very fine race. The four succeeding races were all won with ease, the favourites being beaten in three cases out of four. Indeed, out of the nine races which were run during the day, the favourites only won in two instances. During the morning Robert the Devil was brought out for sale, but nobody offered any advance on his reserve price of 12,000*l.* This was certainly a substantial sum; but it must be remembered that Doncaster, who had not done so much to deserve it, was sold for 14,000*l.* when a couple of years older. Lord Rosebery's horses sold but badly. Moorfoot, who had cost 6,000 guineas two years ago, now went for 135 guineas. This horse is better known as Bonnie Scotland, and it may be remembered that he started second favourite for the Derby of 1878. Visconti, who ran third for the Derby last year, was knocked down for 75 guineas. It is said that both these horses were purchased to be sent abroad. Some really useful racehorses in training were sold for prices varying from 200 to 700 guineas.

The weather improved slightly on the Thursday, but it was very showery, and, if possible, more muddy than ever. The sport was not quite of the best quality, but there was a great deal of very pretty racing. There was a capital race between May Queen and Lancaster Bowman in the Coffee-Room Handicap, the former just managing to hold her own and to win by a head after a brilliant rush by Lancaster Bowman. The Subscription Stakes was a match between the Duke of Westminster's Douranee and Lord Rosebery's Myra. Douranee is a three-year-old. Last year she had been a performer of high class, winning nine races out of thirteen; but this year she had run badly. Myra is a two-year-old, and she shows a good deal of quality. The pair met at weight for age, and the two-year-old was the favourite; but Archer brought up Douranee exactly at the proper moment, and won the race by half a length. There was a good race for a two-year-old selling plate which followed. Fourteen horses started, and Jessie, the first favourite, won by a length, but only after a hard fight, and the third horse was but a head behind the second. The Bretby Nursery turned out a better race still. There were eighteen starters, and Heyday, the favourite, seemed to be winning, when he swerved, and Foxhall, who had won the Bedford Stakes at the Second October Meeting, collared him, and beat him on the post by a head. A horse called Accelerato was third, only a head behind Heyday. This was not a bad performance on the part of Foxhall, as he was giving Heyday 2 st. At the same time, it must be allowed that many good judges of racing were of opinion that the victory was accomplished entirely by good riding. The Free Handicap Sweepstakes, which ought, theoretically, to be one of the most interesting races of the year, ended in a very poor affair. The best public performer among the starters was Apollo, but, as he was giving from 14 to 20 lbs. to each of his opponents, he was quite outweighted in the heavy ground. Poulet was made the favourite, and he won, but only after a severe race with Master Waller, whom he beat by a head. A filly of Lord Hartington's, who was first favourite, won the Feather Plate by a length, after a good race. Savoyard was made first favourite for the Troy Stakes, but, when he seemed to be winning, he suddenly ran in a very cowardly manner, and Archer brought up the Duke of Westminster's Thora with one of his dangerous rushes, and won by half a length. This was the second time during the day that a horse of the Duke of Westminster's, with Archer on its back, had rushed up at the end of a race and beaten a horse of Lord Rosebery's by half a length. In the next race, again, the Duke of Westminster and Archer were successful; and again the Duke beat a lord of his own politics. Considering the indifferent running of Douranee during the summer it was much to her credit that she should win two races in one day. At the sales in the morning there was a curious instance of the vicissitudes of the turf, when a horse called The Dwarf, who in 1871 won the Great Northern Handicap and the Great Yorkshire Handicap (races worth, between them, more than 1,000*l.*), was sold as "a good hack, and quiet in single and double harness," for 25 guineas.

It was rather finer on the Friday than during the three preceding days; but again there were heavy showers, occasionally accompanied by a cold north-easterly wind. But few people came to see the races. Thebais had only Lennoxlove to beat for the Homebred Foal Post Stakes. For the Post Sweepstakes Town Moor beat St. Louis; but, as he was receiving 9 lbs. and only won by half a length, it was much the same as a beating at even weights. 3 to 1 was laid on the wrong horse for a match, and then came the All-aged Stakes. Hackthorpe and Douranee were equal favourites at 6 to 4. As much as 4 to 1 was laid against Océanie, who had not been out before this season. In these calculations a terrible mistake was made. Hackthorpe was out of form, and Douranee was tired after her two races of the previous day, so Océanie won easily. Last year Océanie won each of the three races for which she started, so she has never yet been beaten. That good horse Chippendale won the Jockey Club Cup with great ease. There was a grand race for a sweepstakes between Grand Flaneur and Tower and Sword, the former winning by a

head; but, taken as a whole, the racing was poor on the Friday, and the fields were very small compared with those on the opening day. Only nine horses ran for the first four races. In point of weather, the late Houghton Meeting was one of the most disagreeable within living memory, but there were a great many finely contested races during the week.

REVIEWS.

THE EARLY HISTORY OF CHARLES JAMES FOX.*

AFTER the lapse of more than seventy years, and the failure of several previous attempts, Fox is at last fortunate in a biographer. Mr. Trevelyan says, in a faintly complimentary tone, that he could scarcely have accomplished his task without the materials supplied by Lord Holland and Lord John Russell; yet it is difficult to account for the extraordinary badness of the compilation for which they are jointly responsible. They both possessed great ability; they had both literary aptitude and experience; and they were almost equally attached to their hero by political admiration and sympathy, and one of them by deep personal affection. All materials within the control of Fox's friends and family were at the disposal of the two writers in succession; and it is difficult to say whether the nephew or the eventual successor of Fox was more deeply imbued with the orthodox Whig tradition. Lord Holland's fragmentary anecdotes are more valuable than Lord John Russell's comments; but the barrenness of his recollections is surprising. The extracts from Fox's correspondence are in many instances so little creditable to the writer as to suggest a doubt whether the selection is to be attributed to carelessness or to candour. Mr. Trevelyan is a literary artist of a higher order, and notwithstanding the lapse of a second or third generation, his enthusiasm for the great Whig orator is more indiscriminate, if not warmer, than the devotion of Lord Holland or Lord John Russell. The present volume, which records little of Fox's life except his youthful faults and follies, teems with hints and suggestions of the future wisdom and greatness which it will be Mr. Trevelyan's business to disclose. If his work were the first instalment of a romance, the expectant reader would wonder whether the future Henry V. could possibly redeem the promises which are to procure condonation for the errors of the Prince of Wales. His biographer has undertaken to prove that in his maturer career Fox seldom made a mistake, and that he mainly contributed to the creation of a new and better political era. As the story is not a fiction, but a history, those who already know something of its course and tendency will not be the last to admire the enterprise of the daring biographer, and to applaud him if they witness his final success. His first essay will have excited and justified an interest which he will perhaps sustain to the end. Mr. Trevelyan had already shown his command of a highly attractive style. Copious, rapid, invariably clear, and on fit occasions humorous or eloquent, he is one of the most readable of modern writers. A mannerism into which he still sometimes lapses always seems to be a lingering echo of Macaulay. Mr. Trevelyan, when he is not subject to foreign influence, is too fresh and too full of life to adjust his thought and language to an artificial model. He rarely falls into careless inelegance; but he would do well to correct one or two colloquial or inaccurate phrases. The conjecture that Lord Weymouth would, in a certain contingency, have "levanted" is not expressed in English. The statement that Devonshire "marches" with Dorsetshire is Scotch.

Fox's exploits in private and in public to the age of twenty-five would scarcely have provided subject-matter for a volume of more than five hundred pages. Mr. Trevelyan has taken the opportunity to relate much of the political history of the time, and to describe with not unsympathetic sarcasm a state of society which, as he says, must have been greatly enjoyed by those who shared its advantages. No writer more fully appreciates the enviable position of the English aristocracy in the middle of the eighteenth century, when their supremacy was undisputed, and when their party struggles possessed for themselves and others a personal interest. In describing their morals, which were undoubtedly too often lax, Mr. Trevelyan tends, if not to exaggeration, at least to partiality in selection. He sometimes borrows the spirit as well as the statements of the satirists whom he quotes with too implicit a faith. Junius and Churchill are the least authentic witnesses against the characters of the many objects of their hatred. Even Sandwich may not have been so bad as his reputation; or, at least, he had redeeming qualities. It was when he was in deep distress on account of the gravest scandal and worst misfortune of his life that Fox moved an Address for his dismissal from the Royal councils. On the whole, Mr. Trevelyan's moral indignation is not undeserved; but, if the statesmen of the time practised corruption, and if some of them used their influence to acquire places and pensions, many of them were too rich to be bribed, and many were too high-minded to care for money in the contention for power. Not only Chatham, but Temple and Grenville, were exempt from the suspicion of corrupt motives and acts; and they, and many of their contemporary rivals, might be more plausibly accused of factious caprice in resigning and refusing office than of clinging unduly to its emoluments. The Duke of Newcastle, who in another relation was more immediately connected with Parliamentary corruption than any other statesman of his time, impaired his great fortune during forty-four years of office. Henry Fox, who was not without reason reputed the most grasping placeman of his time, seems not to have exceeded his legal right in profiting by the balances in the Paymaster's hands, although Pitt before him, and Burke at a later period, declined to make a questionable profit. Mr. Trevelyan's assertion that Fox and his allies purified the principles and practice of statesmen is hitherto supported by no evidence beyond the terms and effect of Burke's celebrated Act which was passed during the short Rockingham Administration. The change which undoubtedly took place between 1760 and 1810 may be at least as fairly attributed to the unsullied purity of Pitt as to Fox's denunciations of official corruption.

Candour and approximate impartiality in the estimate of historical characters are a result of time as well as of Mr. Trevelyan's genius. The partisanship of Macaulay's earlier writings was already becoming obsolete when, with a sincere desire to do justice to an opponent, he wrote the Life of Pitt. It was rather through an inveterate propensity to antithesis than in consequence of political prejudice that he extolled the first half of Pitt's career in contrast with the supposed failure of his later efforts. Mr. Trevelyan conforms to modern custom in allowing that some of Fox's political opponents may have had merits of their own. His character of George III., to whom he rightly attributes a strong and narrow understanding, is not wholly unfavourable. He appreciates the King's courage, his temperance in a dissipated age, and his untiring devotion to business. The King's attempt to assert his own power against the dominant aristocratic factions was condemned by its ultimate failure; but Shelburne, and to a certain extent, Pitt, sympathized with the experiment. It must be admitted by the King's apologists that on special issues he was, through a bad education and in the absence of sound advice, during the first ten years of his reign, almost uniformly in the wrong. For the policy of obstinately prosecuting the American war he was not exclusively responsible. In the first instance he had disapproved of George Grenville's Stamp Act, and he afterwards favoured a modification of the demand on the colonists. After the rupture he persevered in the struggle with the full assent and approval of the great majority of his subjects. There is no historical fact better attested than the approximate unanimity of the English people in deprecating the first disruption of the Empire. It would have needed a more tolerant temper and a more comprehensive intellect than that of George III. not to be irritated by the declamation in which Fox and his associates always included the King among the accomplices of the Ministers whom they daily threatened with the scaffold. Mr. Trevelyan boldly finds fault with Chatham for "declaiming against the most modest and long-suffering set of statesmen that ever did the King's business as 'the proudest connexion in the country.'" In the same sentence, Mr. Trevelyan praises the Duke of Richmond for telling Chatham "that the nobility would not be brow-beaten by an insolent Minister." It was as the most powerful section of the nobility that the Whigs under Rockingham, as under Newcastle, claimed the authority which George III. considered to be rightfully his own. On the death of Rockingham, Fox demanded the right of setting up an unknown Duke of Portland, first as the figure-head of the party, and consequently as the King's First Minister on the accession of the party to power.

Either in preparation for his present task, or perhaps in accordance with a laudable taste for one of the most amusing branches of literature, Mr. Trevelyan has saturated his mind with the memoirs, diaries, and correspondence which furnish the principal materials for the social and political history of the time. He gives just praise to the Life of Shelburne, which nevertheless Lord Edmond Fitzmaurice would do well to rearrange in a future edition. If he imperfectly appreciates the merits of Horace Walpole, he is not disposed to hold with Macaulay that the best of English letter-writers drew his inspiration from the defects of his own intellect and character. The same luminous explanation was, on the same authority, employed to account for Boswell's superiority to all ancient and modern biographers. Mr. Trevelyan, with not less critical acuteness, is less concerned than his famous kinsman to exercise and exhibit paradoxical ingenuity on irrelevant occasions. Many admirable illustrations both of the early history of Fox and of contemporary customs and modes of thought are derived from the collection of letters addressed to George Selwyn. Mr. Trevelyan, in a not unprovoked burst of virtuous indignation, declares that the Selwyn Correspondence is dreary reading. The severe moralist must disapprove the candid defiance of decency of Lord March, the scandalous proceedings of Charles Fox, and the strange complaisance of Selwyn's led captain, who unfortunately was not really a captain, but a beneficed Doctor of Divinity; but the representation of a brilliant and dissolute society is singularly vivid. It is, as Mr. Trevelyan frequently and forcibly suggests, a wonderful proof of the vigour of Fox's character that he should have attained greatness after eager participation from boyhood to middle life in the worst excesses of the age. His father succeeded by his insane indulgence in making him a gambler and a profligate; but nevertheless Fox was an industrious student before he was immersed in political adventure; and, as he said of himself when he was praised for his skill at tennis, he was always a painstaking man. More surprising than the energy which was unimpaired by his

* *The Early History of Charles James Fox.* By George Otto Trevelyan, M.P. London: Longmans & Co. 1880.

vicious habits was the simplicity of taste which enabled him during his later years to find sufficient happiness in domestic life. Few anecdotes are more touching than Lord Holland's description of the tears which trickled down Fox's cheek when he was told that an adjournment of a debate rendered it necessary that he should stay two or three nights instead of one night in town. His devotion to his wife would be a still pleasanter object of contemplation, if his indifference to her honour and to decorum had not allowed him to live with her for several years before he thought it necessary to marry. Nevertheless it is impossible to doubt the truth of Burke's celebrated and regretful saying, that, "to be sure, he was a man made to be loved." To this day, in the judgment of his admirers, of whom Mr. Trevelyan has made himself the representative and the organ,

> He bears no token of the sabler streams;
> And soars far off among the swans of Thames.

The zealous biographer takes pleasure in expatiating on the perversity of Fox's early efforts in the House of Commons. As it was one of his principles to speak every night, he could scarcely be expected always to speak wisely or to choose his side judiciously. From the first he provoked the reasonable distrust of the Minister by his neglect of party and official discipline; and he seems never to have attempted to cultivate the favour of the King. Notwithstanding his marvellous precocity, he was on his entrance into Parliament only a clever boy with a juvenile devotion to the logic which draws correct conclusions from premisses selected at random. His exaggerated violence against the reporters and publishers of debates was perhaps not altogether capricious. A young partisan might naturally accept the extremest claims of Parliamentary privilege, and draw the inference that the representatives of the nation had absolutely appropriated to themselves the powers of the constituency. In one instance where he appears to Mr. Trevelyan to have been unaccountably adroit in supporting an unjust cause, Fox was wholly in the right. For the purpose of defeating a vexatious grant to Sir James Lowther of Crown lands long enjoyed by the Dukes of Portland, an Act had been passed limiting to a period of sixty years the right of the Crown to recall a grant. By a clause in the Act grantees were allowed a twelvemonth within which they might prosecute their claims; and Sir James Lowther naturally commenced proceedings in the Court of Exchequer. In consequence a second Bill, warmly supported by Burke, was introduced to repeal the saving clause. The proposer, Sir W. Meredith, challenged the Ministers to give a reason for refusing protection to the Duke of Portland; but, as Mr. Trevelyan says, "It was never safe to challenge the Treasury Bench for a reason with regard to any question which filled a space in the mind of Charles Fox. Reasons in that luxuriant soil were plentiful as blackberries, and changed their colour at least as often." It is strange that so acute a reasoner as Mr. Trevelyan should not perceive that the Bill conferred a *privilegium* on a private litigant to the detriment of his adversary. Fox's argument was unanswerable. "If the title is taken away by Act of Parliament, why not bring in an Act to take away the estate of any landlord in the kingdom?" Yet Mr. Trevelyan observes that "St. Stephen's had never seen, and in all probability will never see again, such perversity of opinion combined with such acuteness of intellect and intensity of conviction."

It is doubtful whether Fox was right in his strong opposition to the Royal Marriage Bill; and it is certain that he was wrong in the attempt to repeal Lord Hardwicke's Marriage Act, which led to his dismissal by Lord North and to his alliance with the Rockingham Whigs; but it is not worth while to revive obsolete controversies. With a fine sense of artistic fitness Mr. Trevelyan closes his present work at the moment of transition from heresy to the true Whig faith. As Pitt in Lord Macaulay's picture spent one-half of his career in light and the remainder in shadow, Fox, when he went into opposition, emerged from darkness into an after life unclouded by error, though it was never illumined by good fortune.

The first and easiest part of Mr. Trevelyan's task has been successfully accomplished:—

> *νῦν αὖτε σκόπον ἄλλον, ὃν οὔπω τὶς βάλεν ἀνὴρ*
> *εἴσομαι, αἴ κε τύχοιμι.*

If he attains his aim, he will be the first historian who has vindicated all Fox's acts. Mr. Trevelyan will easily show that Fox was a great orator and party leader, and that his impulses were patriotic and generous. He is also prepared to defend his refusal to retain office under Shelburne, his coalition with North, his opposition to Free-trade with Ireland in 1785, and to the Commercial Treaty with France in 1786, and his assertion in the same year that the Prince of Wales was Regent by right. Mr. Trevelyan has already asserted that, almost alone among Englishmen, Fox recognized the rights of the French nation after the destruction of the Crown and the aristocracy. It may be added that he excused some of the worst excesses of the rabble, as when he absurdly contended that the attack on the Tuileries in June 1792 was justified on sound Whig principles. In his private correspondence Fox repeatedly calls Pitt a villain; and he takes pleasure in a fall of stocks, not that he understands the Funds, but because he knows that it causes annoyance to Pitt. When Napoleon was at Boulogne Fox asked why he should take part in the national defence, when, tyrant for tyrant, he saw no reason for preferring George III. to Bonaparte. During the negotiations for peace he confessed that he took pleasure in every advantage obtained by France and in every humiliation inflicted on England. The best defence of offensive words and mistaken acts is that they were not exhaustive of his conduct and character. It may well be that when Mr. Trevelyan has completed his biography he will have a right to strike a balance in favour of its subject; but prudence and justice will require the admission that there is much to extenuate or to explain.

CHINESE AND CHALDEES.*

ONE of the most curious instances of the tendency of the human mind to take things for granted is seen in the views commonly entertained about the Chinese. We have accustomed ourselves to put aside a whole third of mankind, to place it in a separate pigeon-hole as far as possible out of reach and labelled "anomalous," and then tranquilly to repose in the reflection that we have done with China. It has been the universal habit to regard the Chinese as a people apart from all the rest of the world, a race distinct from all other races, as though we accepted the name "Celestials" in the sense of visitors from some other planetary body. The chief interest to most people about China has always consisted in its contrast to other countries. Chinese was a wonderful language simply because philologists could find no word in it that could be traced to the same root as any known word in any other tongue; and scholars amused themselves with discovering in the isolation of Chinese roots an obvious sign of the primitive language of mankind. Chinese civilization, again, was notable mainly in its priority; it was curious to find that many modern European discoveries had been anticipated in the Flowery Land a few thousand years before the Christian era. The same quality of singularity attracted a faint degree of interest to the Chinaman himself. His patient, unwearying labour on his own plot of ground or as a coolie in West Indian plantations formed a remarkable contrast to other agriculturists, and his cunning avarice and occasional gleams of native cruelty gave him an element of the sensational. But here inquiry ended. It was not thought necessary to find any answer to the questions, Whence comes this isolation and singularity? Why is Chinese a language apart? Where did China learn its civilization? Is there really no link between this extraordinary third part of the human race and the other two-thirds? One side of the shield had been accepted as the true metal, and the other side could not be worth seeing. It was granted that everything about China was anomalous; so why concern oneself with the impossibility that anything in common between China and other lands might be discovered? With fatal facility the absence of any answer was taken as a complete solution of all problems.

It must, however, be allowed that there were excuses for letting things rest. The Chinese language by itself interposes sufficient difficulties in the path of inquiry to daunt the boldest explorer. The common statement that there are 80,000 letters in the alphabet conveys an imperfect impression, and is, moreover, practically an exaggeration. Nevertheless, the 8,000 characters in ordinary use, augmented as they are in effect by altered values in different combinations, offer a serious mechanical impediment to the student. This, however, is a small part of the obstacles encountered by the investigator into the early stages of Chinese culture. A much more serious difficulty lies in the fact that the modern written character does not represent the original writing. It is not that it has suffered the ordinary changes and corruptions of long usage—these we are prepared for in all written characters—but that it has been modified of malice prepense by the literary meddling of successive Governments. Official improvements in the alphabet are happily rare; we have heard of a Roman Emperor who turned his hand to coining additional letters, but otherwise State interference with the alphabet is not a branch of legislation which has hitherto found much favour; though the Académie Française, to which Mr. Matthew Arnold is so devoted, has come dangerously near to something of the kind. In China, on the contrary, periodical alterations in the written character have been as much a regular part of the course of things as the renewal of the Mutiny Act in England. M. Terrien de la Couperie, a gifted young sinologue who bids fair to introduce a new era in the study of Chinese, says in the interesting and startling lecture on the "Early History of Chinese Civilization" which he has recently published:—

> The Chinese form of writing, as used in printed books, the *Kiai-shu* of the present day (allowing for certain improvements added under the *Sung* dynasty about the tenth century), dates from the fourth century of our era, but no further back. It is composed of 103 different elements or strokes, the position of which was an imitation of the more rounded and thicker writing, called *Li-shu*, modified by the rapidity of execution, which had become possible through the improvements in the apparatus of the scribe, viz., his paper and hair-pencil. The *Li-shu* had been the official text since the days of the Tsin dynasty, at which time it was devised through the necessity for a uniform system throughout the empire. This again had been preceded by the *Siao-chuen*, a character composed of meagre and monotonous strokes such as were adapted to the materials then in use, viz., a bamboo written on with a stylus. This, again, was an official modification, originating in the same desire for uniformity which had been attempted in the reign of the great Shi-Hoang of the Tsin. The *Siao-chuen* had been modified from the ancient mode of writing called *Ta-chuen*, in which great variations had developed themselves among the different States (independent, eventually, rather than feudatory) which had once been subject to the ancient dominion of the Choeu; but the amount of

* *Early History of Chinese Civilization*. By Terrien de la Couperie, M.R.A.S. de la Société Asiatique de Paris, &c. With Plate. London: Vaton. 1880.

modification had been great, and the attempt failed in its aim. Now from these successive official changes came a great number of alterations in the elements of the characters intended to make them answer more exactly to their signification as shaped by the ideas then dominant, and by the systematic interpretation more or less in vogue; the addition in compound characters of a considerable number of determinative ideographic elements without affecting the sound; all leaving their stamp on the composition of the characters in use. Now it is this stamp which for many years—I must not say for centuries—has been a clog on the steps of European students in their efforts to investigate the true nature of Chinese writing.

The most ancient of these successive forms of writing, the *Ta-chuen*, was a remarkable creation. It was made by the historiographer Shoe Choeu by order of King Shuen, one of the greatest monarchs of the Choeu dynasty. It was intended to consolidate the various feudatory States by means of a literary and linguistic unity, in the place of the confusion of tongues which was arising by dialectical variations:—

In this undertaking [says M. de la Couperie] the written character was reconstructed as one of hieroglyphics. This event in the history of writing, of which the importance is unmistakable, but which has never till now been pointed out, had no small influence on the destinies of the Celestial Empire. If it has in truth aided the spread of the Chinese power, and facilitated its maintenance over a too vast area, it has at the same time been a clog, so far as its action could go, upon its development, in the sense in which this expression is understood among the higher races to whose progress the possession of an alphabet—a thing rendered impossible by this event among the Chinese—has contributed so immensely.

This return to the hieroglyphic form in the *Ta-chuen* is M. de la Couperie's discovery, and it must be admitted to be one of the most extraordinary facts—for such he proves it to be—in the history of any language. But his researches go back beyond this. By a long and patient investigation of the various means of arriving at a knowledge of the most ancient character of Chinese writing—such as native works on phonetism, ancient rhymes and dialects, the transliteration of proper names, and the comparison of modern Chinese dialects—M. de la Couperie has arrived at the astonishing conclusion, in which he is supported by the authority of Professor Douglas, that the Chinese language, "excessively attenuated as it is now, and disguised by the influence of idioms belonging to a different morphology and ideology, is an ancient member of the great family of agglutinant languages known as Ural-Altaic"—a sister-tongue, in short, of the Akkadian.

How this remarkable conclusion is reached can hardly be adequately explained in a short space; but a few links in the chain of evidence will serve to show the soundness of M. de la Couperie's process. It is placed beyond doubt that the ancient Chinese written character, like the cuneiform, degenerated from original hieroglyphics. The marvellous similarity of the signs for a variety of common things—such as "family," "bull," "black," "region," "son," "tile," and "eye" (the last curiously *sloping* in Akkadian as in Chinese)—is clearly shown in the lithographic table prefixed to M. de la Couperie's lecture, after allowance has been made for the difference of the materials employed for the two writings, the soft clay of the Akkadians naturally requiring a different tool and a different style of writing from the hard tablets of bamboo of the Chinese. A remarkable agreement is seen in the full-face drawing of the images in China as in Chaldea, in contrast to the profile hieroglyphs of Egypt. The hieroglyphic value of these ancient Chinese characters is unfortunately not known in any large proportion; but enough are preserved to show that in sound and meaning, as well as form, they closely agree with the Akkadian. M. de la Couperie gives a list of fifty of the commonest words of the two languages which show a consistent relation. Thus "to shine" in Akkadian is *mul*, in Chinese *mut*; "to die" in Akkadian *mit*, in Chinese *mut*; "book," A. *kin*, C. *king*; "cloth," A. and C. *sik*; "right-hand," A. *zag*, C. *dzek*; "hero," A. *dun*, C. *tan*; "earth," A. *kiengi*, C. *kien kai*; "cow," A. *lu*, *lup*, C. *lub*; "brick," A. and C. *ku*, &c. It is evident that the languages as well as the characters are closely related.

That the character and language did not originally arise among the Chinese themselves is shown by the fact that they had lost most of the symbolic values of the hieroglyphs at the earliest period—that period to which they refer all their inventions, science, and arts, the legendary time of Nai Hoang-ti or Nai Konti, whose name singularly recalls that of Nakhunta, the chief of the gods, as recorded in the Susian texts; a name, moreover, which was given to all the kings of Susa, just as Nai Hoang-ti's Minister, Dum-kit, resembles Dungi, King of Ur. The coincidence is rendered still more remarkable when we are told that the Akkadian characters forming the name of Dungi mean "the man of the bamboo tablet," and that the earliest Chinese character for his name means "carver of wood." M. de la Couperie has collected a large number of instances of resemblance between the Chinese and Chaldee vocabularies. The names of the four cardinal points, the practice of divination by arrows, the duodenary arrangement of provinces, and many other things, are precisely similar in the two countries as recorded in their oldest documents. It is, however, unnecessary to recapitulate them here. The deduction from such resemblances, added to the fact that the original meanings of the hieroglyphs were already in part forgotten when they were introduced into China, is that "a certain number of families or of tribes, without any apparent generic name, but among whom the Kutta filled an important position, came to China about the year 2500 B.C. These tribes, which came from the west, were obliged to quit the neighbourhood, probably north of Susiana, and were comprised in the feudal agglomeration of that region, where they must have been influenced by the Akkado-Chaldean culture."

That such an amazing discovery as this ought to receive mature investigation before its accuracy is admitted will be demanded by every philologist; but it is difficult to read M. de la Couperie's lecture without being impressed with the conviction that he has really made one of the greatest philological discoveries of the day, and that at length the point of union so long despaired of between China and the rest of the world has been found. A practical test of the soundness of M. de la Couperie's conclusions has been tried in the paper he read before the Royal Asiatic Society on the Yh-king. This pre-eminent sacred book of China has puzzled all commentators, from Confucius downwards; but under M. de la Couperie's treatment, explained with his knowledge of the most ancient language of China, it becomes, at last intelligible. At the beginning of chapter xxx., for example, is a hieroglyph of a horned mammal, described as meaning a cow, with the sounds *dip* and *loep*; and then follow six lists of characters, of which the commentators have made no connected sense whatever. As a matter of fact, however, these characters represent a series of the meanings of the hieroglyph at the beginning expressed phonetically, some of which still exist in Chinese, though many are lost, only, however, to be recovered in the cuneiform syllabaries. This is a searching test of M. de la Couperie's work, and more examples of its results will doubtless appear in the book by the same author which is now advertised as in the press, *Le Yh-king et les Origines Asiatiques Occidentales de la Civilisation Chinoise*. But, as it stands at present, set forth in the *Early History of Chinese Civilization*, the theory seems well enough founded to challenge criticism, and marks a new departure in Chinese scholarship.

McCARTHY'S HISTORY OF OUR OWN TIMES.*

MR. McCARTHY has finished the laborious and difficult task which he set before him. He has written the history of England during the reign of Queen Victoria, and he carries his readers to the general election of the present year. It is a very remarkable undertaking to have really carried out. To plan such a work is not a great feat; to make some progress in it is what many literary men of ability could have managed. But to have begun at the beginning and gone on to the end, to have got through his four volumes, and to have got everything he wished to get in within the compass of four volumes, is a great success. But to have made his work complete is only a part of the success which Mr. McCarthy has achieved. The first condition which a history of our own times must fulfil is, no doubt, that it should be a history of our own times, that it should tell us all we want to know, should tell no more, and should treat everything in the right perspective, so that the due amount of space and importance may be given to each successive event, or group of events. The next condition is that it must be fair, that contemporaries should be neither puffed nor maligned, that actions should be fairly interpreted, and that the author, while letting his readers know his opinions, should do justice to the side which he does not adopt. The third condition—indispensable, but hard to fulfil—is that it should be entertaining, that the writer should have a good style and write well throughout, that he should perpetually make himself felt by his readers as being himself and no one else, and yet that he should avoid paradoxes, mere smartness, and the appearance of making epigrams to order. All these conditions Mr. McCarthy has fulfilled. His work is fairly exhaustive; but it cannot be said that it is ever prolix. There is, perhaps, a little hurrying towards the end; but, on the whole, it may be said that the right degree of importance is given to the right things. Then it is eminently fair. Of course an author could neither feel nor impart interest unless he had definite opinions which colour his judgment. Mr. McCarthy as a writer is a moderate Liberal, and he views the history of our times from the point of view which is natural to a moderate Liberal. But, if he is a Liberal, he is moderate. If he does justice to Mr. Gladstone, he does equal justice to Lord Beaconsfield. He criticizes Lord Russell and Lord Palmerston as freely as he criticizes their opponents. Outside the sphere of literature he is a member of Parliament, a Home Ruler, and has lately joined the Land League. But a book is a book, and must be criticized by what is found in its pages, and not by what is known of the author outside his work; and in his book Mr. McCarthy is temperate, reasonable, and judicious. Lastly, his History is eminently entertaining, and his power of entertaining his readers never flags. He never seems to be exhausted, and his fourth volume is perhaps the best of the set. To say that this work is as pleasant and attractive to read as a novel is to pay a great compliment to novels. Almost every page has something in it that is good because it is at once unexpected and yet not forced. The book is pervaded with a gentle spirit of subdued fun, and yet it is never frivolous or comic. Mr. McCarthy has not only the art of story-telling, but makes his narrative sparkle with happy hits, and yet these happy hits do not eclipse the more modest bulk of the story. There are so many bad books which must be criticized severely that it is refreshing to come across a book which may be freely praised; but it is difficult to see what more there is to say in praise of such a book as Mr. McCarthy has written than that it is complete, well-proportioned, temperate, and lively.

* *A History of Our Own Times; from the Accession of Queen Victoria to the General Election of 1880.* By Justin McCarthy, M.P. Vols. III. and IV. London: Chatto & Windus. 1880.

Mr. McCarthy's third volume occupies the ground between the beginning of Lord Palmerston's Chinese war and the death of Lord Palmerston. It embraces as intermediate subjects the Indian Mutiny and the American Civil War, and in Continental matters the Italian war of 1859, the Polish insurrection, and the German war against Denmark. The story of the Lorcha *Arrow* and of the war which grew out of its seizure is a subject in the treatment of which Mr. McCarthy is seen at his best. The whole thing was so absurd that a writer who has a fund of gentle ridicule at his command is sure to succeed in describing what happened. The Indian Mutiny is a much more difficult theme. The historian of our time has to tell a painful story, familiar in its outlines, but confused in its details; and, while he must dwell at length on events so numerous and important, he has to pin himself down so that what he says may be in proportion to the whole of an extensive work. Very much of the story is necessarily personal. There are tales of suffering, of heroism, of folly or wisdom, which must be told, and which are tales of the actions and fortunes of individual actors in a great drama. These tales light up the general narrative, and so far make it easier to write. But, if they enliven it, they also swell its volume, and it requires nice art to bring these individual actors into due prominence and yet to hold tight the reins of narrative. From the opening description of the Sepoy to the description of the new Government which replaced that of the Company—that is, from the first beginning to the last end of the Mutiny—there is matter which Mr. McCarthy gets into less than a hundred pages, and yet it would be hard to point out any incident that ought to have been noticed and is not noticed, any question of policy that is not adequately discussed, or any act of heroism or freak of passion which is not so introduced as to bring before the mind sufficient illustrations of the lives, the sufferings, and the conduct of Englishmen and Englishwomen in the dreadful time of trial. The fourth volume takes us from the death of Lord Palmerston to the opening of 1880, and deals with topics so varied as the Jamaica insurrection, Fenianism, the Reform Bill of Lord Beaconsfield, the startling measures of the Gladstone Government, and the foreign policy of Lord Beaconsfield. On each of these subjects there is so much to be said that the only difficulty is to know what to say and how to say it. That all his readers will agree with what Mr. McCarthy says on topics of such recent or present interest is impossible. Those, however, who disagree with him will admit that for literary purposes it is much better that a writer should say what he thinks than that he should be vapid and colourless; and few will fail to admire the skill with which Mr. McCarthy puts together what he wishes to say. No reader can omit to notice in what different directions Mr. McCarthy's skill is shown. The power of narration may be the same throughout, but it must be displayed in different forms. To tell the story of the Indian Mutiny is one thing, and to tell the story of the tentative measures, of the curious shiftings, of the odd devices by which Mr. Disraeli led Parliament up to his sweeping and revolutionary Reform Bill of 1867, is another thing; and, if Mr. McCarthy is equal to the former task, he is certainly equal in as high a degree to the latter. We are made to watch the changing scenes of Reform as if we were at a play. It would be useless and wearisome to go through all the topics with which Mr. McCarthy deals, and to attempt to describe how he deals with them. Those only can be noticed which show him at his best, and also show in what different ways he may be at his best; and if other examples equally good might be taken, it would perhaps not be easy to take three better examples than the story of the Chinese war, the story of the Indian Mutiny, and the story of the last Reform Bill.

Mr. McCarthy's fairness, his anxiety to be just while he is discriminating, and to maintain the respect due to great contemporaries while he is pointing the shafts of criticism or ridicule where he thinks they ought to light, are conspicuous throughout his work. Necessarily it is when he is personal, when he is speaking of the actors in the drama of our times, that this fairness is most tested. In the judgment of events or policies, the direction in which judgment leans often does not show the judge to be fair or unfair. It is quite fair in a critic to speak of the Afghan war either as an unwise departure from the safe policy of keeping within our own borders or as a wise precaution against the ambition of Russia. But when an historian judges the conduct and character of men, when he is giving a picture of Mr. Gladstone or of Lord Beaconsfield, and still more when he is painting lesser men whose portraits may be more easily twisted because the reader does not know enough about them to supply at once the necessary corrective, the historian, if he is not penetrated with the spirit of fairness, may easily be led astray by prejudice, by the wish to be brilliant, and by the desire to say what he hopes no one else has said before him. It is one of the standing merits of Mr. McCarthy that his fairness never leaves him. The two portraits on which he has bestowed most pains, and in drawing which he has evidently taken the greatest pleasure, are those of Lord Palmerston and of Lord Beaconsfield. He is free in his criticism, and not sparing of ridicule in doing this piece of work. He lets his readers know how much he objects to Lord Palmerston's escapades in foreign policy, how poorly he thinks Lord Palmerston came out of such messes as the Polish and Danish complications, how unscrupulous Lord Palmerston seems to have been on many occasions in his treatment of men and his management of Parliament. But he places in full relief the other side of Palmerston—his ardent pride in his country, his frank amiability, his vast knowledge of men and affairs. He laughs, with a hearty laugh which his readers feel to be contagious, at the wondrous oddities of Mr. Disraeli, at his oratorical flights—like that in which he described the banner of St. George as having been planted on the mountains of Rasselas—at the reproduction of the wrong edition of the Revolutionary Epic, at the strange stages in the process which Mr. Disraeli called educating his party. But he also takes care to bring to notice Mr. Disraeli's courageous advocacy of his race, his cordial readiness to welcome rising ability on either side of the House, his protest against wildness of revenge in dealing with the Indian Mutiny, his discreet silence during the American war. Lesser men have necessarily less space given them; but, in trying to hit off what ought to be said of them, Mr. McCarthy never lets bitterness or a love of depreciation get the mastery of him. Of the present Lord Derby, for example, he says:—

> He proved to be methodical, sensible, conscientious, slow. He belonged to that class of men about whom Goethe said that, if they could only once commit some extravagance, we should have greater hopes of their future wisdom. He did not commit any extravagance; he remained careful, prudent, and slow.

Or again, in speaking of Mr. Lowe in 1866, after saying that some Conservatives were heard to declare that he was not only the greatest orator, but even the greatest statesman, of the day, Mr. McCarthy adds:—

> In truth Mr. Lowe was neither orator nor statesman. He had some of the gifts which are needed to make a man an orator, but hardly any of those which make a man a statesman. He was a literary man and a scholar, who had a happy knack of saying bitter things in an epigrammatic way; he really hated the Reform Bill, towards which Mr. Disraeli probably felt no emotion whatever; and he started into prominence as an anti-Reformer just at the right moment to suit the Conservatives and embarrass and dismay the Liberal party.

There is nothing profound, new, or striking in these criticisms. They only put effectively and with terseness what would be the opinions of most men of any party as to two of the politicians in the second rank among the statesmen of the day. But, if they give us nothing more, they give us nothing less. The writer does not go out of his way to make a point where no point is to be fairly made. These criticisms do not illustrate the special ability of the writer, but they illustrate his fairness. If Mr. McCarthy were a dull writer, it would illustrate nothing to show that he kept here and there within the limits of moderation; but he is a clever and a lively writer, and it is samples of what may be termed his average performances that best show how he escapes the pitfalls into which clever and lively writers are apt to sink.

A writer who deserves to be called lively merits the epithet, not because he occasionally says lively things, but because the general texture of his writing is bright. Mr. McCarthy entertains us because he is entertaining. To say why or how he produces this effect is not easy; but there are some points in his manner of writing which are so striking that the reader must be aware that at least a portion of the pleasure he feels is due to them. In the first place, Mr. McCarthy is full of literature of all sorts, and is constantly drawing on his memory for illustrations. He is not very particular about the source from which he draws. The parallel strikes him, and he puts it down. He borrows his illustrations with equal readiness from the classics, the old dramatists, Scott, and Dickens. To give instances is in one way to be unjust to Mr. McCarthy; for half the merit of such illustrations depends on the mode in which they are brought in, whether they are so introduced as to seem natural or pedantic, real aids to the narrative or purple patches. For the most part the mode in which Mr. McCarthy introduces his illustrations is free from the reproach of literary artifice. But, although the real value of the illustrations depends greatly on the context, yet the introduction of these illustrations is so marked a feature in Mr. McCarthy's composition that it is difficult to speak of his style without giving some examples. He draws a picture of the unhappy son of Theodore pining away in the strange atmosphere of England, and dying at an early age; and he closes the paragraph by saying:—"'There is little difficulty,' says the grave leech in the *Fair Maid of Perth*, 'in blighting a flower exhausted by having been made to bloom too soon.'" In depicting the attitude of the advanced Liberals to the Whigs in 1866 he says:—"Many Liberals began to speak with more or less of contempt of the Whigs. They talked of these shadows of a mighty name as Thackeray's Barnes Newcome talks of the senior members of his family, his uncle more particularly." When the Duke of Argyll, in his youthful impetuosity, attacked Lord Derby, we are told:—"The peers were as much astonished as the spectators round the tilt-yard in *Ivanhoe* when they saw the strange young knight strike with his lance-point the shield of the formidable Templar." When Mr. Gladstone was beaten on the Irish Education Bill, the great Minister had failed. "Like the hero in Schiller's ballad, the brave swimmer had plunged once too often into the flood to bring out a prize, and had perished." When Mr. Plimsoll had forced the hand of the Government by his burst of pathetic madness in the House, and Mr. Disraeli not only brought in a Bill to satisfy him, but seemed to take credit for having provoked so salutary if unconventional a demonstration, Mr McCarthy adds, "Even if one does call them names," said Mrs. Gamp, indicating her treatment of her patients, "it's only done to rouse them." Then Mr. McCarthy is fond of bringing in a story or a *bon mot*, and good stories and *bons mots* are dear to readers. He gives, for example, the criticism of the sayer of good things who was asked by a French friend to explain who the compound householder was, and described him as the male of the *femme incomprise*. Occasionally, although rarely, Mr.

McCarthy sets himself to compose a deliberately epigrammatic phrase. Thus he says of Mr. Gathorne Hardy, "He was a powerful speaker of the rattling, declamatory kind; fluent as the sand in an hourglass is fluent, stirring as the roll of a drum is stirring; sometimes dry as the sand and empty as the drum." Lord Lyndhurst, devoting himself to the work of inflaming the public spirit of England against Louis Napoleon, is said to be "a graceful and acrid lawyer Demosthenes denouncing a Philippe of the Opéra Comique." Lord Brougham, consecrating his old age to Social Science, is described as "seeming oddly like some dethroned king who occupies his leisure in botanical studies, some once famous commander, long out of harness, who amuses himself with learning the flute." Perhaps none of these illustrations or epigrams is anything very wonderful in itself. None may deserve to be remembered apart from the context in which it appears. But they are numerous and successful enough to be noticed as giving one clue to the pleasure which Mr. McCarthy's History affords.

Mr. McCarthy concludes these volumes, as he concluded the former two, with a sketch of the literary stars of the period he is describing. We do not see that very short reviews of a number of books and criticisms on their writers form a necessary part of the history of the times, or add much to our knowledge or interest. What good, for instance, can it do any one to learn that "A word must be said of the delicate porcelain of Miss Thackeray's work in fiction—her tender, gentle, womanly stories; nor should we fail to record the fact that Mrs. Craik's *John Halifax, Gentleman*, was one of the literary successes of the day"? But we may take advantage of Mr. McCarthy's reference to his literary contemporaries to suggest where in the scale of merit he himself seems to us to deserve to be placed. What Mr. Trollope is among our novelists, Mr. McCarthy may perhaps be said to be among our historians. In both writers there is much the same facility, the same art of arrangement, the same power of analysing and presenting character, the same evenness of execution, the same power of sustaining interest. Both writers survey the life that is around them with the subtle scrutiny of an artist; but both remain always part of the world they are portraying. Mr. McCarthy has none of that power which genius alone bestows—the power of escaping from the position in which an author is placed, and regarding groups of persons and events now from the inside and now from the outside. He always lives and moves in the world of common sense. Perhaps it is only by a writer of such a cast of mind that a history of our own times can be satisfactorily written. Genius seems to require for historical purposes something of a shadowy past, in which imaginary characters can be freely created, where the impossibility of assigning indisputable motives permits any motives to be assigned, and where a brilliant philosophy can find the examples by which it is to teach, and decide on the teaching which the examples are to prove. It is hardly possible as yet to treat Mr. Gladstone and Lord Beaconsfield as if they were Mary Stuart or Cromwell. Imagination may show us a history of our own times very different from that which Mr. McCarthy has given us, and altogether superior to it. But in real life what we have got is Mr. McCarthy's book, and while we do not see our way to getting anything else, we may be highly satisfied with what we have got.

THE REBECCA RIOTER.*

IN the story before us we have an interesting description of the famous Rebecca riots of nearly forty years ago. So little is commonly known of the history of the times which fall just without a man's own memory, that to many a reader, we may be sure, Miss Dillwyn's novel will open a new passage in the annals of our country. The writer of a tale does not, of course, either keep strictly to facts or aim at including everything that occurred. If Miss Dillwyn does not in her narrative ever wander far from that which really happened, nevertheless there are considerable omissions in her story. She wishes to describe the riots from the point of view of those who took part in them. Though she is, on the whole, very successful in this attempt, yet she does not make the best of her case. Her agitator, who goes about rousing the people in secret meetings, has somewhat too much of the ordinary type of the platform orator of large towns. He does not dwell enough on the undoubted and great grievances under which the people were suffering. We should be slow to believe that the frothy kind of talk of which Mr. O'Donnell is so perfect a master would have touched the simple-hearted Welshmen. We could believe that we are reading extracts from the speech of one of the silliest Home Rulers when we read of "flinging back every attempt of the English tyrant to grind her under his heel." For the most part Miss Dillwyn succeeds very well in making her style correspond with the position of the Welsh peasant who is supposed to tell the story; but apparently she could not resist altogether the temptation of being eloquent now and then on her own account, and so we find her make this same agitator ask the wild, untutored men around him, "Have we degenerated?" So big a word, accompanied as it is by one or two scarcely less big, would indeed have puzzled his hearers. How ignorant they were is in the course of this same meeting shown in a way that has a considerable touch of humour about it—a humour that is heightened by the quaintness of the Welshman's English. Ever since, by the way, we first made the acquaintance of Fluellen, we have had a liking for the dialect; and though the Captain and the Rioter do not always agree in their talk, yet we may say that their words "are all one reckoning, save the phrase is a little variations." The orator had been making an attack on the Queen and her Ministers, saying how they were "rolling in luxury and riches—eating and drinking at one meal what would keep a poor man's family in comfort for a month," and so on. He pointed out that, "if any one is fined, or put to prison, it is to please her, and her name is on every warrant that is issued." The poor Welshmen listen with humility to this lesson on the Monarchy and the Constitution:—

> Tom Davies was sitting two off from me, and he whispered to me when Beynon stopped: "I was not know for sure what be the Queen, Evan; was you?"
>
> "Well—no—not to be quite certain sure," answered I—also in a whisper. "But you can see for yourself what a wicked one she must be for to have to do with such goings on."

Now some such talk as this was likely enough used by the Chartist agitators who came into South Wales after the riots had begun, and who tried to turn the violence which had hitherto been aimed only at the turnpike tolls against property in general. But at the beginning of the disorders there was little need of agitation from without. The people were suffering, as the Commissioners who were sent down to inquire into the state of affairs acknowledged, under great and undoubted grievances. The tolls that had to be paid on the by-roads were in many cases so heavy that they rendered it almost hopeless for the small farmers, who were already greatly distressed by a succession of bad harvests, to keep their heads above water. They burned their own lime for manure; but turnpikes were set up on the way to the lime-kilns. Thus a farmer had to pay one shilling for his load of stone, another for each load of coal that he took to the kiln for fuel, and a third for the lime when he brought it back to his fields. In their first destruction of the gates they had the feelings of the magistrates with them. The riot was successful, and the trustees did not attempt to set up these particular gates again. It is by no means wonderful that the peasantry thought that what had been successful in removing one grievance might just as well succeed in removing all the others. By means of a strange interpretation of a text of Scripture—such an interpretation, however, as is common enough even among professed theologians — they found a name for their leader and their party. They went to the Book of Genesis, and there they discovered the first mention of turnpike-gates and of those who were to seize them:—"And they blessed Rebekah, and said unto her . . . Let thy seed possess the gate of those which hate them." Their leader they in each case called Rebecca, and dressed him in women's clothes, while they themselves were Rebecca's Daughters. Hundreds of gates, together with the toll-takers' houses, were burnt in 1842-43. On one occasion even the poor old woman who kept the gate was shot dead. The coroner's jury, themselves in fear of the violence of the mob, returned a verdict "that the deceased died from the effusion of blood into the chest, which occasioned suffocation. But from what cause is to this jury unknown." Before many months had passed corn-stacks were blazing, while Caermarthen workhouse was half destroyed. Arrests were at last made, and a Special Commission was sent down to try the rioters. Much indulgence was shown by the judges, as it was felt that a great and undoubted grievance was at the root of the mischief. Another Commission investigated the hardships under which the people were suffering. In accordance with their Report, a Bill for the Consolidation of Turnpike Trusts in that part of the country was carried through Parliament, and henceforth there was peace in South Wales. At the cost of a serious destruction of property, and of a still more serious breach made in the habit of obedience to the law, the complaints of the people, which had been so long urged in vain, were at last listened to.

Miss Dillwyn, as we have said, tells the story of these riots in the words of one who was supposed to be concerned in them. Her hero is such a man as Barnaby Rudge might have been, if to his simplicity insanity had not been added. He wishes to do what is right, but he had had no one to show him what was right. There were in his young days no schools, and poor lads had no better teachers than the rough and ignorant people to whom they belonged. Something indeed he had learnt from a young lady, the daughter of a neighbouring squire, whose life he had saved when—as is so common a case with heroines—it was endangered by a run-away horse. He does not, as might be at first supposed, in the end marry her. She is set so far above him that, though he worships her, it is in the same hopeless way as that in which a peasant might worship a princess. There is, indeed, no love-making in the story; at all events it is a story without a heroine. We fear that the author is somewhat rash in thus despising the aid of the god of love. However, if the reader will trust our judgment, as soon as the first shock of surprise has passed away, the absence of lovers is felt to be a very agreeable change. In all stories these young people were really becoming somewhat tedious, and were sadly wanting in originality. But to return to our hero without a heroine, Evan Williams. Just as his mind was beginning to open under Miss Gwenllian's teaching, it happened most unfortunately for him that she and her family went abroad, and were away for two or three years. All he wished to do was to please her; but, with her so far off, how was he to learn what would please her? He knew that he must do what was right, or she would be pained; but who in each case was to show him which was the right and which the

* *The Rebecca Rioter: a Story of Killay Life.* By E. A. Dillwyn. 2 vols. London: Macmillan & Co.

wrong course? When the agitator came and made his speech, and when "every one in the room gave a sort of grunt, like there always is in chapel when the preacher is very moving," he had no manner of doubt as to where his duty lay. He joined with the rioters in the fullest persuasion that Miss Gwenllian would have approved of his so doing, and "proud and pleased" he was with himself as he went home after the first night's work. When violence leads to more violence, and in a fight with the police he shoots a man dead, he is not troubled in his mind any more than if he had been a soldier and had killed an enemy in a battle. He discovers, however, to his horror that it was the old Squire, the young lady's father, whom he had shot, and then he resolves to go to her at once, tell her that he had never known who it was at whom he had aimed, and ask her forgiveness. He is utterly careless about being arrested. He manages to get to her, but he altogether fails to make her understand what was his motive in coming; and he is carried off to prison, hearing her old aunt exclaiming in her favourite phrase, which she had often before used in his hearing, "As I always have said, and shall always say, no doubt Providence settles everything for the best." In his cell these words of hers ran in his head:—

Did Providence really settle everything? Certainly it was not I, nor yet any friend of mine, who settled things; for no single thing had happened that I had wished or intended. Perhaps that was because Providence settled them—just as Miss Elizabeth said—and if so, it was very evident that Providence was no friend to me. Providence! What did the word mean? And why should Providence have such a spite against me? Well! The only comfort was that when Providence had done its worst to me and I should be dead, then there would be an end of it all. It was quite clear that what Providence had settled for me was, that I was to be misjudged and hated by Miss Gwenllian, and that I was to be hung; as Providence seemed to be stronger than me, there was no use my grumbling, and I had better think of something else.

But to think of anything else just then was quite out of my power; and I kept repeating the words again and again in a mazed way, and trying dully to understand them: No doubt Providence settles everything for the best. How could it be for the best that I should have shot Squire Tudor, and that Miss Gwenllian should hate me, and that I should be hanged? For whom was it the best? Certainly not for me, nor yet for the old Squire and his daughter. Was it for Providence, then, that it was for the best? Ah, perhaps that was it—for of course every one knew that Providence settles everything for the best!

Overcome either by the perplexity of these reflections or by the excitement which he had undergone, he falls into a brain fever. On his recovery he was tried, and sentenced, not to be hanged, but to be transported for life. He had, he says, a very clever lawyer; but in so clear a case, when he had owned himself guilty, we do not see what the cleverness of the lawyer could avail.

The story is a little spoilt by a piece of romance which the author no doubt added to it in the belief that it would make it somewhat more like the orthodox novel. If she could not provide her readers with love-making, at all events she could fall back upon a long-lost heir. Miss Gwenllian's only brother had been stolen when a baby. Some years later, when he was a lad of fourteen or fifteen, the hero had fallen in with him and taken him to his father's house, and the two youths had become bosom friends. It is a great pity that the author did not exclude this part of her story altogether. If she was bent on introducing it, the least she could do was to be consistent. She should have carried the romance through from the beginning to the end. A hero who first, at the great risk of his life, saves a heroine from death, and then rescues her long-lost brother, could never have ended by shooting her aged father. It should have been, not on his deathbed in one of our convict establishments, but in the old parish church with his bride and her bridesmaids, that we saw the last of him. However, we must be content with what Miss Dillwyn gives us, and thank her for a story of considerable power and interest.

STOUGHTON'S LIFE OF WILBERFORCE.*

DR. STOUGHTON'S little book is the first of a series of popular biographies which are to appear at intervals under the general title of *Men Worth Remembering*. The title may be thought to imply that these worthies are in danger of being forgotten; but as they are one and all, with the exception of Stephen Grellet, favourite heroes and saints of what Sydney Smith called "the Evangelical faction," and as their lives have been and are ever being told and retold over and over again in every English and American Evangelical serial, there is not the slightest likelihood of the suggested casualty. The series is evidently a sort of other-worldly imitation of the series of worldly biographies and criticisms edited by Mr. John Morley under the general title of *English Men of Letters*. The likeness between the two sets of books is outwardly exact—the cover, the size, and the type correspond; but of any internal likeness between the two there is no trace. Although bookbinders and printers may find it easy to emulate one another, no one will expect Dr. J. Stoughton's *Wilberforce* to rise to the level of Mr. John Morley's *Burke*, Dr. C. Stanford's *Doddridge* to equal Mr. J. C. Morison's *Gibbon*, or Dr. D. Fraser's *Chalmers* and Mr. E. Paxton Hood's *Robert Hall* to match with Professor Huxley's *Hume* and Professor Nichol's *Byron*. In addition to the worthies already named we are also promised biographies of Wycliffe, John Knox, Richard Baxter, Jonathan Edwards, Fletcher of Madeley, Stephen Grellet, Harry Martyn, and William Carey. The grand titles of works already published by the intending biographers of some of these worthies do not act upon us magnetically. We are not convinced that Dr. William M. Taylor of New York is signally fitted to deal with so difficult a subject as the life of John Knox because he is the author of *Limitations of Life*; nor does the authorship of *The Young Man's Safeguard in the Perils of the Age*, *Blending Lights*, *Studies in Life*, *The Romance of Biography*, and *The Disciple whom Jesus Loved*, arouse our confidence in the literary, historical, and critical genius of the writers who have undertaken the lives of Grellet, Chalmers, Robert Hall, Carey, and Jonathan Edwards. Great as the fame of all these works may be within a limited and sectarian circle, not one of them is known outside that circle. The only name of any repute in the list is that of Dr. Stoughton. He is a man of much reading; he has compiled a long, respectable, moderately tolerant, but utterly uncritical *Ecclesiastical History of England* during the latter half of the seventeenth century and the early part of the eighteenth; and he has contributed very largely to the *Tendenz-literatur* of the Independent denomination and of the Evangelical religious world. He has a facile manner, and is always readable; and, though we are bound to call him a compiler rather than a critic, we freely grant that his work shows evidence of painstaking and conscientiousness.

We conclude that Dr. Stoughton intended his book to be a critical estimate quite as much as a biography, because its arrangement is only partially chronological. He begins with a chapter on Wilberforce's "Early Days," and closes with one on his "Last Days"; in the intermediate chapters, which deal with Wilberforce as a politician, an abolitionist, a philanthropist, a religious man, an author, a kinsman, and a friend, the order of time is made subservient to the order of subject. We are not convinced by anything which we find in these chapters that there was the slightest need for rewriting the life of Wilberforce. With such plentiful matter as Dr. Stoughton had before him in the Life and the two subsequent volumes of Correspondence edited by Wilberforce's sons, in Mr. Harford's Recollections, and in Mr. J. C. Colquhoun's sketch of the philanthropist and his friends, the compilation of the present volume must have been very easy. Criticism worthy of the name is not to be expected from the writer; the occasional reflections, which Dr. Stoughton possibly supposes to be critical, are such as we should expect from a venerable, cultivated, and amiable Independent minister, who has evidently unlearned and cast off some of his traditional prejudices, but who as evidently retains many which he is not likely to unlearn. The temper of the book, except in a few places and upon one particular topic, is admirable; and its matter is usually trustworthy; but when we turn from its temper and matter to its form, we find that Dr. Stoughton lays much stress upon the adjective in the phrase "popular biography." A popular "biography" may mean one which is intended for the people—a *Volksschrift*; or it may mean one which is likely to please a specific class of book-buyers whom a publisher has in view. Dr. Stoughton's writing is "popular" in the latter sense rather than in the former. He seems to have aimed at the production of a "picturesque" book, and has paid much attention to the scenery, background, and accessories of his subjects. He is a great—or perhaps we ought to say a wide—expatiator. Monmouth reminds him of Macedon. Wilberforce's birth at Hull reminds him that Andrew Marvell was born at Hull, and the parallel which is thus started between these two utterly unlike men recurs to him at intervals during his relation of Wilberforce's life. Wilberforce went to the Grammar School at Hull—"a venerable institution, whose Elizabethan architecture still adorns the town"—as a pupil. Andrew Marvell went to the same Grammar School, more than a century earlier, as a head-master, and "drilled his own son in the rudiments of Latin." Wilberforce was sent to St. John's College, Cambridge; Marvell had been sent to Trinity College, Cambridge. Dr. Stoughton might have added that as Wilberforce went to France while he was a young man, in like manner Andrew Marvell went to France while he was a young man. Wilberforce, soon after he came of age, was elected member of Parliament for Hull. "In this respect," solemnly expatiates Dr. Stoughton, "we find our young friend walking in the steps of the seventeenth-century patriot." The patronizing expression "our young friend" is out of place in literature; it smacks of a Sunday-school address or of a goody-goody lecture on Wilberforce illustrated by the magic lantern. Two years after Wilberforce entered the school at Hull his father died, and the boy was removed to the house of his uncle at Wimbledon. This removal provides the popular biographer with a fresh starting-point for his expatiations. Closing his dictionary of geography at the word "Hull," he re-opens it at the word "Wimbledon." He not only calls upon us to observe the Roman barrows, the scene of so many duels, and the modern volunteer encampment; but he takes us to the parish church to see the monuments, one of which supplies him with a characteristic piece of conjectural biography. "If," expatiates he, "the family sometimes went to Wimbledon Church, whose chancel goes back to the time of Edward IV., the observant lad would scarcely fail to notice the black marble altar tomb of Sir Edward Cecil, who served King James and King Charles in foreign wars; 'and after so many travels,' as the epitaph touchingly expresses it, 'returned to this patient and humble mother-earth from whence he came, with assured hope in his Saviour Christ to rise again to glory everlasting.'" Dr. Stoughton tells us that "there was a good sermon for young William in these quaint and beautiful words" on Lord Wimbledon's tomb. He only gives a portion of the

* *William Wilberforce.* By John Stoughton, D.D. London: Hodder & Stoughton. 1880.

very long inscription. It did not become the instrument of "young William's" conversion, which the writer attributes to the study of the famous *Rise and Progress of Religion*, by Dr. Doddridge the Independent, of whom Dr. Stoughton has also, if we mistake not, compiled a popular biography.

Another of Dr. Stoughton's expatiations has a grain of probability in it. Mrs. William Wilberforce, the boy's aunt, he tells us, "was a lady who had come under the power of the Whitefield movement, which had wonderfully revived Evangelical religion in this country." We do not exactly know what he means by the Whitefield movement. He may mean Whitefield's quarrel with Wesley; or the Calvinism of the former in contradistinction to the more liberal and catholic Arminianism of the latter; or he may mean the wonderful effects of Whitefield's preaching. But neither the one nor the other has any title to be called the only, or even the chief, element in "the revival of Evangelical religion." Wilberforce was sent to Wimbledon in 1768; Whitefield died in 1770, two years later. Hereupon Dr. Stoughton inserts the conjecture, "Therefore it is probable, whilst William was living under her roof, this aunt sometimes drove over to Tottenham Court Road or the Tabernacle to hear the celebrated preacher." His mother prudently removed him from his uncle's house; Wilberforce himself said in later life that if he had stayed there he "should probably have been a despised, bigoted Methodist." Dr. Stoughton is puzzled by the second of these adjectives, and conjectures that "this aunt of his was disposed to strict Sectarianism," and that Wilberforce's expression "must have been pointed at his aunt's ecclesiastical exclusiveness." There was no doubt a sectarian tendency in Methodism in the years 1768-70; but the Methodists were not at that time formal sectarians. But it may surprise Dr. Stoughton to learn that for the greater part of the time which Wilberforce spent at Wimbledon in his uncle's house, his aunt would not have found Whitefield at Tottenham Court Road or the Tabernacle. The famous preacher was in America, where he died in September 1770.

The chapter on Wilberforce's activity and attitude as a politician is better than that on his "Anti-Slavery Crusade." In the latter Dr. Stoughton has been justly anxious to do full honour to Thomas Clarkson; but we wonder that a writer so fond of parallels should have omitted the name of David Hartley, and the similarities betwixt him and Wilberforce. Hartley was a remarkable man, though the English dictionaries of biography take no notice of him. He was the son of the once-renowned "philosopher" of the same name. He was born in 1729, and so was thirty years the senior of Wilberforce. Like the latter, he represented Hull in the House of Commons. He was a frequent speaker, as the *Parliamentary History* shows. He opposed the war with the American Colonies, and was afterwards one of the plenipotentiaries appointed to treat with Dr. Franklin at Paris. The distinction belongs to him of being the first English legislator who moved for the abolition of the African slave-trade, "as a violation of the Laws of God and the Rights of Man." Hartley had another remarkable point in common with the later and more famous member for Hull in the singular sweetness of his voice. A contemporary said of him, "He was peculiarly distinguished above all others in the brilliant melody of his tones." Dr. Stoughton might have expatiated on the fact that, although Hartley did not resemble Wilberforce by living at Wimbledon, yet he lived at Putney, which is the next parish. Hartley was a zealous student of physical science, and a practical mechanician. His invention for extinguishing fires, which he tried upon his own house at Putney, made some stir at the time.

The chapter headed "Authorship" is almost wholly occupied with gossip about Wilberforce's *Practical View*. That once renowned book owed its wonderful success rather to the political eminence and social standing of its writer than to its contents. "Coming from such a man," wrote Thomas Scott, shortly after its first appearance, "it will probably be read by many thousands who can by no means be brought to attend to our preaching or our writings. I do sincerely think," he adds, "that such a bold stand for vital Christianity has not been made in my memory. He has come out beyond all my expectations. He testifies of the noble, and amiable, and honourable, that their works are evil; and he proves his testimony beyond all denial." Dr. Stoughton prepares the reader for what he has to say concerning Wilberforce's book by introducing a loose expatiation about early "Evangelical" literature. After telling us that "Robert Nelson published works pervaded by the tone of thought prevalent in the Anglo-Catholic school," he adds that "William Law's *Serious Call* was stamped with a different character." He could hardly have made a more egregious mistake. He has probably read that Law's latter works were mystical, and he has incontinently attributed the same character to his earlier writings, which, to say the least, were quite as "Anglo-Catholic" as the mild writings of Robert Nelson. Dr. Stoughton is right in speaking of Hannah More as the literary forerunner of Wilberforce. Her *Thoughts on the Importance of the Manners of the Great to General Society* was published in 1788, and her *Estimate of the Religion of the Fashionable World* in 1791; both had run through many editions before the appearance of Wilberforce's book in 1797. Dr. Stoughton has omitted to notice that Cowper originally supposed the former of Hannah More's books to have been written by Wilberforce. "Mr. Wilberforce's little book," he wrote to Lady Hesketh, "if he was the author of it, has charmed me. It must, I should imagine, engage the notice of those to whom it is addressed." A few days later he told the Rev. W. Bagot that the little book called *The Manners of the Great* "is said to have been written by Mr. Wilberforce; but, whether actually written by him or not, is undoubtedly the work of some man intimately acquainted with the subject, a gentleman and a man of letters."

Dr. Stoughton, as an Independent minister, naturally dwells at some length upon the once vexed question of Wilberforce's friendly relations with Dissenters. He adopts the absurdly unhistorical modern term, and calls them "Nonconformists." Wilberforce never fell into this error, for the title Nonconformist was rarely attributed to any and every sect of Separatists or Dissenters before the "Bicentenary" movement of 1862. Hence we find the biographer and the subject of his biography often disagreeing in their nomenclature in the very same page. Dr. Stoughton talks of "the Nonconformist bodies"; Wilberforce, as quoted by Stoughton, always speaks and writes of "the Dissenters and Methodists." Wilberforce was as unlikely to confound the two as he was to imagine that either the one or other were "Evangelical Nonconformists," as Dr. Stoughton calls them. The biographer, in his account of Wilberforce's interest in Indian missions and in the Bible Society, indirectly calls upon us to notice how superior the Dissenters and Methodists of that time were to the Churchmen of that and of later times. Reginald Heber "as a Churchman was prejudiced against Wilberforce's comprehensive fellowship and sympathies." Wilberforce's sons "had no sympathy with their venerable parent in the catholicity of temper which he manifested." Dr. Stoughton dwells at length upon each "eminent Nonconformist minister"—Robert Hall, Jay of Bath, Dr. Leifchild, Andrew Fuller, and Dr. Coke—who had any intercourse with Wilberforce. He even tells us that Dr. Coke, whom he calls "the good man," "had a great wish to be consecrated as a colonial bishop"; but he does not cite any extracts from that impudent begging letter, which has been called the most egotistical letter ever written, wherein this great Wesleyan light offered to renounce Wesleyanism and submit to the Bishops if Wilberforce would procure his consecration as Bishop for India. Carey and Thomas, the Baptist missionaries to India, were brave and heroic men; but when we read the extraordinary extracts which Sydney Smith once reprinted from the journals kept by them during their apostolical travels, we can hardly think that they were more "catholic" or more "liberal" than Bishop Wilberforce or Bishop Heber. For instance:—"1794. *Jan.* 26. *Lord's Day.* Found much pleasure in reading Edwards's Sermon on the Justice of God in the Damnation of Sinners." Again:—"*April* 6. Had some sweetness to-day, especially in reading Edwards's sermon." Both Carey and Edwards are to follow Wilberforce in the series of *Men worth Remembering*. It is very hard for us to conceive that Charles of Bala, the idol of the Bible Society platform, excelled such a man as Heber in being more "liberal," "catholic," "tolerant," or less "exclusive." We find in Morgan's *Life and Labours of the Rev. T. Charles* that about two months before the Wakes he told the teachers in his Sunday-school "to get the children to search the Bible for texts which prohibit directly or indirectly such evil practices as dancing, drunkenness, fornication, &c." When the feast-day came, "Mr. C. began to ask them questions on the points given them to learn. 'Is Dancing, my dear children, a sin?' 'Yes,' said one emphatically, 'it was owing to Dancing that the head of John the Baptist was cut off.' In this way he proceeded with them as to the other sins." The poor harper who had come to play at the feast had to go home with an empty purse and empty stomach; or, as Mr. Morgan puts it in his hagiology, Charles of Bala had "deprived him of the hire of his iniquity." A man who has written an ecclesiastical history of England ought to know that Dr. Porteous, Bishop of London, was not "the metropolitan bishop"; an Evangelical historian ought to call the author of *Theron and Aspasio* Hervey, and not Harvey; and the student of the topography of Hull and Wimbledon ought not to have placed Avignon upon the Rhine.

THE NAVAL BRIGADE IN SOUTH AFRICA.*

DR. NORBURY very frankly admits in his preface that books on South Africa have fallen upon us lately "thick as leaves in Vallombrosa," and he proceeds to add that his excuse for publishing is the familiar "request of numerous friends." But in his case there were exceptional inducements to yield to the prayer, for the friends were his brother officers of the Naval Brigade, with whom he had taken the field both in the country of the Transkei and in Zululand. As he modestly puts it, they were aware that he had kept a regular journal, and probably they had faith in his capacity as a chronicler. At all events Dr. Norbury has written a good book, and we trust it may have the success it merits. But it is undeniable that most readers have had enough of South Africa, though possibly their interest may have been revived by the new war with the Basutos. The chief fault we have to find with Dr. Norbury is that, writing with the knowledge that he had been in a great degree forestalled, he appears at the same time to have ignored the fact. His chapters on the "Kaffir Tribes" and the "Kaffir Country" are excellent in themselves, and, though slight and superficial, are almost exhaustive within their limits. For this very reason, however, they tell us necessarily much that we have heard before, although here and there we have our interest excited

* *The Naval Brigade in South Africa during the Years 1877-78-79.* By Fleet Surgeon Henry F. Norbury, C.B.R.N. London: Sampson Low & Co. 1880.

by some startling piece of intelligence as to Kaffir customs. We hear, for instance, of atrocities in funeral rites which would be appropriate enough to the "customs" of Ashantee or Dahomey, or to Zululand under a Dingaan or a Chaka—such as the slaughter of several leading men that they may attend the soul of their chief to the spirit-land—but which we had not suspected to be of everyday occurrence among the milder-mannered Kaffir tribes in the south. Nevertheless we see every reason to believe that Dr. Norbury's information is trustworthy, since he is evidently not only a man of observation himself, but lived in familiar intercourse with missionaries who were old residents in this country. There seems to be sound state policy in the practice of giving those headmen a lively interest in preserving the life of the chief. At the same time even his favours are sometimes oppressive, and our author relates a customary measure of finance which must strike every one save the victim from the humorous point of view. Owing to the institution of polygamy, daughters are sure to be plentiful in the princely kraal; and when a chief desires to levy a forced "benevolence" on a wealthy subject, he does him the honour of sending him a daughter for wife. The recipient of the high-born lady is understood to acknowledge the courtesy by remitting so many head of cattle in return; so that young women who would otherwise be "eating off their heads" are bartered for the stock that represents a Kaffir chief's civil list. The popular superstitions, too, not only lead to a great amount of bloodshed, from the general belief in witchcraft, and the sanguinary executions which are its consequence, but they may be the cause of grave domestic inconveniences. The Kaffirs hold the doctrine of the transmigration of souls, and pay the spirits of their relatives the doubtful compliment of believing that they have a special affinity for snakes and serpents. So, when some venomous reptile takes up its quarters with a family, in place of killing it they abandon the hut to its use. Dr. Norbury tells a story of a missionary who came near to paying with his life for the delicate consideration of his flock. While officiating at the communion-table, he fancied he heard a hissing sound. Bringing the service prematurely to a close, he peeped below the cloth, where he saw one of the most poisonous snakes in South Africa. His friendly parishioners had had their eyes upon it all the time, but had declined to say anything from motives of delicacy. They thought that the snake must be a relative of their clergyman, and would not interfere in a family affair.

There is of course very little that is new in Dr. Norbury's account of the war with the Gaikas and Galekas. But in that, as in the story of the subsequent campaigning beyond the Tugela, he confirms all we have learned from other sources as to the value of the services of the Naval Brigade. When the native levies were seldom to be depended upon without a strong backbone of Europeans, and when some of Her Majesty's English regiments were said to be largely recruited from immature lads, it was much to have a corps of sturdy men who might be thoroughly trusted for any contingency. Except within the unwholesome *enceinte* of the fort at Ekowe, the sailors generally kept their health; they were always cheerful, they were handy in the management of their guns, and their marching powers did them infinite credit. We are familiar by this time with the story of the game at hide-and-seek which our troops had to play with the insurgent tribes. Though the forests and broken ground which they occupied as their natural fortresses were of limited extent, it was comparatively easy for the skulking natives to elude the arrangements of their enemies for circumventing them. They had spies everywhere, and allies in unexpected quarters. Dr. Norbury attributes the prolongation of the war to two causes in particular—viz. "the complete freedom which we permitted the enemy's women to enjoy, and the liberty which we accorded to the so-called loyal Kaffirs." The women conveyed not only information, but provisions. There could be no reasonable doubt that they were victualling the fighting men; for when they were driving a brisk trade in the bundles of faggots they brought into camp they refused to accept anything but food in exchange. Our author suggests that at the beginning of a native war all the women should be compelled to assemble, and be kept safely together under a strong guard. The plan, no doubt, would be effective if practicable; but we may question whether it would be possible to enforce it under the proposed penalty—"on pain of death"; and he confesses that putting restraint on the "loyal" Kaffirs is matter of even greater difficulty, though undoubtedly the facility with which passes were granted was grossly abused. A native had only to assert his loyalty to have himself inserted on the register, and had only to surrender some old weapon in order to receive a document in exchange which left him absolute master of his movements; and the number of passes found on the bodies of enemies on the battle-fields showed how generally the system was abused. Dr. Norbury bestows great praise on the soldierlike qualities of the Fingoes as skirmishers, and adds that their most zealous exertions may be assured so long as there are cattle to reward them in the way of booty. On the other hand, considering that greed is perhaps the dominating passion of all these savages, the staunch loyalty of the Galekas to their chief seems very admirable. It was known that Kreli was hidden somewhere in the Quora Bush; 1,000*l.* was set upon his head; the Fingoes were out daily spying and reconnoitring, and still nobody came to claim the reward. Yet Kreli had several followers with him, and his subjects brought regular supplies of food to the parts of the bush where he was known to have his lurking-place.

Dr. Norbury gives no uncertain evidence as to the feelings of the colonists with regard to the Zulu war. Almost to a man they held that Sir Bartle Frere had behaved with equal spirit and sagacity in relieving them from a situation that was becoming daily more critical. They believed, with some more impartial observers in England, that it was by no means merely to play at soldiering that Cetewayo had marshalled and drilled his hordes of warlike barbarians. "They knew that any day the least word from the king would slip the leash, and that forty thousand eager savages, whose pride and profession were bloodshed, would pour into Natal and butcher man, woman, and child. There was only a river to keep them slightly in check." They dreaded a general rising of the natives in Natal in sympathy with a Zulu invasion. And some of the settlers on the frontier had heavy stakes depending on the policy the Government might pursue. Dr. Norbury visited one border farm that had been reclaimed by a man who had emigrated from England twenty-five years before, and apparently without capital. He had received a free grant of 600 acres. When he married, his wife brought him as much more by way of dowry; the rest he had gradually purchased out of his savings at 4*s.* per acre. When Dr. Norbury was shown over the place, the farmer and his sons were growing arrowroot, coffee, and indigo. They had created ranges of substantial outbuildings down to blacksmiths' forges for repairing their machinery; and they were selling their arrowroot at 40*l.* per ton, and their indigo at 8*s.* per pound, which we should say were sufficiently remunerative prices. Dr. Norbury formed a favourable impression of another adventurer, who has risen to wealth and consequence in a somewhat different way. At the meeting of the British Commissioners with the Zulu envoys he saw Mr. John Dunn for the first time—"a sunburnt, good-looking man, evidently in the prime of life, and a long residence among the Zulus has in no way detracted from his gentlemanly demeanour." Subsequently he gives a picturesque account of the exodus of Dunn and his tribe across the Tugela after the proclamation of war. On one day 2,500 cattle and about 1,000 people crossed the stream. When all had come over, the men swimming the swift current with their oxen, the encampment broke up, and the emigrants started on their march for the southward:—

> The procession reminded me strongly of the biblical pictures of Abraham and the old patriarchs. There was Mr. Dunn with his wives and concubines, his wild-looking men armed with spears, driving forward the flocks and herds—his women and children, many hundreds in number, carrying their seats and cooking utensils on their heads, and the mothers with their little ones at their backs—a pastoral people migrating from one district to another.

We have already referred to Dr. Norbury's report of the sanitary defects of the fort at Ekowe. The choice of the site had been dictated by military considerations; in other respects it could scarcely have been more unfortunate. It appears that the soil consisted of a layer of black loam two feet deep, formed by the long accumulations of rotted vegetation; beneath was a thin stratum of sand likewise impregnated with organic matter; while beneath both, and preventing the subdrainage of impurities, was a bed of clay saturated with water. It was then the height of the rainy season; the surface was soaked, and under the burning sun there was a constant and malarious exhalation. The men lived and slept, closely packed together, under the low waggon tarpaulins which prevented all ventilation; they were overworked besides, and on short rations. No wonder that they began to sicken and die, and, unfortunately, the stores of drugs were expended. Dr. Norbury did his best with some cases of horse medicine, supplemented by the bark of the water-boom tree, which he found to have powerfully astringent properties. Had the relatives of the beleaguered force known all the circumstances of the situation, their anxieties must have been very seriously aggravated; and though Dr. Norbury says little about his own services, we cannot doubt that he has strong claims on the gratitude of many of the people who may read his book.

SPORT AND PHOTOGRAPHY IN THE ROCKY MOUNTAINS.*

WHERE is a man to turn to who longs for wild natural sport in countries and streams contaminated neither by the "London brewer," the miner, the manufacturer, the preserver, nor the poacher? The world seems almost exhausted, and civilization has crept in everywhere with its pollutions, its snobs, and its Winchester rifles. Our old friend Hawkeye, in Cooper's novels, used to wander west when a plough was to be seen within fifty miles, or the smoke of a settler's cottage could be observed from the top of a high hill. The sight of a fence was poison to him, as to the Red Indians—a class of sportsmen who are dying as rapidly as their wapiti of the disease called civilization. Mr. Williamson, the author of the large and luxurious volume on *Sport in the Rocky Mountains* which lies before us, seems to be, as it were, the last of the Mohicans, the last European who has enjoyed, or is likely to enjoy, the shooting of big game in Northern America, under natural conditions. Mr. Williamson's Highland lease expired in 1878. He says he was "somewhat tired of stalking stags, of which not one head out of ten was worth taking home." He was also aweary of Scotch mists and Scotch midges. Perhaps other sentiments unavowed aided his resolve to seek fresh woods and a new kind of game. Deer-stalking in the Highlands seems to

* *Sport and Photography in the Rocky Mountains.* By A. Williamson. Edinburgh: D. Douglas. 1880.

us, and perhaps to Mr. Williamson, an uncommonly artificial sport. You know, or the "stalker" knows, pretty well how many head there are on the forest. You have your fixed number of killing days, just as if you were a butcher, or a farmer who slays his own pigs. It is a settled thing that so many stags, and no more, are to be shot in the course of the season. Each guest has his allotted number, or, at least, his chance at them. Again, the limitations imposed by the "marches" conflict with the freedom which is of the essence of sport on the grand scale. In the Rocky Mountains Mr. Williamson could follow his grizzly bear or his wapiti as far as he liked. He was never brought up short by a wire fence or a "march." To be sure, the local Red Indians have a theory that the game belongs to them, and, if they can surround a small party of white hunters, they sometimes exact a fine of fifteen dollars for each head. But Mr. Williamson just escaped meeting a large band of Indians when they were drunk and "on the short"; so nothing but the casual discomforts of camp life interfered with his thorough enjoyment of sport in Colorado.

We shall presently give a sketch of Mr. Williamson's triumphs over wapiti and grizzlies, count the points and criticize the heads. But first let the eager sportsman who burns to follow on our author's track, be warned, and note that he is too late. It was on the Eagle River that Mr. Williamson came across the disgusting "sign" of our civilized, enterprising, commercial, and industrial century. The river was delightfully unsophisticated, as clear and full of fish as that commemorated by St. Basil:—

> It was simply the very perfection of a trouting stream. Its waters, clear as crystal, were at this season confined to the middle of the channel, where from grand banks the angler could, free from trees, fish its swirling pools and broad stretches of water; and then its trout—what unsophisticated speckled beauties they were, running from a half to three pounds, and how greedily and fearlessly they took! . . . Here one fly was as good as another. With only a red palmer I killed in a couple of hours as many as I could comfortably carry.

But there were serpents in this Eden:—

> As I crossed a sand-bank one evening I was startled by seeing the fresh print of an American boot. At last the Eagle had been found out; the ever-advancing wave of white settlers had reached its banks. Already the pot-hunter was at work in its pools, and "placer" mining would soon do the rest, converting its pure waters into a stream of liquid mud.

Twelve months before some men had hit on a lode of silver, and in eight months Leadville sprang into being, a city with 30,000 inhabitants, waterwork companies, hotels, schools, churches, three daily newspapers, and all the rest of it. Thus "the poor child of nature," as Mr. Matthew Arnold pathetically says, is hunted from place to place by the children of Mammon. Obermann himself would now find hotels, English schoolmasters, guides, and lawn tennis, in the loveliest scenes where he wandered and maundered. It is more to the purpose that the Leadville roughs, bad stalkers, of course, fire into the brown of the wapiti herds with repeating rifles, and kill indiscriminately stags out of season, fawns, and hinds. Englishmen, who should know better, behave worse. "They simply go to the Rocky Mountains for the purpose of killing all they can, irrespective of age or sex, and then come home, and boast in the columns of the *Field* of the great bags they have made." American sportsmen justly resent this, and speak of asking the Legislature to exclude us as poachers. But meanwhile the deer are perishing, as the buffaloes have perished. Either there must be game laws, preserving, and all other artificial restrictions on sport, or American and English snobs will destroy the game altogether. Do they not drive the deer into corries in Scotland, and fire into the huddled herds at the end of the season? The love of swagger and of publishing a big bag is so strong that we gladly publish the protest of Mr. Williamson:—

> Our kind and hospitable cousins are still prepared, as they ever and ever again assured me, to accord a hearty welcome to those of our countrymen who are content to shoot only such animals as they can in some way utilize; but is it to be supposed they can with equanimity read such an account as lately appeared in the columns of the *Field*, of 400 head of big game slain in four months by one Englishman, of the numbers he must necessarily have left to rot uselessly on the mountains, and the wounded which escaped to die a painful and lingering death?

The spirit of 'Arry has infected English sport. Though we cannot absolve some Americans of similar crimes committed in Scotland, we trust that their Legislature will in future prevent the murderous slaughter of our swaggerers, and of their own pot-hunters. Mr. Williamson's own record he states thus:—

> My bag of big game comprised but thirty-two head, all told. . . . If small, I have at least the satisfaction of knowing . . . that during the whole trip I never shot a stag whose head I did not bring home as a trophy; never fired at a hind; that we only killed such black-tail as we really needed, and that, save in the case of the grizzly bear, we never lost a wounded animal.

Mr. Williamson's outfit "on this side" was not extravagantly heavy. A 500 Express rifle, ammunition, and the ordinary dress of a stalker in the Highlands were all he required. He occasionally stalked in lawn-tennis shoes, which make little noise as you walk. He found a fowling-piece a superfluity, and learned that the explosive bullets which kill a stag in the Highlands with great certainty are found to cause comparatively little inconvenience to a grizzly bear. By an ingenious method of packing Mr. Williamson carried his photographic apparatus undamaged, though donkeys laden with chemicals occasionally rolled down hill with their fragile burden. A donkey train, ponies, a guide, and several servants accompanied the sportsman. The hunting-ground was Piney Range and the mountains in the direction of the hill of the Holy Cross. As the deer are stalked just on the "timber-line" the hunters lived at a healthy altitude of from 11,000 to 12,000 feet. The stags are not free from velvet till the end of August, and the rutting season begins about the middle of September. This limits what we consider absolutely legitimate sport to little more than a fortnight. Mr. Williamson, however, shot some stags in the season when they fill the woods with the noise of their jostling horns in warlike encounter, and with a prolonged shrill whistling cry, unlike the roar of the amorous Highland deer. By the way, Mr. Williamson has solved that vexed question, What becomes of the cast horns of the red deer in Scotland? In the Lews he has seen hinds chewing the stags' antlers. The deer eat their own old horns.

We cannot follow all Mr. Williamson's stalks through a country so beautiful, crowned with snow-peaks, seamed with trout-streams which the beavers dam, rich with flowers and fruits, and free from snakes and insects, that it is justly called "the sportsman's paradise." His first stag, "as big and heavy as a sixteen-hands horse," he killed, after vainly trying to make up his mind to shoot a hind. The stag joined the hinds, and his arrival saved Mr. Williamson from the stain of an unchivalrous act. He found that a shot in the shoulder will not settle a wapiti stag, who needs a bullet in the heart. The head bore thirteen points, the antlers measured fifty-three and fifty-one inches, with a span of forty-two inches. The next head had fourteen perfect tines, and Mr. Williamson publishes a photograph of this splendid trophy. To all but enthusiasts stalking "shop" is even as golf "shop" or whist "shop." To enthusiasts we may recommend Mr. Williamson's spirited descriptions of the almost Indian skill of his guide, who followed a wounded stag for many miles by such small "signs" as a bruised twig or a drop of blood on the grass. Mr. Williamson had the luck to come on a monstrous stag which his guide had observed in the previous year. Now, monstrous stags, like monstrous trout and salmon, generally escape, and, for all we know, attain the age and size of the stag of Redynvre, and the salmon of Llyn Llyw. "The stag said, when I first came hither, there was a plain all around me, without any trees save one oak sapling, which grew up to be an oak with a hundred branches. And that oak has since perished, so that nothing remains of it but the withered stump." As for the salmon of Llyn Llyw, who had fifty salmon spears in his back, he carried Kai and Gwrhyr on his shoulders, and the tale of him is told in the story of the Twrch Trwyth. Such, and so great are the deer we miss, and the salmon that break us, and get away. But Mr. Williamson slew the great stag of the Rocky Mountains, and his antlers were inches fifty-six and fifty-nine, and their points were sixteen. To have shot this stag, and followed a grizzly trail till he faced, and slew "the coming curse," as Mr. Swinburne calls the Calydonian boar, is not to have lived or travelled to Colorado in vain. Mr. Williamson's photographs of stag, mountain sheep (*mouflons?*), dead grizzlies, and scenery at large, are worthy of a book that should be a favourite in every shooting lodge from the Lews to Braemar.

THE TRUMPET-MAJOR.*

MR. HARDY in his latest novel has produced perhaps a finer study of character in a certain sense than he has before given to his readers. His hero, John Loveday, who gives the book its name, is a man who compels admiration and sympathy, and whose simple and noble nature is set before us in the most direct and simple way, revealing itself by actions which seem to him nothing out of the way, and which are left by the writer to speak for themselves without any attempt at what is called subtle moralizing, and frequently is merely pretentious verbiage. This central character is surrounded by others, drawn for the most part with the truth and insight which have raised Mr. Hardy to the high place he occupies among novelists of our time. There is less in this book of the countrymen's talk which has been so attractive a feature in some other of the writer's works; but there is also less of the quaint phrasing, turns of thought, and unexpected similes which sometimes tended to degenerate into affectation. One of the few instances of this tendency to be found in the present work may serve to illustrate our meaning. Describing Miller Loveday's face Mr. Hardy writes that "it was capable of immense changes of expression; mobility was its essence—a roll of flesh forming a buttress to his nose on each side, and a deep ravine lying between his lower lip and the tumulus represented by his chin. These fleshy lumps moved stealthily, as if of their own accord, whenever his fancy was tickled." The overcharged and unpleasant grotesqueness of this is in curious contrast to the straightforwardness of the writer's best manner. Buttresses, a deep ravine, and a tumulus convey no real notion of any human face, and would seem out of place even if applied to such images as Gog and Magog. The miller becomes a living and pleasing character enough as we go through the book; but he is handicapped at first by a description artistically false and far from attractive in itself. To a less degree the same fault is to be observed in the description of Derriman, the miser, of whom we are told that "the edge of his skull round his eye-sockets was visible through the skin, and he had a mouth whose corners made towards the back of his head on the slightest provocation." There is surely no need for the somewhat ghastly detail about the eye-sockets, and a writer of Mr. Hardy's power should learn to avoid mannerisms which cer-

* *The Trumpet-Major.* A Tale. By Thomas Hardy. 3 vols. London: Smith, Elder, & Co. 1880.

tainly add no strength to his work. The method which is of the highest value in Mr. Hardy's descriptions of nature, and of such stirring and lively scenes as the striking of the camp at Overcombe, fails when it is applied as it is in the first description to which we have referred. Such faults as these are far outweighed by the merits of the book, but it would not be well in the case of a novelist of exceptional strength to leave them unnoticed.

The first chapter of the *Trumpet-Major*—the date of which belongs to "the days of high-waisted and muslin-gowned women, when the vast amount of soldiering going on in the country was a cause of much trembling to the sex"—introduces us to two ladies of limited means, living in a village near the Wessex coast. "The elder was Mrs. Martha Garland, a landscape-painter's widow, and the other was her only daughter Anne." They inhabit a part of an old building which from being a manor-house has become converted into a mill, kept by Miller Loveday, already spoken of, with whom they are on excellent terms. The miller has indeed a decided, if bashfully latent, admiration for the widow. The quiet of the village life is pleasantly interrupted at the time of the story's opening by the establishment hard by of a camp, which excites much curiosity and admiration. What manner of woman Mrs. Garland was is indicated by her behaviour under the influence of this agitation:—

Mrs. Garland was of a festive and sanguine turn of mind, a woman soon set up and soon set down, and the coming of the regiments quite excited her. She thought there was reason for putting on her best cap, thought that perhaps there was not; that she would hurry on the dinner and go out in the afternoon; then that she would, after all, do nothing unusual, nor show any silly excitements whatever, since they were unbecoming in a mother and a widow. Thus circumscribing her intentions till she was toned down to an ordinary person of forty, Mrs. Garland accompanied her daughter downstairs to dine, saying, "Presently we will call on Miller Loveday, and hear what he thinks of it all."

Miller Loveday, however, "the representative of an ancient family of corn-grinders whose history is lost in the mists of antiquity," forestalls this intention by paying a visit himself to his tenants, in the course of which he observes:—"You have been looking out, like the rest o' us, no doubt, Mrs. Garland, at the mampus of soldiers that have come upon the down?" and he goes on to say, "Well, one of the horse regiments is the —th Dragoons, my son John's regiment, you know." The conversation further brings out the fact that the miller has another son, Bob, a sailor, who, at the termination of his present voyage, is to settle down on shore and help his father as grinder at the mill. Finally, the miller invites the widow and her daughter to join a little supper-party which he is about to give in honour of his son the Trumpet-Major's reappearance in his native place. The description in a subsequent chapter of Mrs. Garland and Anne each making objections to joining this party, while each is secretly longing to go, is in the writer's best vein. The incidents of the party itself, which the two women finally join, are full of character and liveliness, and the experienced novel-reader may draw his own conclusions from Anne's blushing and being embarrassed when a deaf superannuated corporal reminds her, in the loud voice peculiar to deaf people, of the days when "young Bob Loveday used to lie in wait for ye." The general conversation turns upon the expected invasion of England, as to which various suggestions are offered:—

"The night-time is when they will try it, if they try it at all," said old Tullidge, in the tone of one whose watch at the beacon must, in the nature of things, have given him comprehensive views of the situation. "It is my belief that the point they will choose for making the shore is just over there," and he nodded with indifference towards a section of the coast at a hideous nearness to the house in which they were assembled, whereupon Fencible Tremlett, and Cripplestraw of the Locals, tried to show no signs of trepidation.

"When d'ye think 'twill be?" said Volunteer Comfort, the blacksmith.

"I can't answer to a day," said the corporal. "But it will certainly be in a down-channel tide; and instead of pulling hard against it, he'll let his boats drift, and that will bring 'em right into Weymouth Bay. 'Twill be a beautiful stroke of war, it so be 'tis quietly done!"

"Beautiful," said Cripplestraw, moving inside his clothes. "But how if we should be all abed, corporal? You can't expect a man to be brave in his shirt, especially we Locals, that have only got so far as shoulder fire-locks."

"He's not coming this summer. He'll never come at all," said a tall sergeant-major decisively.

Loveday, the soldier, was too much engaged in attending upon Anne and her mother to join in these surmises, bestirring himself to get the ladies some of the best liquor the house afforded, which had, as a matter of fact, crossed the channel as privately as Buonaparte wished his army to do, and had been landed on a dark night over the cliff. After this he asked Anne to sing; but though she had a very pretty voice in private performances of that nature, she declined to oblige him; turning the subject by making a hesitating inquiry about his brother Robert, whom he had mentioned just before.

The question about Robert leads to an announcement on John's part that his brother is in love. This scene further introduces young Festus Derriman, nephew of the miser already referred to—a personage whose singularly unpleasant character is drawn with much vividness and absence of exaggeration. It might not seem at first that there was much freshness to be got out of, or to be put into, the figure of a young man whose courage and virtue are in inverse proportion to his strength and his disposition to swagger. Out of these materials, however, Mr. Hardy has managed to make a living and novel character. Festus at once conceives an admiration for Anne, and proceeds to persecute her whenever and wherever he can with his attentions, much to the confusion of John Loveday, who on his side has an honest admiration for her, but suffers himself to be cut out by the bullying yeomanry man. Some of the scenes between Festus and Anne are capital, though here and there the humour is a trifle strained. Better still, perhaps, is the scene of John Loveday's first proposal to Anne, after he has received her mother's permission to try his chance with her. He has got his opportunity of being left alone with her, but is so embarrassed by his emotions that "it may be questioned whether he would ever have broached the subject at all, had not a distant church clock opportunely assisted him by striking the hour of three." At this he heaved a sigh of relief and said, "'That clock strikes in G sharp.' 'Indeed, G sharp,' said Anne civilly." Then he goes on to tell how he had a wager with the bandmaster of the North Wessex Militia about the note. "He said the note was G; I said it wasn't. When we found it was G sharp we didn't know how to settle it." From music he diverges as naturally as he can to the advantages of a Trumpet-Major's position, and finally manages to make his proposal, which is practically rejected.

Events now become complicated by the arrival of Bob Loveday, the sailor, who appears laden with presents, none of which he can persuade Anne to accept, and who, some days later, goes off to fetch home his intended bride, Miss Johnson, of whom he knows practically nothing except that he has fallen in love with her at Southampton, and that she has represented herself as being possessed of much gentility and of a rich aunt. On her arrival at the mill curious things happen. When John Loveday comes in she faints, and the next morning she disappears, leaving no clue to her whereabouts or to her reasons for flight. Bob accounts for it on the supposition that "We weren't good enough for her, and she went away in scorn." The father retorts that "She seemed glad enough to get hold of us," to which Bob replies that he who has never been out of Overcombe in his life cannot know "what delicate feelings are in a real refined woman's mind. Any little vulgar action unreaves their nerves like a marline spike. Now I wonder if you did anything to disgust her?"

"Faith! not that I know of," said Loveday, reflecting. "I didn't say a single thing that I should naturally have said, on purpose to give no offence."

"You was always very homely, you know, father."

"Yes; so I was," said the miller meekly.

"I wonder what it could have been," Bob continued, wandering about restlessly. "You didn't go drinking out of the big mug with your mouth full, or wipe your lips with your sleeve?"

"That I'll swear I didn't!" said the miller firmly. "Thinks I, there's no knowing what I may do to shock her, so I'll take my solid victuals in the bakehouse, and only a crumb and a drop in her company for manners."

"You could do no more than that, certainly," said Bob gently.

Subsequently John feels bound to explain that Miss Johnson's disappearance is due to his intervention, because "she was not a woman who could possibly be your wife." Bob, however, expresses in different language Othello's sentiments as to the blessings of ignorance, and goes so far as to start in quest of the missing Miss Johnson; but, moved by better counsels, turns back, to find that the miller, anxious that all the wedding preparations should not be wasted, has hastened his own long-intended proposal of marriage to Mrs. Garland, and has been accepted. There is a difficulty about Bob's presence at the wedding-feast; he feels that he is out of tune for mirth. "Deuce take me," cries the miller, "if I would have asked her, then, if I had known 'twas going to drive thee out of the house! Now come, Bob, I'll find a way of arranging it and sobering it down, so that it shall be as melancholy as you require—in short, just like a funeral, if thou'lt promise to stay." "Very well," replies Bob; "on that condition I'll stay."

We are by this time well in the middle of the second volume, and from this point up to the end incidents of greater or less importance follow each other in quick succession. The false alarm of an invasion leads to various developments both of the plot and of the characters, and in the latter connexion we may call special attention to a scene between the swaggering Festus Derriman and his old uncle's factotum, at a moment when all the military ought to be starting for the coast. Then come the engagement of Bob to Anne, an exciting scene of an escape from a pressgang set on Bob's track by the mean Festus, Bob's period of service under Nelson, and other matters which are so closely involved with the *dénouement* that we refrain from dwelling on them, lest we should spoil the interest of readers. The same reasons prevent us from explaining more fully the character of John Loveday, of which we have already spoken with special praise. The manner of its development, like the many merits of descriptive and perceptive power to be found in the volumes, can be more easily appreciated from reading the book itself than from any amount, however copious, of quotation.

FRENCH LITERATURE.

M. FORNERON, who has already made successful experiments in treating the history of the sixteenth century, has begun a work on Philip II. (1), the first two volumes of which extend to the year 1576. This period of history is one of such general importance that most European nations, in this age of patient examination of archives and documents, have contributed huge masses of documentary evidence for the historian to examine, and few save specialists can hope to estimate correctly the value of each new examination. M. Forneron seems at least determined to show that the superficiality which used to be charged against

(1) *Histoire de Philippe II.* Tomes 1, 2. Par H. Forneron. Paris: Plon.

French historians is a thing of the past. His list of authorities and his citations of them are sufficiently imposing. It must be added that M. Forneron's statements are, for the most part, strictly confined to facts, and that he is very sober in the few expressions of comment and opinion which he permits himself. A chapter on the manners of the Spaniards in the sixteenth century, and one on Don Carlos, may be specially cited in proof of this. The former is not worked up with any superabundance of picturesque detail, but it is graphic and effective enough. The latter exhibits with equal effectiveness the ghastly history of the prince's life and death, not the less ghastly because it is so totally different from the romantic stories—long ago, it is true, known to be wholly fictitious—which have obtained currency on the subject. M. Forneron's simple, but by no means jejune, narrative brings out better than any rhetoric could do the contrast between the high-minded, impassioned, and chivalrous prince of fiction and the deformed, mischievous, superstitious *crétin* of fact. He dismisses the supposition of any interference on the part of the Inquisition as baseless, but seems to have little doubt of the administration of slow poison when the physical incompetence, moral perversity, and mental alienation of the unlucky boy were ascertained.

In giving a *Histoire des mystères* (2) which is the first book on the subject pretending, or that could have pretended, to anything like completeness, M. Petit de Julleville has supplied what was very much wanted. The two volumes before us are indeed only part of a still more ambitious work, which is to include a history of French comedy in the middle ages, a history of the theatre of the Renaissance, and, we suppose, even more still. This *Histoire des mystères* is, however, in itself a considerable work. The task of disinterring old French literature has been going on so rapidly of late years that many meritorious works published in the last century have become practically obsolete, and the quantity of text now at the disposal of inquirers absolutely demands the assistance of a connected history. It is, for instance, only within the last three or four years that the three capital monuments of the *genre*, the great collection of *Miracles de la Vierge*, the huge *Mistère du viel Testament*, and the *Passion* of Gréban have been put—the first two not yet completely, the third wholly—within the reach of ordinary readers. M. Petit de Julleville's book comes, therefore, at a good time. We cannot here examine it in detail; but we may say that, though we have noticed some dubious statements in it, it seems generally correct, and is certainly comprehensive. The plan, indeed, whereby the author in the first volume gives a general sketch of the Mysteries during their five or six centuries of life, and in the second analyses them in detail, involves a certain amount of repetition; but the fault is by no means unpardonable in such a book. Indeed the form of the second volume, which consists of a *catalogue raisonné* of Mysteries and their ascertained representations, is particularly valuable, because it admits of easy supplement as fresh investigations of the rich archives and libraries of France may bring together fresh matter.

It seems that some little time ago, when all Paris was exciting itself about vitriol-throwing, M. Claretie suggested that his friend M. Alexandre Dumas was strangely behindhand in commenting on a subject so germane to his favourite studies. M. Dumas, in reply, hastens to show his friend M. Claretie that he has not deserted his post. *Les femmes qui tuent et les femmes qui votent* (3) is an interesting *plaidoyer* in favour of divorce incidentally and women's suffrage directly. These are, in M. Dumas's highly respectable opinion, the two shortest highways now open to perfectibility. It is, however, extremely interesting to learn, great as have been M. Dumas's projects and performances already, that he has some idea of undertaking a crusade even more daring and more benevolent than any that he has yet attempted. The last sentence of his book contains a promise which cannot fail to gratify all persons, human and superhuman. "Pour le moment," says he, "nous sommes en train de délivrer la femme; quand ce sera fait nous tâcherons de délivrer Dieu." And after this it is probable that people will still continue to talk of Clarkson and Wilberforce and suchlike persons as the chief of emancipators. But we must say that M. Dumas's expectations from the second and most surprising "deliverance" are a little disappointing. "Alors," he says—that is to say, when the two emancipations have been effected—"nous verrons plus clair et nous marcherons plus vite." There really would seem to be something of disproportion between the means and the end. It is fair to say that, besides the preposterous absurdities which never fail to present themselves in any work by this author, not a few flashes of sound sense and keen wit (also as usual) appear. A sort of *lutin*, more capricious even than the famous one in Corneille's case, seems to attend M. Dumas, and to take pleasure in making him devote his talents to the illustration of the most ridiculous crotchets, and occasionally of something worse.

The veteran author of what, though by no means faultless, is certainly one of the best histories of the literature of a nation ever written in a small compass, has in two volumes (4) undertaken a somewhat ambitious task. To give in a couple of hundred pages a satisfactory sketch of any one such literature as those which M. Demogeot handles—even though consideration be limited to its "relation with the literature of France"—needs no small study, and especially no small first-hand study. To give such sketches of all four is certainly a thing which *non contingit cuivis*. Such sketches must almost inevitably be, in part at least, secondhand, and second-hand literary history is foredoomed to error. M. Demogeot seems to us to have pursued the fatal course of looking to see what other critics have said about his subjects, and extracting their opinions with a kind of Livian eclecticism. What can be stranger, for instance, than that a Frenchman speaking to Frenchmen about an Italian should give them the opinion of an English (and not a specially qualified English) critic? Yet this is what M. Demogeot does with regard to Macchiavelli, and the critic he quotes is Lord Macaulay. Hence it is not surprising to find that his facts are frequently as inaccurate as his opinions are doubtful. We open the English part, and we find it stated that Dryden "vécut et mourut catholique"—an odd way of informing French readers that the poet's conversion took place when he was fifty-five. That the date of *Venice Preserved* is given as 1662 might be merely one of those errors of the pen or the press which it is almost impossible wholly to obviate, were it not that Otway is introduced among the heroic tragedians as an example of their "declamatory emphasis." It is needless to say that his great play is the masterpiece of the reaction against these persons and of the return to blank verse and nature. Obviously M. Demogeot has never opened *Venice Preserved*, though he names it. This demonstrable shortcoming makes us naturally dubious as to the authority with which he speaks on other matters, even where his want of it is not so clearly to be shown. It is a pity that the author of some excellent work should thus compromise a well-earned reputation.

M. Paul Stapfer, whose *Shakespere et l'antiquité* was noticed some time ago in these columns, has collected in a volume (5) some miscellaneous essays on detached points of French literature and history. Those on "Les industries de Beaumarchais" and on "La comtesse de Rochefort" will please people who like anecdote and the personal element in literature. The other essays are more purely literary. One of the longest papers in the book is entitled "La poésie française en 1872," and now that the efforts of several English critics have made the *Parnasse* and other modern French poetry somewhat better known in England than it was a year or two ago, this paper should be found interesting reading. M. Stapfer's judgment seems to us very generally sound both as to the merits and the defects of the school and of its opponents. As to the latter, his verdict on M. Maurice Bouchor is admirable. A shorter but equally interesting essay on "Catullus, Chénier, and Musset," deserves mention, and in a notice of M. Paul de St. Victor's *Barbares et bandits* published nearly ten years ago, a view of that brilliant writer not wholly dissimilar to one recently put forward in our columns will be found. In dealing with the late M. Flaubert's *La tentation de Saint-Antoine*, we shall own that M. Stapfer appears to us to go utterly wrong, but this is the only point of serious disagreement between us. Two papers on Mérimée emphasize very excellently a curious idiosyncrasy, and (beyond all doubt) defect in that admirable master of style—to wit, his deliberate affectation of a by no means genuine cynicism—and point out the limitations which this imposed upon his critical powers. Altogether the book is one which, though necessarily of a somewhat desultory kind, contains much interesting matter—matter all the more interesting, perhaps, because the author, though evidently well read and of sufficiently catholic tastes, is very definitely French, even to the point of an occasional prejudice.

Although all humanists, if the revival of that excellent word may be pardoned, must regret the acrimonious quarrels which have arisen over the *disjecta membra* of Saint-Simon's long buried remains, the acquisition of them under whatever circumstances must be a gain to letters. The second volume of M. Faugère's edition of the unpublished works (6) contains two memoirs on the subjects which were nearest the author's heart—the legitimization of bastards, and the peculiar privileges and virtues of the *pairie*—with several "pièces diverses," including the sketch, written in the writer's most terrible style, of the Père Tellier. Let us hope that all the Saint-Simon waifs, whether published under M. Faugère's auspices or under those of anybody else, will one day or other find a home in the admirable edition of the memoirs which M. de Boislisle has just began in the *Grands écrivains de la France*.

Two more volumes of M. Thiers's speeches (7) carry on the publication to the year 1864 That there is between Article clxx. (November 1851) and Article clxxi. (December 1863) a gap of twelve years is perhaps a fact not unworthy of mention as a striking illustration of history.

The second and last volume (8) of the supplement to M. Fétis's well-known dictionary of music and musicians has appeared.

M. Félix Pécaut (9) has compiled a volume which gives pro-

(2) *Les mystères.* Par L. Petit de Julleville. 2 tomes. Paris: L. Hachette & Co.

(9) *Deux mois de mission en Italie.* Par Félix Pécaut. Paris: L. Hachette & Co.

bably the most complete account in existence of the system of public instruction (especially of girls) actually existing in Italy. It is unfortunately necessary to say that it is very far from an amusing volume, the author being apparently eaten up by the twin zeal of mechanical educationalism and Republican politics. But the facts seem to be honestly stated, and the book, as a book of reference for persons interested in the subject, is by no means devoid of merit. Every fresh example, however, of the obsolescence in France of a certain maxim about the *genre ennuyeux* (we might go further and say the *genre bête*) is of evil augury.

Eighteen years ago, it would appear, M. Jules Barni delivered a course of lectures in Geneva on "the Victims of Free-thought," a course which certainly, considering Servetus and Rousseau, might have been delivered in a less appropriate place. M. Barni, who was probably at that time an exile, is now a French Deputy, and his lectures have been reprinted (10). They deal (besides the personages just mentioned) with some interesting figures, such as Abelard, Bruno, Campanella, Vanini, &c., but the handling, though honest and painstaking, cannot be said to be particularly adroit.

All persons who are not weary of Dantean commentary may read M. Julian Klaczko's work (11) on this and other things without fear of being inordinately bored. He has taken the form of dialogue for his work, but his characters preach in a manner which Socrates would have found scarcely tolerable.

"Un Diplomate" (12) has paid England the compliment of borrowing from her his term for a καλοκἀγαθός, and has illustrated his conception thereof at considerable length. The oddest part of the book is a list of personages who, to the author's mind, bear the name of gentleman worthily. Most of them, we confess, are persons of whom we have not previously heard, the reason of which is perhaps that the majority seem to be of Portuguese nationality. Perhaps this also accounts for the fact that the only Englishman enrolled in this list *clarorum virorum* is the present Lord Lytton, whom the author, supposing his observations of "the gentleman" to have been conducted on the banks of the Tagus, may naturally have had most opportunities of studying.

M. Léopold Lacour has put much sound sense and good criticism into his book (13) on the three chief dramatists (MM. Augier, Dumas fils, and Sardou) of the veteran battalion now living in France; and he promises us a supplement on MM. Gondinet, Labiche, Barrière, &c., to which we look forward with pleasure. The chief and principal thing is that M. Lacour has declared war to the knife against M. Zola. In this question lie the issues of life or death for French literature nowadays, and any vigorous recruit on the right side is to be welcomed.

M. Lemerre's *Petite bibliothèque littéraire* has received two accessions—the fourteenth volume (containing *Macbeth* and *Othello*) of François Victor Hugo's translation of Shakspeare (14), and the first volume (15) of an edition of Paul de Musset's sketches of the literary oddities of the seventeenth century.

The *Histoire de Bayart* (16), which Messrs. Hachette published not long ago in their *Bibliothèque des Ecoles et des familles*, has been republished with an English introduction and notes by M. Jules Bué.

The most remarkable thing in the fifth number of the *Revue des arts décoratifs* (17) is the representation (on what scale we are not told) of a cup and cover of the sixteenth century in goldsmith's work. The proportions are admirable, and the ornaments, chiefly in winged monsters of a dragonish kind, are excellently disposed.

The usual deluge of almanacs (18) has set in at Paris. The *Almanach de la bonne cuisine* will teach any misguided person who believes in it to ruin a salmon by stewing him in champagne. The veritable *Triple Liégeois* will give all sorts of learned information to whosoever can decipher its very blunt type on its very grey paper. The *Almanach-album des célébrités* explains itself. Three different publications bear the name, honoured by almanac-buyers, of Mathieu de la Drôme, and as they are of different prices and all come from the same publishers, no uncomfortable suspicion of piracy need be entertained. The *Almanach parisien* has a pleasing absence of special features. On the contrary, the *Almanach des Parisiennes* preserves some of the least edifying fancies which have inspired M. Grévin's ingenious but vagabond pencil. The *Almanach comique* really has some title to its title, though it makes an Englishman think somewhat fully of the "Comic Almanack" of the days of his youth. Good Catholics, "scientists," young mothers, dolls, feminine persons anxious for fashions not more than a year old—all have their Year-books. There is the *Almanach de France et du musée des familles*—an odd conjunction; the little national *Almanach de France*, with a ferocious Turco on the cover; the *Almanach astrologique*; the *Almanach prophétique* (which is not so amusing as the pantagrueline prognostications); and the Lunatic Almanac. The *Charivari* has its book, and indeed several; for more than one of those already mentioned draw their illustrations from that periodical. The *Almanach pour rire* may be applied to the midriffs which the *Almanach comique* has failed to move. Finally, *Le parfait Vigneron* laments the policy of a short-sighted Government, which objects to the perfect wine-grower supplementing his stock of Lafitte with raisin-wine; the *Almanach du savoir vivre* reproduces, though perhaps in a less bungling manner, the minute directions of our own well-known manuals of etiquette; and the "Illustrated Thief" gives, like the *Almanach des célébrités*, plentiful portraits of persons whose life or death has been notable in the past twelvemonth.

The novels on which we have to comment are all of fair average merit, or perhaps a little more, but offer nothing very remarkable. Three anonymous *Histoires intimes* (19) are carefully written, with a certain dash of the preposterous; as, for instance, in the first, where a widow courted by a younger man long refuses his suit for fear of becoming an object "which he can only love out of pity," but consents on learning that she has incurable heart complaint. M. Eugène Chavette (20) opens a novel with a mystery which would have made Mr. Wilkie Collins's mouth water fifteen years ago. M. Ulbach's known wealth is such that he does not incur the suspicion of poverty by adapting (21) a novel from the famous Hungarian romancer. *Le tapis vert* is of the class to which we should expect it to belong—a novel of incident, the scene being, not Hungary, but Poland and Russia. M. Henri Rochefort seems to be taking vigorously to his new function of novel-writing. *Le palefrenier* (22) is, we think, his most successful effort as yet of the kind. In it an enthusiastic Communist converts and marries the daughter of his Legitimist employer, and she goes out to join him in New Caledonia. That not wholly delightful region seems to have produced upon M. Rochefort's spirits the effect untranslatably denominated in French "obsession." He cannot keep it out of his memorials. Lastly has to be noticed a kind of dramatic romance which M. Ferdinand Fabre has written, not, as it seems to us, without some inspiration from M. Alphonse Daudet. *L'hospitalière* (23) is a sufficiently touching story of Cevenol peasant life. It is preceded, however, by a would-be playful account of the history of its composition, and of the debates between M. Fabre's "Moi de Paris" and "Moi d'Yport," at which latter place *L'hospitalière*, we are to suppose, first saw the light. This seems to presuppose a greater interest on the part of readers in the processes of the author's mind than they (to judge from ourselves) invariably feel.

(10) *Les martyrs de la libre pensée.* Par Jules Barni. Paris: Germer-Baillière.

(11) *Causeries florentines.* Par Julian Klaczko. Paris: Plon.

(12) *Le gentleman.* Par un Diplomate. Paris: Plon.

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,306, NOVEMBER 6, 1880:

CONTENTS OF No. 1305, OCTOBER 30, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "The BRAZEN SERPENT," each 33 by 22 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. 1s.

ARTHUR TOOTH & SON'S ANNUAL WINTER EXHIBITION of HIGH-CLASS PICTURES, by BRITISH and FOREIGN ARTISTS, is NOW OPEN, at 5 Haymarket, opposite Her Majesty's Theatre. Admission, 1s., including Catalogue.

ROYAL HISTORICAL SOCIETY.—Lecture Theatre, South Kensington Museum. This Afternoon, at Three, Dr. ZERFFI will Lecture "On the Science of General History." Syllabus: Avatars and Incarnations—Gatama—Buddhism—Rock-hewn Temples—Indian Philosophy. Students of the Science and Art Department and Teachers of Board Schools admitted free. The Public 1s. 6d. per Lecture.

POSITIVISM.—LECTURES will be resumed during the Winter, at the Cavendish Rooms, Mortimer Street, Langham Place, W., on Sunday Evenings. The First Lecture will be given by Dr. BRIDGES, on Sunday Evening, November 7, at Eight o'clock P.M. precisely. Admission Free.

QUEEN'S COLLEGES, IRELAND.—The PROFESSORSHIP of LATIN in the Queen's College, Galway, being now Vacant, Candidates for that Office are requested to forward their Testimonials to the UNDER-SECRETARY, Dublin Castle, on or before November 13, 1880, in order that the same may be submitted to his Excellency the Lord-Lieutenant.

The Candidate who may be selected for the above Professorship will have to enter upon his duties forthwith.

Dublin Castle, October 28, 1880.

THE GUILDHALL SCHOOL of MUSIC, under the conduct and control of the Corporation of London.

Principal Mr. H. WEIST HILL, assisted by eminent London Professors.

The HALF-TERM for Pupils taking more than one lesson a week will commence on Monday, November 8, 1880.

EXAMINATIONS of CANDIDATES for ADMISSION as STUDENTS will take place on Saturday, November 6, from Twelve till Four, when Candidates must attend, bringing with them music that they can perform.

Further particulars may be obtained from Mr. CHARLES SMITH, Secretary, at the School, 16 Aldermanbury.

FRED. A. CATTY, *Hon. Secretary.*
Guildhall, October 1880. CHARLES SMITH, *Secretary.*

TWYFORD SCHOOL.—Two EXHIBITIONS of £30 each will be offered for competition in January next. Arrangements are being made for BOYS whose Parents wish them prepared for the Navy or for the Modern Side of the Public Schools. For particulars, apply to Rev. L. WICKHAM, Twyford, Winchester.

RADLEY COLLEGE.

An Election will be held on December 10 to FOUR ENTRANCE SCHOLARSHIPS (Value £50, £50, £30, £20), open to Boys who will be under Fourteen on January 1, 1881.

During the Examination, which begins on Wednesday, December 8, at 4.30 P.M., Candidates will be accommodated in the College.

For further particulars apply to the Rev. the WARDEN, St. Peter's College, Radley, Abingdon.

MALVERN COLLEGE.

The ANNUAL EXAMINATION for SCHOLARSHIPS and ENTRANCE EXHIBITIONS will be held on December 7 and 8.

BRUCE CASTLE, TOTTENHAM.

Head-Master—Rev. W. ALMACK, M.A.

The main features of this School are its extreme healthiness, convenient buildings, and extensive grounds (20 acres), its system of education (which provides for special as well as ordinary requirements), and the thorough domestic care and organization. Few schools have greater natural advantages.

STRATFORD-ON-AVON.—TRINITY COLLEGE SCHOOL. The Warden, RICHARD F. CURRY, M.A., is assisted by Seven Resident Graduate Masters. Special attention paid to Modern Languages. Classical and Modern Sides. Junior Department for Young Boys. Exhibition to the Universities. Large Playing Fields, Gymnasium, Fives Courts, &c. Terms, 50 and 60 Guineas. Apply to the WARDEN.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

ST. LEONARDS-ON-SEA.—The Rev. H. J. GRAHAM, M.A. Oxon., receives PUPILS to prepare for the Public Schools. Large house on high ground, Cricket Field adjoining the Sea, and use of Sea-water Swimming Bath and Gymnasium. Terms, for Boys under Twelve, 80 Guineas; above Twelve, 100 Guineas.—Address, the Mount Lodge, St. Leonards-on-Sea.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

WINTER in SOUTH of FRANCE.—A FRENCH DOCTOR (Wife English) would take charge of Two or Three GENTLEMEN'S CHILDREN. Large house and grounds, south aspect. Experienced Resident Governess. Inclusive terms. English references exchanged.—Address, Dr. L., care of Messrs. G. Street & Co., 30 Cornhill, E.C.

AN UNDERGRADUATE, now at Oxford, experienced in Teaching, and who can give high Testimonials, seeks a HOLIDAY TUTORSHIP next Christmas Vacation.—Apply to RECTOR, care of Mr. Bailey, Bookseller, Horse Market, Darlington.

ISLE of WIGHT PROPRIETARY COLLEGE, Limited.—A VACANCY having occurred in the office of HEAD-MASTER, applications for the appointment will be received from Graduates of Oxford or Cambridge, in Full Orders, on or before November 18 next.—All particulars may be obtained from T. R. OWEN, Esq., Secretary, The Cottage, Melville Street, Ryde.

TO BE LET, with immediate possession, 55 LOFTUS ROAD, Uxbridge Road, Shepherd's Bush, W., within a few minutes' walk of the Metropolitan and London and North-Western Stations. The House, which has just undergone complete repairs, contains Ten good Rooms, and is well arranged as to domestic offices; with good Garden at the rear overlooking fields.—Apply to Mr. J. BOARDER, Builder, 9 Pleasant Place, Uxbridge Road, W.

CONSOLS *versus* GROUND RENTS.—Consols pay 3 per Cent. Freehold Ground Rents, equally safe, pay 4 to 4½, and constantly increase in value. Descriptive Paper gratis, of Messrs. GEORGE BEKEN & Co., Ground Rent Agents, 86 London Wall.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

BENJN. BULL, *Manager.*

Egerton Hubbard, Esq.	Charles Baring Young, Esq.

FIRE ASSURANCES on liberal terms.

LIFE ASSURANCES with or without participation in Profits.

Loans are granted on security of Life Interests in connexion with Policies of Assurance.

A large participation in Profits, with the guarantee of the Invested Capital Stock, and exemption, under royal Charter, from the liabilities of Partnership.

All real improvements in modern practice, with the security of an Office whose resources have been tested by the experience of more than a Century and a Half.

The Corporation are open to consider applications for Agencies.

A Prospectus, Table of Bonus, and Balance Sheet will be forwarded on application.

E. R. HANDCOCK, *Secretary.*

SUN FIRE OFFICE.
THREADNEEDLE STREET, E.C. CHARING CROSS, S.W.
OXFORD STREET (Corner of Vere Street), W.
Established 1710. Home and Foreign Insurances Effected. Sum Insured in 1879..£262,492,461.
FRANCIS B. RELTON, *Secretary.*

PHŒNIX FIRE OFFICE.
LOMBARD STREET AND CHARING CROSS, LONDON.—ESTABLISHED 1782.
Prompt and liberal Loss Settlements.
Insurances effected in all parts of the World.
JOHN J. BROOMFIELD, *Secretary.*

IMPERIAL FIRE INSURANCE COMPANY.
Established 1803.—1 OLD BROAD STREET, E.C.; and 22 PALL MALL, S.W.
CAPITAL, £1,600,000. PAID-UP and INVESTED, £700,000.
E. COZENS SMITH, *General Manager.*

THE AGRA BANK, Limited.—Established in 1833.
CAPITAL £1,000,000. RESERVE FUND, £175,000.
HEAD OFFICE: NICHOLAS LANE, LOMBARD STREET, LONDON.
BRANCHES in Edinburgh, Calcutta, Bombay, Madras, Kurrachee, Agra, Lahore, Shanghai, Hong Kong.

Current Accounts are kept at the Head Office on the Terms customary with London Bankers, and Interest allowed when the Credit Balance does not fall below £100.

Deposits received for fixed periods on terms to be ascertained on application.

Bills issued at the current exchange of the day on any of the Branches of the Bank, free of extra charge; and Approved Bills purchased or sent for collection.

Sales and Purchases effected in British and Foreign Securities, in East India Stock and Loans, and the safe custody of the same undertaken.

Interest drawn, and Army, Navy, and Civil Pay and Pensions realized.

Every other description of Banking Business and Money Agency, British and Indian, transacted.

J. THOMSON, *Chairman.*

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.

The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.
ACONCAGUA	4,107	600	JOHN ELDER	4,152	550
CHIMBORAZO	3,847	550	LIGURIA	4,666	750
COTOPAXI	4,028	600	LUSITANIA	3,825	550
CUZCO	3,845	550	ORIENT	5,386	1,000
GARONNE	3,876	550	POTOSI	4,219	600

The above Steamers have been specially fitted for carrying all classes of passengers through the Tropics on long voyages, and the passages hitherto made are the fastest on record.

For further particulars apply to the Managers of the Line, F. GREEN & CO., 13 Fenchurch Avenue, and ANDERSON, ANDERSON, & CO., 5 Fenchurch Avenue, London, E.C.

DENT'S WATCHES, CLOCKS, and CHRONOMETERS.
Illustrated Catalogue sent free.
Apply to 61 STRAND, or 34 ROYAL EXCHANGE, LONDON.

FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free.—248, 249, and 250 Tottenham Court Road, and 19, 20, and 21 Morwell Street, W.C. Established 1862.

DECORATION.

MORANT & CO., having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

91 NEW BOND STREET, W.

INVALID FURNITURE.—Wicker Bath Chairs, £2 2s.; Invalid Adjustable Couches and Beds, from £5 5s.; Exercising Chairs, with horse action, from £5 5s.; Carrying Chairs, £2 16s. 6d.; Reclining Boards, £1 5s.; Trapped Commodes, £1 5s.; Perambulators, £1 5s.; Leg Rests, £1 10s.; Back Rests, 12s. 6d.; Merlin Chairs, £6 10s.; Bed Tables, from 15s.; &c. Descriptive Catalogues post free.

J. CARTER, 6A New Cavendish Street, Great Portland Street, W.

BREAKFAST in BED.—CARTER'S PATENT REVOLVING BED TABLE, adjustable to any height or inclination for reading and writing. Price from £2 5s. Descriptive Catalogues post free.

J. CARTER, 6A New Cavendish Street, Great Portland Street, W.

FIRESIDE COMFORT.—CARTER'S LITERARY MACHINE.—For holding a Book or Writing Desk, Lamp, Meals, &c., in any position, over an Easy Chair, Bed, or Sofa, obviating the fatigue and inconvenience of incessant stooping while reading or writing. Invaluable to Invalids and Students. Admirably adapted for India. A most useful gift. Prices from 21s. Descriptive Catalogues post free.

J. CARTER, 6A New Cavendish Street, Great Portland Street, London, W.

NOTICE TO THE PUBLIC.

DOULTON WARE.—As inferior imitations of their celebrated ART STONE WARE are being introduced, Messrs. DOULTON beg to inform the public that their ART PRODUCTIONS invariably bear an impressed Stamp, with the name in full, "DOULTON, LAMBETH," with the year of manufacture.

No. 1,307, Vol. 50. November 13, 1880. [Registered for Transmission abroad.] Price 6d.

MR. GLADSTONE AT GUILDHALL.

MR. GLADSTONE is not necessarily to be blamed if his speech at Guildhall has disappointed public curiosity. One of the most useful accomplishments of a great orator is the faculty of saying little or nothing in sonorous language, when it might be inconvenient to exercise the higher gift of lucid disclosure. The expectant audience need not have thronged Guildhall to learn that there has been a good harvest in Ireland, that the social and political condition of the country is nevertheless unsatisfactory or alarming, that Governments ought, if possible, to maintain order by means of the ordinary law, and that they are nevertheless bound, if their first efforts fail, to discharge their primary duty at any cost. When the reign of anarchy will be thought by the present Ministers to have culminated so as to require interference was a secret not revealed by Mr. GLADSTONE. He was assuredly not bound to confide the policy of his Government to a miscellaneous crowd, although Lord Mayor's Day has sometimes been selected by his predecessors as a fit occasion for announcing important resolutions to the country. It was undoubtedly prudent to confine the account of transactions in Afghanistan to the statement of two or three notorious facts which the company and the waiters at the table knew as well as the PRIME MINISTER himself. Any declaration about Candahar would have been transmitted to India in an hour, and to Cabul and Herat in a few days. It is extremely undesirable that, if the Government has resolved on retreat within the old frontier, native friends and enemies should be encouraged to profit by a premature communication. It was rather decorous than instructive to state that the Government regarded the war in South Africa with anxiety. The colonists will perhaps soon be anxious to learn whether they are to expect the aid of the Imperial forces.

Mr. GLADSTONE's vindication of his mysterious and unexplained policy in the East was, if possible, still more obscure than his language about Ireland, and it was in some respects highly characteristic. It had not been suspected that the main object of the present Ministers has been to complete in the same spirit the task which had been commenced by their predecessors. Two years ago Lord BEACONSFIELD had on a similar occasion expressed his confidence that the due execution of the Treaty of Berlin would both conduce to the welfare of the populations which it concerned and secure the peace of Europe. Mr. GLADSTONE does not blame Lord BEACONSFIELD for having been somewhat too sanguine, and he has indicated his cordial concurrence in the eulogy on the Treaty of Berlin by doing his utmost to enforce its provisions. The instrument which he has chosen for the purpose is the concert of the European Powers, for Mr. GLADSTONE is not inclined to assume on behalf of England the responsibility of separate action. He acknowledges the difficulty of reconciling independent or divergent interests; but he holds, with good reason, that the common action of the Powers is irresistible if only it can be ensured. Mr. GLADSTONE has a perfect right to claim for his Government the provisional success of having induced all the Great Powers to join in the naval demonstration to which they are still parties. He afterwards quoted, rather with contemptuous incredulity than with satisfaction, an official statement made on the highest authority that Dulcigno will be handed over to Montenegro in two or three days. There is a curious contrast between present practice and comparatively recent tradition in the transmission by the SULTAN himself of a telegraphic message to the English Government, with a request that its substance should be announced at the LORD MAYOR's dinner. In former times the Grand Turk would scarcely have condescended to know that there was such a dignitary as the Lord Mayor. If the mixture of Asiatic and municipal associations is startling, the manner in which Mr. GLADSTONE discharged the SULTAN's commission may well astonish Asiatics, to whom the forms of courtesy have almost a religious value. Having received a flattering request from a potentate who is still the hereditary chief of a widespread religion and the ruler of a vast Empire, Mr. GLADSTONE thought it becoming to treat the message as a joke. Though there was nothing ludicrous in the announcement that a tedious diplomatic difficulty was at last removed, Mr. GLADSTONE contrived, by manner or intonation, to cause, according to the reporters, "laughter," "great laughter," and "continued laughter." The stern reprover of levity, the orator who scorns a jest, could not refrain from offering an affront to a Mussulman potentate who had gone out of his way to be complimentary and courteous. The sneer which provoked the ready laughter of an idle audience probably illustrates more accurately than any language which was used Mr. GLADSTONE's disposition towards Turkey. It is true that he disclaimed ill will to the SULTAN's subjects, but in diplomatic transactions a nation is represented by its sovereign. Of the Greeks, and of European concert as applied to the satisfaction of their claims, Mr. GLADSTONE abstained from saying a single word.

If Mr. GLADSTONE's statements on Ireland are carefully examined, the choice of phrases and the selection of topics will perhaps be found more instructive than the ostensible text of his discourse. He could not be expected, when he acknowledged that Providence had vouchsafed to Ireland an abundant harvest, to admit that the same agency had conclusively set aside the only possible excuse for the anomalous Disturbance Bill. The measure was defended only on the ground that extraordinary means were needed to relieve a distress which has since disappeared. As Mr. PARNELL said the other day, last year the tenants could not pay their rent because the harvest was bad; and this year the harvest was much too good for its proceeds to be handed over to the landlords. Not having anticipated Mr. PARNELL's antithetic counsels, Mr. GLADSTONE owns that he is disappointed. While he scarcely ventures to apply to the subversive and virulent agitators the mildest terms of censure, he attributes the prevailing discontent to the vicious legislation of former times. More recently, at his own suggestion, Parliament has been wiser and more generous, inasmuch as it has passed the Land Act of 1870; and he finds that there prevails an impression, "by no means confined to agitators or like-minded "people," that the principle of the Land Act requires further development. With a boldness which might be called by a harsher name, he asserts that the Land Act conferred a benefit on the occupiers "without inflicting "injury on any other class whatever." If he had denied that the Act caused injustice, he would merely have defended it as sound in principle; but it is incredible that he should dispute the injury to the landlords of a transfer to the occupiers of a portion of

their property, amounting at the lowest estimate to many millions. If liability to compensation for disturbance was not a loss to one party, it was not a gain to the other. It may be added that, in the contemplated Land Act, the owners may be more heavily mulcted without suffering, in Mr. GLADSTONE's judgment, any injury whatever. The significant threat to the owners is followed by a reference to the Land League which almost amounts to an apology for their proceedings. "Objects, some of them perhaps legitimate, others more "questionable," have been pursued, "in our view by means "that cannot for a moment pretend to the title of being "legitimate, and that are totally incompatible with the first 'conditions of a well-constituted society." In the view of the Government, which may be mistaken, and which is subject to correction, murder, assault, threatening letters, mutilation of cattle are incompatible with the conditions of a well-constituted society; but as to the objects which are proposed by Mr. PARNELL, Mr. DILLON, and Mr. HEALY, they are at least partially legitimate. It is perhaps not legitimate to threaten with death any person who in the province of Connaught speaks disrespectfully of the Fenians; but Mr. GLADSTONE seems to regard with tolerance the main purpose of the Land League, which is openly avowed to be the abolition of property in land, except when it is vested in the occupier, or, as it is called, of landlordism. Of the cruelty and the tyranny which prevails, Mr. GLADSTONE speaks with less hesitating disapproval. As he observes, it is Ireland which suffers, and not England; and not the landlords only, whose sufferings might apparently excite less sympathy, but occupiers and would-be occupiers are exposed to persecution. The Government confesses that it is bound to protect the victims of agrarian violence; and "circumstances might compel us "to ask for increased powers, although we will never anticipate such a contingency, nor imagine it to exist until "it has been proved by the clearest demonstration." The contingency has existed for several months, and it has been proved by the clearest demonstration. Mr. GLADSTONE's undertaking to protect life and property in some imaginary state of affairs much worse than the present amounts to a distinct and formal refusal to prevent seditious meetings, to interfere with the acquisition of deadly weapons, to discourage assassination, or to secure the rights either of landlords or peaceable tenants. Such is the answer which the PRIME MINISTER gave to the urgent and unanimous demand of all loyal and peaceable Irishmen. It would seem that Mr. CHAMBERLAIN had sufficient authority for making the statement that the Government would in no circumstances exceed the powers of the ordinary law. It remains to be seen whether their apathetic attitude will be changed by the recent events in Mayo.

RUSSIA.

THE Russian Government has apparently succeeded in discovering and arresting the principal agents in the Nihilist plots. Sixteen persons, of whom three are women, are on their trial before a court-martial, composed partly of permanent officials and partly of the commanding officers of different regiments of the Guards. The crimes with which the accused are charged are the murder of Prince KRAPOTKINE, attending a revolutionary Conference in the summer of last year, furnishing the funds for or working secret printing-presses, and, above all, the three attempts to assassinate the CZAR. There was first an attempt to assassinate the CZAR on the Simpheropol line in November 1879. The line was mined with dynamite, but the mine did not explode, as the wire attached to it was accidentally cut. It was only many months later, when the line was most carefully examined on the eve of a new visit of the CZAR to Livadia, that the preparations made in the preceding November were discovered. Two of the accused now acknowledge that they were concerned in laying the mine on this occasion. Then there was the attempt to blow up the CZAR in the Moscow explosion in the December of last year. The history of this attempt was revealed to the police by a Jew named GOLDENBURG, who committed suicide after revealing the names and stories of his accomplices, and who stated that he had worked at the Moscow mine with other persons, of whom one was HARTMANN, who, after having given no little trouble to the French Government, is now doing us the honour of residing in London. Lastly, there was the attempt to blow up the Winter Palace in the February of this year. The police have now caught and put on his trial the carpenter who lodged in the basement under the dining-room, and they have further traced the man who supplied the dynamite used. This prisoner, like others who are accused of the graver offences, makes no defence, and no secret of what he has done; and states that he "prepared all the dynamite for various explosions," two hundredweight in all. The murderer of Prince KRAPOTKINE had already confessed his crime, being the Jew who hanged himself after his revelations. Thus the guilt of all the most startling of the Nihilists' crimes has been traced home to persons who have acknowledged their guilt. This is so far satisfactory. It would have been a sad encouragement to atrocity if any of these daring crimes had been perpetrated without their authors having been discovered. It is too much to suppose that all those who were guilty have been brought to trial; but there is good reason to suppose that the various attempts on the life of the CZAR were contrived and executed by a very small band. One of the prisoners, for example, revealed that in November of last year he had prepared a mine on the Odessa line, over which it was supposed the CZAR would pass. When it was found that the CZAR had gone by another route, the prisoner took up his dynamite, and took it to Moscow, in order to assist in the proposed December explosion. The agents, therefore, working in very different parts of Russia, were really the same men, and one man made the dynamite for the whole gang. The brigands all belonged to one band; the band has been captured—or, at least, its leaders have been captured; and it may therefore be hoped that the danger of Nihilist assassinations is for the present at an end.

But, if we ask what is the state of Russia generally, and examine the symptoms of political disaffection, it is evident that either the most enormous injustice has been done to innocent men, or there must have been quite recently a fever of discontent on the part of persons who hated the Government, although they had no connexion with villanous attempts to commit murder. The stream of exiles to Siberia, either overland or sent by sea to Archangel, has never stopped, and is still flowing on. Figures on a point as to which all possible secresy is preserved must not be implicitly trusted; but when the number of exiles to Siberia this year is given at twelve thousand, it may be assumed that at any rate the real number is very large, and there can be no doubt that a very large proportion of these exiles belong to the educated classes. Since Count MELIKOFF has assumed the office of Minister of the Interior, some attempt has been made to allay political discontent by making some concessions and promising more. But he has clearly given it to be understood that, whatever changes are to be made, they are to be not in the character of the Russian Government, but only in the manner of its working. During the present reign no dream of a Constitution is to be thought of. A little more liberty of action is to be given to local institutions, and the press was taught to hope that it would be permitted to speak a little more freely. But no sooner was this hope held out than Count MELIKOFF summoned the leading editors to his presence, and warned them that, above all things, they must guard against illusions. They must, in short, take care that they wrote nothing with which the Government could be displeased. They soon had an illustration of what was meant. A new journal, conducted by one of the best known of Russian writers, was allowed to be started; but within a few days its sale in the streets was prohibited, because it had hinted at a variance of opinion in the Council of the Ministry. There is, however, observable something of a greater freedom in the tone of Russian journalism. The *Golos*, for example, has lately on one occasion pleaded for the restoration to their homes of some Circassians who were expatriated in 1878, and on another occasion has pleaded for the extension of a moderate amount of toleration to the sect of Old Believers. But the greatest present difficulty of Russia is not so much political as financial. The distress in large districts is terrible. In many of these districts it is calculated that there is only one-third of the ordinary crop of rye. All kinds of produce have fallen short, and the Russians, to their astonishment, find themselves importing articles which they have been accustomed to consider as grown for export, such as grain, tallow, and wool. The failure of the crops is attributed not so much to weather or the

soil as to an invasion of beetles, worms, and locusts, and it may be hoped that, as such an invasion was a novelty, it may not recur. But there can be no doubt that the Russian peasant is going through a very bad time, even if there is some exaggeration in the statement that he is keeping himself alive by eating up his capital and by selling his last stack of wood, his cattle, the straw off his roof, and even the clothes off his back.

Russia and England have one point of close resemblance. They are both great European Powers, expected to take their part in all large European questions; but, from the enormous area over which their dominion extends, they are always having minor affairs of their own to engross a large portion of their attention. We have just now troubles in Afghanistan, troubles in South Africa, troubles in Ireland. The Russians, for their part, have to concern themselves with China, with the Tekke Turkomans, and with the everlasting sore of Poland. It is Austria that now makes Russia more than usually anxious about Poland. The Poles of Galicia are now getting on such good terms with the Austrian Crown, and have lately been so charmed with the attentions of the EMPEROR, that Russia is alarmed lest Russian Poland should gravitate towards Austria if it gets a chance. The symptom of this alarm is the old familiar symptom of an attempt at renewing relations with the Vatican. Whenever Russia is frightened, it makes overtures to the spiritual head of the Poles, and it terminates negotiations as soon as it recovers its peace of mind. The Turkoman expedition is this time a very serious affair. The lesson of the failure of last year has been taken to heart, and this time everything is being done to ensure success. The country now held by the Turkomans is to be approached by a railway continued by a tramway, and several miles have already been laid from the south-eastern angle of the Caspian. The most famous, or at least the most active, of Russian commanders, General SKOBELEFF, commands, and the preparations are said to be so extensive that the General is provided with a hundred pieces of artillery. Whether there will be a Chinese war within a few months depends on the Chinese. The Russian papers are alternately instructed to alarm and to comfort their readers. One day the public is informed that the Chinese are hurriedly pressing Kalmucks into their military service, and the next day it learns that the Chinese frontier is only held by invalid Mongols armed with bows and arrows. What seems certain is that Russia will get all she wants out of China or will fight. A force has been collected which it is thought will enable the Russians to sweep the Chinese off the sea, to close the ports, and pounce on the capital. They insisted that before any negotiations were so much as begun the Chinese Government must release the Ambassador who was lying in prison for having signed a treaty with the CZAR last year. This has been done, and the door to negotiations is still open. If the Chinese like to pass through it, they can; but at present they seem unable to make up their minds, and, so far as they indicate any leaning, seem inclined to run a great risk rather than undergo what they conceive to be a great humiliation.

THE INVASION OF MAYO.

WE do not know when Englishmen have had more cause to be ashamed of the government of their country than they have had during the past week. Every morning the columns of the London newspapers have been full of rumours and of facts respecting a transaction the occurrence or the very idea of which might be thought impossible in a civilized country. Within half a day's journey of London it has been found necessary to substitute for the organized forces of authority the organized forces of a Vigilance Committee, in order to ensure the exercise of the plainest legal rights. But for this Vigilance Committee, a man against whom no crime of any kind can be charged, and whose only fault, even in the eyes of his enemies, is that he has been faithful to his employer and has endeavoured to enforce that employer's just claims, would be practically starved out of his own house, and the crops growing on his land would rot and waste for want of gathering. But private effort has stepped in, and there is at least a chance of Captain BOYCOTT being allowed to enjoy his own. The details of this private effort are those of a pioneer expedition into an uncultivated wilderness infested by savage tribes. The labourers who are to save Captain BOYCOTT's crops are girt with revolvers, and they carry with them provisions, appliances for shelter and warmth, and all the necessaries of the explorer who is at the same time a soldier. That these precautions are not uncalled for is testified in the amplest fashion by the measures simultaneously taken by what is called by courtesy the Government. Regiments of foot and squadrons of horse, and numerous bodies of Constabulary, have been drafted from all parts of Ireland, in order to "protect" the BOYCOTT expedition. That expedition, indeed, is rather distasteful to the party which the Government more especially heads. A "wrong-headed scheme," they call it; it being apparently the only right-headed proceeding to leave honest men to be hounded out of the country by rogues, and to allow the fruits of the earth, which are supposed to be all too scanty in Ireland already, to be ruined out of sheer spite to their lawful owner.

The foot and the horse, and the constables who throng the streets and barracks of Claremorris and Ballinrobe, seem to have conveyed to the minds of some persons a comfortable feeling as to the energy of the Ministry. How, indeed, can energy be shown in a more tangible form than in that of sabres and bayonets? But it seems to be forgotten that every soldier who wears the QUEEN's uniform in Mayo at this moment, as well as every good man and true who has put his life in his hand and gone down to Lough Mask to save Captain BOYCOTT's property, is a reproach to the Government, whose supineness and irresolution—it may almost be said, whose culpable dallying—with the offenders have made the presence of both necessary. That such a thing as this BOYCOTT expedition should be unavoidable, that the very notion of its being in any possibility required should be able to enter the head of a sane person, is evidence that the Government of the country has disgracefully blundered, if it has not done worse. For it must be remembered that, by the testimony of impartial observers, and, more than that, of observers whose inclinations are rather on the Land League side, the terrorism which has all but debarred Captain BOYCOTT from fire and water is terrorism, and nothing else. The labourers and the artisans, the tradesmen and the car-drivers who will now have nothing to do with him, have not the least personal grudge, or at least had not a short time ago. Their refusal to serve and supply him is simply an obedience to the orders of secret conspirators; that is to say, a silent acknowledgment that the Government is believed to be unwilling or unable to give law-abiding citizens the benefit of the law. Can any one say that this is unreasonable on their part? On the contrary, much more acute and wary persons than these Connaught peasants and shopkeepers might have been led by the policy of Mr. GLADSTONE to believe that no serious interference with the proceedings of the Land League was contemplated. The obstinate refusal of the Government to resort to the one single method of preserving or restoring order which has ever been found effectual in Ireland, the equally obstinate repetition of vague promises that something, no matter how much, should be conceded to the agitators' demand, the wild statements about each eviction being a sentence of death, the pictures held up to England and Europe of the cruelty and tyranny of the landlords—how could all these things fail of their effect? The very last step taken, salutary, and indeed necessary, in itself, wears an aspect not wholly dissimilar to these things, or at least is capable of being made to wear that aspect by artful agitators. As long as the victims of the Land League persecutions, the Captain BOYCOTTS and the Miss GARDINERS, were helpless, the Government looked on at their persecution with critical indifference. As soon as help arrives, armies pour into Mayo, to see that the helpers are protected perhaps, but also to see that they do not in any way provoke or molest the persecutors. Besides, did not Mr. GLADSTONE himself speak about civil war? Is it surprising that his words, like all such words, should tend to make themselves come true?

When Mr. GLADSTONE spoke at Guildhall on Tuesday, the facts of the BOYCOTT expedition, its necessity, its probable consequences, were all before him. He knew better than any one of his hearers could know that at the moment he spoke the same means were being taken in a province of the QUEEN's dominions, and within a few hundred miles of the capital, which might have been taken by the "Argonauts" of California to rescue comrades suddenly beset by Indian savages. Probably it was

this knowledge that stimulated him to draw cheers from his audience by the liberal promise to enforce the law as it stood. He would not even anticipate the contingency of any extraordinary measures. Anticipate the contingency! The insufficiency of the law as it stands is a "contingency" not to be "anticipated," when a company of armed volunteers have to journey from one part of the kingdom of Ireland to another in order to secure for a peaceable citizen the enjoyment of his own, and when soldiers and armed constables by the hundred and the thousand have to be drawn together in order to protect the armed volunteers. There are the plain and disgraceful facts, the writing on the wall pointing out either the insufficiency of the "law as it stands" or the hopeless incapacity of those by whom that law has been administered. But Mr. GLADSTONE dismisses it all as a contingency which he refuses even to anticipate. What may be the upshot of the business nobody can tell. The Cavan and Monaghan yeomen, supporting themselves on imported provisions—for the law as it stands does not put them in the position to buy food in Mayo—protecting themselves either by their own revolvers or by the aid of a few battalions of infantry and troops of cavalry—usual and everyday enforcers of the law as it stands—may do their work without interference or they may not. Captain BOYCOTT may be saved for the time from ruin or serious loss, and perhaps if the garrison of infantry and cavalry is permanently kept up, he may "see the flowers in spring" which his poetical persecutors have declared that he shall not see. It is possible that what is now being done in Mayo may have to be done again. The North of Ireland is full of stout labourers and wealthy public-spirited men. The brigade, or flying column, or whatever it is, can be moved to Clare or Kerry, or where not, and this remarkable fashion of demonstrating the sufficiency of the law as it stands may be, by the longsufferance of the people of England, continued indefinitely. But not the less will the invasion of Mayo remain as a blot on the scutcheon of the Ministry which made it necessary, if not on that of the country which tolerated the scandalous failure of its governors in the first duty of governing.

THE FRENCH MINISTRY.

THE Ministerial crisis which has just begun, continued, and ended in France, differs in several particulars from those that have gone before it. M. FERRY is the meekest Minister that has yet been seen, even in that country of meek Ministers. He has allowed the Chamber to dictate to him the order in which he will do his own business, and virtually the length to which he will carry his own policy. His position at present is pretty much what Mr. GLADSTONE'S would be if, in February next, the House of Commons refused to let him introduce an Irish Land Bill, on the ground that the law must first be vindicated, and insisted on his at once bringing forward a County Franchise Bill. In England this would be considered as decisive and unmistakable a defeat as it is possible to inflict on a Ministry. In France and in M. FERRY'S revised vocabulary, it would be called a misunderstanding.

When the Chambers met on Tuesday, M. FERRY read a statement of his policy. He gave no explanation of the circumstances attending M. DE FREYCINET'S resignation, but simply said that the change of Ministry had not modified the general direction of public affairs; that the mandate of the Chambers had been carried out, and that Ministers had not "deemed it possible to suspend the "exercise of the laws on account of the difficulties and "resistance excited by their application, nor held it neces- "sary to ask of Parliament a change in legislation." Up to this point M. FERRY presented himself as the thorough-going Minister in contrast to M. DE FREYCINET, who had been afraid of dealing decisively with the religious orders, and had tried to settle the question by a side-wind. It very soon appeared that the difference between the two Ministers was only one of degree. M. FERRY had had the courage to disperse the male communities; he had not the courage to disperse the female communities. Their position, he said, will be settled by another method. I am going to introduce an elementary Education Bill, and when this is passed the nuns will be no longer mischievous. While listening to this it must have been impossible not to be reminded of what M. DE FREYCINET had said about the orders generally. Their position also was to be settled by another method than that of dispersion. He was going to introduce a Bill regulating the right of association, which would incidentally determine the status of religious communities. Upon this question the Extreme Left are perfectly consistent. They make no distinction between male orders and female orders. A nun is just as hateful to them as a monk, and should be got rid of by the same summary procedure. They saw no difference between M. DE FREYCINET'S proposal to deal with all the unrecognized orders by legislating on a subject not exclusively relating to them, and M. FERRY'S proposal to deal with some of the unrecognized orders by legislating on a subject not exclusively relating to them, and as they would have voted against M. DE FREYCINET if he had given them the chance, they at once made ready to vote against M. FERRY. Two opportunities of doing so at once presented themselves. The Cabinet did not wish a motion ordering an inquiry into the conduct of General CISSEY while Minister at War to be declared urgent; the Left declared it urgent. The Cabinet proposed to take the Elementary Education Bill before the Bill for re-organizing the magistracy; the Left decided to take the Magistracy Bill first. They were supported in both cases by the Right, which cherishes an impartial dislike to all Cabinets, and is ready to make part of every Opposition, and, thus reinforced, they were able in both divisions to put the Government in a minority. The last defeat was too much even for M. FERRY'S patience—or as the event has shown, he required forty-eight hours to get up the amount of patience needed—and he and his colleagues resigned.

M. GAMBETTA was at first accused of having had a hand in the overthrow of M. FERRY, as he had in the overthrow of M. DE FREYCINET, M. WADDINGTON, and M. DUFAURE. For once, however, the charge was without foundation. M. FERRY'S defeat was simply an indication that the Chamber is passing beyond M. GAMBETTA'S control. The party which had the principal share in the division of Tuesday regards M. CLÉMENCEAU as its leader, and between M. CLÉMENCEAU and M. GAMBETTA there is open and bitter enmity. But the time has not come, even in the present Chamber, when M. CLÉMENCEAU can get the better of M. GAMBETTA when the nature of the issue is clearly understood. When, on Thursday, it appeared that M. FERRY had withdrawn his resignation at the instance of M. GRÉVY, it was divined that he had really withdrawn it at the instance of a greater than M. GRÉVY. It is one thing to vote against what are suspected to be M. GAMBETTA'S wishes and another thing to vote against what are known to be M. GAMBETTA'S wishes. If the Correspondent of the *Times* is right in saying that M. GRÉVY had announced his determination to send for M. GAMBETTA if M. FERRY persisted in his resignation, it was plainly time for M. GAMBETTA'S friends to do something to prevent such a conclusion to the play. Hitherto M. GAMBETTA has had a perfectly good answer to all accusations founded on his alleged unwillingness to take office. How shall he form a Cabinet except he be sent for by the only man who, under the Constitution, has the right of appointing a Prime Minister? But, if M. GRÉVY had made up his mind to send for M. GAMBETTA, in the event of a certain contingency coming to pass, there was no alternative left except either to prevent that contingency coming to pass or to accept office if offered. It would, to all appearance, have been impossible for M. GAMBETTA to refuse to form a Ministry if M. GRÉVY had summoned him as being the only statesman who had the authority and the capacity necessary to construct a durable Cabinet. At least, he could only have refused at very great risk to his influence in the country. At the same time, there is more to be said than is always allowed for M. GAMBETTA'S dislike of taking office. He was perfectly right when he described the existing Chamber as having been elected to decide a particular issue, and this an issue which does not help or qualify the deputies to decide any other issue. The existing Chamber was elected to answer Marshal MACMAHON'S question whether they preferred the Republic to him or him to the Republic. That was the particular work which the constituencies had given it to do, and it did it excellently well. But it was not instructed to say how the constituencies wished the Republic to be governed, and consequently its preferences for one politician over another are, so far as the country is concerned, merely accidental. While this Chamber exists M. GAMBETTA does not think he can hold office to any good purpose.

M. FERRY'S part in the transaction just completed is

less intelligible. There are many things the doing of which is expedient though it is not expedient that this or that person should do them. It may have been very desirable that M. GAMBETTA should not be offered office at this moment; but it can never be desirable that a man holding the name at least, if not the power, of Prime Minister should humiliate himself as M. FERRY humiliated himself on Thursday. He condescended to ask the Chamber to reconsider its vote, on the extraordinary plea that France would lose weight in Europe from discredited and transient Cabinets. How a Cabinet could be more discredited than by being twice beaten on the first day of its meeting the Chamber, or what chance of permanence there could be for a Cabinet which had to begin by asking the forbearance of a hostile majority, he did not explain. The Chamber showed itself placable, and gave the Cabinet something purporting to be a vote of confidence. Even with this, however, M. FERRY's position hardly differs from that of a deer which is taken home after the hunt to be uncarted again at the next meet. But, though the deputies were willing to keep M. FERRY a little longer in office, they chose to give him an additional snub even in the act of retaining him. M. FERRY had said very humbly that the priority solicited for the Education Bill was not, in the opinion of the Cabinet, a question of principle, and that to refuse it that priority through distrust, however slight, was not justifiable. The Chamber thought otherwise. In its vote of confidence it made no mention of the order of business. That remains unchanged; so that to the end the Chamber has shown that distrust which M. FERRY deprecates. The Cabinet, according to its chief, tendered its resignation through pride, and withdrew it through patriotism. As to the presence or absence of the last motive M. FERRY must be the best judge; but there can be no question whatever as to the success with which Ministers have exercised pride. They are not likely to lose the faculty of taking beatings easily through want of practice. Now that the Education Bill has been postponed, it will be very difficult for them to assign any reason for not proceeding against the remaining orders which the Left will accept as valid. That they are nuns, and not monks, is a reason which has already been rejected by anticipation; but the work of dispersing nuns will be so unpleasant that M. FERRY will probably give and withdraw several other reasons for leaving them alone before he makes up his mind to the worst.

SIR BARTLE FRERE AND SOUTH AFRICA.

THE dinner to Sir BARTLE FRERE seems to have been more interesting than ordinary festivals of the same kind. When Sir RICHARD TEMPLE, who presided, described with courageous freedom of language an ideal administrator and patriot, the justification of his eulogy was that, in applying it to the guest of the evening, he descended into no anticlimax. In accordance with a judicious understanding, the politics of South Africa were not discussed either by the Chairman or by Sir BARTLE FRERE. With good taste, if the omission was intentional, Sir RICHARD TEMPLE abstained from including in the catalogue of Sir BARTLE FRERE's merits the statement that he had never made a mistake. He justly recognized the high quality of readiness to accept responsibility, as when Sir BARTLE FRERE, in the crisis of the Mutiny, denuded a recently conquered province of troops for the purpose of strengthening the army which Sir JOHN LAWRENCE was organizing for the reconquest of Delhi. LAWRENCE himself used to declare that he had never understood the meaning of responsibility, and that he often told his subordinates that, if they would do their best, he would himself be responsible for all things. It was his business also to discharge his duty to the best of his judgment without considering whether he was answerable for his decision to his superiors or to his country. The then Lieutenant-Governor of Scinde was of the same temper with the Chief Commissioner of the Punjab; and in later times, when employed in other regions, he has not become more timid or less confident in the soundness of his own judgment. In one important measure, though it proved in the end perfectly successful, the majority of English politicians hold that Sir BARTLE FRERE was in the wrong. That he was exclusively responsible for his policy he has never hesitated to admit; but, like CORIOLANUS, he regards his accusers and opponents as a defeated party. Probably he prefers the unanimous judgment of the South African colonists to the less instructed but more disinterested conclusions of English public opinion.

The moral courage of which even Sir BARTLE FRERE's enemies will not dispute his possession was not displayed by either of the Governments which he lately served. Sir M. H. BEACH addressed to him a strong official censure [illegible]ting instructions which were given in the form [illegible] when they ought to have been absolute and [illegible]. Sir BARTLE FRERE's previous despatches had indicated his intentions with sufficient clearness, especially if they were interpreted with the aid of some knowledge of his character. When he precipitated the rupture with the Zulu KING, he might fairly consider himself authorized to take a course which had not been distinctly forbidden. The present Government was equally feeble and undecided, though its principal members had in Opposition strongly condemned the South African policy. The Governor of the Cape was retained in office till a section of the supporters of the Ministry grew clamorous; and then he was dismissed on a trivial pretext, though any error which he had committed ought to have been considered as fully condoned. One of his chief merits has perhaps not been sufficiently appreciated by his official superiors. No Governor of recent times, except perhaps Lord DUFFERIN in Canada, has done so much to revive and stimulate the loyalty of an English colony. It was not merely because he crushed a formidable and possibly hostile Power that the people of South Africa overwhelmed their late Governor on his recall with expressions of admiration and regret. He shared with Lord DUFFERIN, whose character in other respects has no marked similarity with his own, the power of sympathising heartily with the community whose affairs he temporarily administered. In his speech at the late dinner Sir BARTLE FRERE paid felicitous and sincere compliments to the different races which occupy South Africa. The Dutch were the noble descendants of the men who fought against ALVA, springing, like ourselves, from the parentage of the ancient Northern races of Europe. Other colonists trace back their ancestry to the Huguenots who left France in search of freedom; and the nearer kinsmen, the English, Scotch, and Irish, remind Sir BARTLE FRERE of the society which was typified in Sir ROGER DE COVERLEY. The colonists, when they read the speech, after making due allowance for the language of effusive courtesy, will feel that Sir BARTLE FRERE regards their right to self-government as not less expedient than legally valid. If the occasion had admitted of political discussion, Sir BARTLE FRERE would probably have dilated on the proof which the Cape Colony is now affording of its independent energy.

The late Governor, whether or not he may have approved the policy of his Ministers, necessarily left to them the exclusive responsibility of the measure which caused the present war. Mr. SPRIGG, in his Parliamentary speeches, repeatedly claimed for himself and his colleagues the credit of the Bill for the disarmament of the Basutos. The object was probably expedient, if it could have been attained by pacific means, but the result has shown that the scheme was impolitic. The Basutos not long since did good service in wars with other native tribes; and although, as Mr. SPRIGG declared, they may have had no legitimate use for arms, they regarded the possession of arms as a mark of dignity; and they may also have foreseen the possible necessity of defending themselves against the attacks of neighbouring tribes. Their chiefs plausibly represented to their followers the demand for arms as part of a scheme for destroying or degrading a population which had hitherto been loyal. Unduly nervous anxiety to provide absolute security against attack created, as in many similar instances, the danger which had been in the first instance prematurely apprehended. It was in vain that Mr. SPRIGG personally remonstrated with the malcontent chiefs, and that he employed some of their special friends to remove their suspicions. The tribe generally took up arms, and the insurgents have since been joined by allies from neighbouring districts. As usual in such cases, the extent of disaffection is imperfectly ascertained; but it may be taken for granted that any considerable success against the Colonial Government would largely increase the number of its enemies. According to a report which has not been confirmed, a conspiracy of natives had caused great alarm in Natal, where twenty thousand Europeans are surrounded by twenty times their number of natives, mostly Zulus by origin. Beyond the frontier

of Natal is Zululand, now split up into separate districts under petty chiefs; but the soldiers of Cetewayo's army must by this time have retrieved their losses; and it is possible that they may wish to resume their former military preponderance. The Basutos also are formidable enemies, and, unlike the Zulus, they seem to rely largely on their firearms, and to have acquired respectable skill as marksmen. They also differ from most of their neighbours in being a nation of horsemen, with a consequent facility of rapid motion, though their active ponies are not adapted for the use of cavalry in the field. Like other parts of South Africa, Basutoland is full of natural strongholds; and the attack and defence of colonial or native camps forms the most important part of the operations of the war.

The brief accounts of the campaign which are published by the Colonial Government are probably accurate, as they are not unduly confident or exulting. The unfamiliar names of places convey few definite impressions to those who are ignorant of the topography of Basutoland. On two or three occasions General Clarke seems to have defeated considerable numbers of Basutos; but he or his officers have also incurred occasional reverses. The natives, with greatly superior numbers, can comparatively well afford a sacrifice of life. Until the superiority of European arms and discipline is conclusively established, the insurrection is not likely to abate. The most remarkable peculiarity of the present war is that it is thus far conducted by the colony alone without the aid of the Imperial army or of any regular force. Sir Bartle Frere was justified in saying that Mr. Sprigg's Cabinet is doing much to prove the right of the colony to manage its own affairs. In the contingency of disaster, the home Government must necessarily come to the aid of the colonists, and there is therefore no doubt as to the final event of the war; but it will be far more satisfactory that it should, if possible, be brought to a successful conclusion by the arms of the Cape Colony alone. One probable consequence of such an achievement would be the annexation to the colony of some of the outlying provinces. If the same process were eventually to extend over the whole of South Africa, a sufficient substitute would have been provided for the rejected scheme of federation. If the colonists defeat the Basutos they will have established an indisputable right to regulate their own relations with the conquered native tribes. It is perhaps for the purpose of attaining this object that the Colonial Government has hitherto declined to ask for Imperial aid. Their civil and military policy ought, at least for the present, to receive a friendly construction.

THE KURDISH INSURRECTION.

PHYSICS and politics have for some time past agreed to a mutual interchange of technical terms. What would be called in the former science a zone of disturbance has long existed in Central Asia, and the latest extension of this zone presents perhaps more curious features than any of its other sections. All along the winding line which, speaking generally, separates the frontier of Asiatic Russia from the States conterminous with it, there have of late been wars, or rumours of wars, from the furthest of all Far Easts, in Mantchouria, through the shadowy regions to the north of the great Chinese desert, and the scarcely better known districts where Ferghana borders upon Kashgaria, to Afghanistan and the Turcoman wastes which stretch northwards from Khorassan. The zone is now completed almost from sea to sea by the Kurdish insurrection which has set aflame the border districts of Persia and Turkey. As far as positive information goes, neither the knowledge which we possess of the motives of the outbreak, nor the knowledge which we possess of its progress, is particularly clear or trustworthy. The intelligence received partakes somewhat of the character of a game of chess or cricket. First one side has its move or innings, then the other. On one day we hear that the Shah's troops are cooped up, that they are unable to advance, that the chief frontier towns are captured. Then we are told that the insurgents have been defeated, that the towns never have been captured at all, and that the extent and scope of the insurrection have been grossly exaggerated. So it goes on; but, on the whole, there is certainly sufficient in the matter, if not exactly to cause disquietude, at any rate to attract attention. Without falling into the very [illegible] error of those who see in Sheik Obeidullah a [illegible], or into the almost equally probable error of those who see in him a mere frontier bandit, it may be possible to give a picture of the matter which, though necessarily conjectural in parts, shall be not very far from the truth as a whole.

That there is such a thing as a Kurdish nation in the modern sense is a sufficiently certain ethnological fact. The country of the celebrated Samuel of Bulgaria has not much more historic claims to individuality than the country of Xenophon's Carduchians, except that it is considerably less venerable. From the first historical mention of the inhabitants of the hilly districts which surround the head-waters of the Tigris and Euphrates and the great salt lakes of Van and Urumiah, the Kurds have had a somewhat definite position, though they have never emerged, even for a short time, into the condition of an entirely independent nationality of any importance. But they have given sufficient trouble to Persians of the old monarchy, to Greeks, to Romans, to Turks, and now, the cycle having apparently completed itself, to Persians again. The story of the religious wars of forty years ago, when they turned on their Christian fellow-countrymen, the Nestorians, and handled them with characteristic ruthlessness, is well enough known, and needs nothing more than a brief mention. The same may be said of the final suppression of this access of ferocity by Omar Pasha, and the much later participation (in an unexpectedly small degree) of the Kurdish tribes in the late war between Russia and Turkey. The present state of affairs seems to be this. For the moment the Kurds—Turkish and Persian indifferently—seem to be under the control; not of the feudal Beys who once dominated, but of an ecclesiastical chief, Sheikh Obeidullah. As they are orthodox Mussulmans, and as the Sheikh holds a high place in the Mussulman hierarchy, their old animosity towards the Christians has, according to custom, been merged in an animosity to the heretical Mussulmans of Persia. This of itself would account for the demonstration of a war of independence being made, not against the Sultan, but against the Shah, even if there were no other reasons. There are probably several others, obvious and latent. The military strength of Persia is far weaker than that of Turkey even in its present state. But at the same time the Persian Kurds have usually been held in more direct subservience to the central authority than the tribes to the west of the frontier, who, during long periods, have enjoyed a virtual autonomy. Very likely the rectification of frontier which was one of the results of the late war is distasteful to the Kurds. At the same time that war has put them in a much better position for offence. Although they took less part in it than was expected, they must by fair means or foul have been able to appropriate no small share of the shower of Colts, Winchesters, and Martini-Peabodys which the Porte lavished alike on its regular and irregular troops, while the Persian army, despite its European staff, is anything but well armed. The trade, too, passing through the Persian province of Azerbaijan is much greater and more tempting than that passing through the Turkish provinces of Van, Sheyrzur, and Mosul. All these things explain the direction which the storm has taken, though it is by no means certain that they explain it fully.

For it must be remembered that Persia and Turkey are not the only Powers interested in the matter. The province, now Russian for half a century, of Erivan, and the new Russian acquisitions in Kars and its neighbourhood, verge, the first very closely and the last not remotely, on Kurdistan. Russia is thus once more in the historical position of a man whose neighbour's house is smoking through the roof. The sternest denouncer of Russophobia must admit that the frequency with which this historic position recurs is, to say the least, remarkable. But the interests of Russia in the matter are not to be arrived at by an off-hand calculation. She has, it may be said with some plausibility, a great deal too much on her hands to want any more. The Chinese difficulty and the Turcoman expedition together ought to be nearly enough for her, even if she thinks that she can count for the time on the inactivity of England. Troubles on the Western Persian frontier would, moreover, directly occupy the Caucasian provinces, from which General Skobeleff must draw his principal supplies. Against this has to be set the notorious fact that Russian purchases of corn, indispensable to the expedition, have recently been obstructed

as forbidden [illegible] and the fact, less notorious but [illegible] negotiations have been going on for [illegible] between the SHAH'S Government and the Turcomans, not indeed of the Akkal Tekke tribe, but of Merv. The provision of occupation for Persia elsewhere, and the setting of her in such a position that she shall be in need of Russian help, are not despicable moves in the Russian game. It has been asserted, denied, and re-asserted, that applications for such aid have actually been made; while, on the other hand, the demands naturally made by Persia on Turkey, that the latter shall check her lawless subjects from invading a friendly Power's territory, put a fresh lever within reach of the persevering diplomatists of the active Russian school. These things being so, it is certainly not necessary to see all things in Russia in order to consider the situation at least interesting. In face, not merely of the considerations just advanced, but of the positively asserted statement that Russia has both been asked and has consented to give her assistance against the invaders, she certainly must be held to have an undoubted *locus standi* in the question.

For practical Englishmen of course the important part of that question is, how does it bear on England? It bears in many ways. The strengthening of Russian influence over Persia, the further inroad on the Anatolian dominions of the Porte which even a pacification of Kurdistan by Russian troops would bring about, may be of the class of consideration which some people affect to pooh-pooh as alarmist. There is another, however, which the very soberest critic can hardly afford to slight. The mountainous district of Kurdistan has hitherto been of little importance in history, because it has at no time belonged to an aggressive Power amply provided with resources and bent on using those resources for the purpose of southward expansion. Hill tribes, left to themselves, are mischievous and predatory, but nothing more. But the possession of Kurdistan means, if Kurdistan is the outwork of a great empire, the possession of Mesopotamia; and the possession of Mesopotamia means the barring of the only possible land route from Europe to India. A great deal of nonsense has been talked on the subject of that land route. But we suppose there are but few persons conversant with the subject and with modern history who, whatever they may think of individual plans and propositions, doubt that this land route will, in one or another form, at some time become an accomplished fact. No political party, save that of the extremest Radicals and that of non-interventionists *quand même*, will affect to consider it a matter of indifference to England that the route should be practically garrisoned beforehand by another Power, and that Power Russia. There is no need to insist on any positive stipulations which might oblige us to interfere with a Russian crossing of the frontier between Turkey and Persia. The representation of the facts ought to be enough. It is said, whether truly or not it is difficult to decide, that the Kurdish SHEIKH is well disposed towards the English and eager for some sort of recognition by us. There would seem, therefore, to be every reason for the offer, and perhaps something more than the offer, of good offices in the matter. Of course, if Persia can, unassisted or with the co-operation of Turkey, defend her frontiers from invasion and put down her own unruly subjects, so much the better. But, if she cannot, one Western Power at least must surely have a word to say to the repetition of the part played by Russia in 1848, with Kurdistan, instead of Hungary, for its scene.

ELECTIONEERING ODDITIES.

THE records of the Commissioners inquiring into various corrupt elections have lately grown dull, as they have been occupied with the mere fag-end of revelations the substance of which was already known. But this week a sudden air of liveliness has swept over them. We have had Lord BRABOURNE, we have had once more the delightful Mr. CROMPTON ROBERTS, and we had a real arrest and imprisonment. Of all the witnesses who have come forward Mr. CROMPTON ROBERTS is the most amusing, and Lord BRABOURNE is the most astonishing. No one invited Lord BRABOURNE to attend, for he naturally had nothing to do with the election which followed on his vacating his seat. It was only with this election that the Commissioners had to deal, for, in their opinion, they were precluded from going behind it. The Act directs that they shall not go further back in the history of a constituency when they have once reached a pure election. The election at Sandwich, in April, was uncontested; and, therefore, pure. It was only pure because the minimum of expense in case of a Conservative opposition was put at 5,000*l.*, and no Conservative could be found to rise to so high a figure. Still, as there was no contest, the election was pure, and the Commissioners, having found a pure election, held that this bounded their inquiries. Their interpretation of the Act may be technically correct, but it is obvious that the real history of a corrupt borough which ought to be traced out before Parliament deals with the case might be shrouded in a lamentable secrecy through the casual intervention of one uncontested election. Although, however, Lord BRABOURNE had, in point of form, no title to be heard, he was burning with a fierce desire to broach a theory which he had got into his mind, and he managed to give the Commissioners the benefit of it before he retired. This theory was nothing else than the marvellous, the astounding theory that the constituency of Sandwich is absolutely pure. It really is all that the most scrupulous moralist could wish a constituency to be. Last May, indeed, a sort of wave of sin swept over its undefiled soul, and when very bad men, strangers to Sandwich and ignorant of the native virtue of the electors, came and tempted Sandwich, it fell. But this was a mere aberration from virtue, as accidental as it was unaccountable. The inhabitants of Sandwich and Deal are, in the opinion of Lord BRABOURNE, "a most honest race of men." He knows them well, and he thinks that the boatmen who clamoured to be allowed to put up poles at a fancy price, the tradesmen who announced that they must have orders before they could promise, and the scores of paupers who took money from both sides, were all in their hearts the most pure, patriotic, and high-minded of men. Lord BRABOURNE had, of course, heard of the statement that the April election had been uncontested because no Conservative would pay 5,000*l.*; but he thought that there must be some mistake about this. The real reason why there was no contest was that he had helped to get a Bill for a railway from Dover to Deal. Nothing on earth would have tempted the pure-minded boatmen to vote against a man who had got a railway to their town. All the gold in the Bank of England would not have induced them to set up a pole, the sight of which could have vexed so great a benefactor. Then, while Lord BRABOURNE was the heroic author of a railway, Mr. BRASSEY was safe from a contest because he was "so much respected." He, no doubt, enjoyed and deserved general respect; for at the two previous elections he had spent a sum which popular, though exaggerated, rumour put down at 25,000*l.* At those elections Lord BRABOURNE paid his own expenses; but in April last he entered into an agreement with Mr. BRASSEY that Mr. BRASSEY should pay everything. He could not have given a more convincing proof of the respect he himself felt for his colleague or of the foundation on which the general respect for Mr. BRASSEY was laid. Lord BRABOURNE was desirous of being returned in order to render a last service to the party that was to make him a peer; but he did not intend to retain the seat, and therefore he did not think he ought to pay for it. Mr. BRASSEY'S seat would have been possibly endangered, and would certainly have been contested, unless Lord BRABOURNE had stood with him. It therefore seemed only fair that Mr. BRASSEY should pay the whole expenses of getting and keeping his seat, and that by this judicious arrangement Lord BRABOURNE should get a peerage in reward for his services, and should not pay a farthing. All that can be said is that very odd things are done at election-time by high and low, rich and poor.

The premature death of DICKENS has robbed that curious and fanciful student of contemporary manners and the public that admired him of a subject which only he could have treated with adequate effect and humour. Mr. CROMPTON ROBERTS was made for DICKENS, and DICKENS would have revelled in a theme full of happy suggestions, of infinite possibilities and of unexpected quaintness. Whatever else he may be, Mr. CROMPTON ROBERTS is always amusing. Much as in *Great Expectations* Mr. Wemmick suddenly exclaims, "Hallo! here's a church, let's go in," Mr. CROMPTON ROBERTS seems to have suddenly heard of Sandwich, and exclaimed, "Here's a seat; let me go in and

"become a live member of Parliament." His notion of getting into Parliament was one which might be derived from a hasty perusal of works of fiction. There the rich hero is returned, as a matter of course, simply because he is rich and a peer. Mr. CROMPTON ROBERTS knew he was almost painfully rich, and hoped he was a hero. He went to Sandwich to spend money as he thought he ought to spend it. He was told that the seat might cost about 10,000l., and he considered that just the sum which such a man as he was ought to spend. How it was to be spent was a matter with which he had no concern. It was to be spent in getting into Parliament, and that was enough for him. He was prepared to do the proper thing, whatever it might be, and it was to his mind exactly the same thing to pay 10,000l. to get into Parliament as it was to pay his entrance money at a club. With this conception of his duties and position, and with the money at his command, he went off to Sandwich, summoned his boys from Eton to witness his triumph, and established himself and his family at a leading hotel. There he lived not uncomfortably, but modestly, at a cost of 50l. a day for his personal expenses. The Commissioners, a little astonished at the expenditure, asked whether Mr. ROBERTS did not think it rather high? But he explained that, for a man of his means, 50l. a day at an hotel was really nothing. He was, in fact, economizing by condescending to exist for so paltry a sum at a Sandwich hotel. But Mr. ROBERTS came to Sandwich to work and not to play, and, being in good training through frugal living, he worked hard. He understood that a candidate must not only pay money but canvass, and Mr. ROBERTS walked about canvassing as hard as a professional pedestrian could have done. While canvassing he put down notes—copious, accurate notes—of all he heard or was told. It never occurred to him that these notes were a long record of corruption. They were to him merely a part of the performance. He knew he was doing everything that it is generally understood a candidate ought to do. He was spending money; he was leading a life of enforced simplicity at a provincial inn; he was walking as hard as he could walk, and he was busy in making entries. This, from the point of view of mere deportment, was all that could be wished, and he might flatter himself that his deportment as a candidate was unexceptional. When asked by the Commissioners, what his notes meant, he could only say that they were an effort of deportment, and that they must be taken as the simple story of what he had done. Opposite the names of persons on whom he had waited in his wanderings were found such remarks as "wants a 6," and when asked whether this did not mean "wants a "bribe," he mildly replied that it looked uncommonly like it. He merely noted that the man he was visiting "wanted a 6," as he might have noted that the man had red hair. What he wanted or what he got was nothing to a canvasser who had no other idea in his head than that he was posing as a candidate, and that if he posed properly and effectually, nothing more could be expected of him.

At Boston the Commissioners have asserted their authority and maintained their dignity by sending to prison a person who had been guilty of contempt of court. It is a harsh proceeding, and one to which the Commissioners were very reluctant to resort, but which in the circumstances was, in their opinion, inevitable. They gave the offender every possible opportunity of withdrawing what he had said; but he would withdraw nothing, and he was sent to prison. After he had been there a day he grew penitent, submitted himself to the Court, and was immediately released. What he had done was this. The Commissioners directed a prosecution before the borough magistrates of a person who had, they thought, been guilty of perjury before them, and they sent their shorthand writer to give evidence. Other persons instituted a second prosecution against a different person for perjury, and required the shorthand writer to stay to give evidence in this instance also. The Commissioners sent to the magistrates, stating that they were at a standstill in the absence of their shorthand writer, and asking that he might be released from attendance and sent back to them. With this request the magistrates complied. Mr. COOKE, the editor of a local paper, published a violent comment on this occurrence, headed "Strange Conduct of the Commissioners!" The Commissioners were doubtful whether this was a contempt of court or not, and they sent for Mr. COOKE and asked for an explanation. If Mr. COOKE had chosen to hold his tongue, he would have forced the Commissioners to decide whether his article was or was not protected by the reasonable liberty of the press. But, far from holding his tongue, he read in court an elaborate statement, in which he made two positive charges against the Commissioners; the first being that they had been actuated by improper motives in directing the prosecution for which they were responsible; and the second, that the reason they had given for recalling their shorthand writer — their desire to save public time — was not true, their real motive having been a wish to burke the second prosecution. These charges were made publicly in court, and addressed directly to judges while sitting as judges. There was thus no question at all of the liberty of the press. An editor cannot come into court and insult a judge with impunity merely because out of court he happens to edit a paper. The late Dr. KENEALY could have passed his life in the Queen's Bench having flings at the Chief Justice, if this had been permitted. The Commissioners rightly judged that, if under such provocation they did not show that they would defend themselves, their authority and influence would have been at an end. As Mr. COOKE has so quickly come to his senses, all has now ended happily; but the general position of all Election Commissioners would have been seriously weakened if his offence had been treated with a want of proper spirit and firmness.

COMMUNIST ATTACKS ON LANDED PROPERTY.

TO those who are fortunate enough not to own Irish land, the extravagant doctrines of the Land League are almost less alarming than the theories which are partially accepted by the Government. The projected Land Bill will certainly not be more moderate than the abortive Disturbance Bill, and if the hints and half-promises of different Ministers and of their zealous supporters may be trusted, it will effect a further transfer of property from the owner to the occupier. In the debates of the last Session Mr. FORSTER considered it a sufficient or forcible argument that the germ of the Disturbance Bill was, as he said, contained in the Land Act. In a certain sense he was right, for the Act of 1870 involved the principle of legislative interference with vested rights; but at the time Mr. GLADSTONE earnestly disclaimed the purpose of creating a precedent by a measure which was intended to provide for an extraordinary and anomalous state of circumstances. The exceptional nature of the Act is already forgotten; and its germs seem likely to attain a luxuriant growth. Spoliation may too probably transcend the limits of place as of time. Many projectors have within the last ten years founded on the Irish Land Act a claim for new agrarian legislation in England. Mr. GLADSTONE, who only listens to what suits his policy or inclination for the moment, lately assured Sir GEORGE BOWYER that he had never heard demands on behalf of English occupiers for violent remedies of grievances which he believes to be confined to Ireland. An instructive commentary on his assertion was furnished a day or two afterwards by a letter from a member of the Farmers' Alliance, to the effect that English tenants required only compensation for improvements, abolition of the Game Laws, and, finally, tenant-right. The term, as well as the claim which it expresses, is imported from Ireland, and its meaning is perfectly clear. Tenant-right means the substitution of a beneficial or saleable lease for the occupation of land at a rent fixed by agreement according to the market value. It has nothing to do with compensation for improvements; and it involves the gratuitous acquisition by the tenant of a share in the ownership of the soil. The origin of the system in Ulster has often been more or less accurately explained; but the historical controversy has little practical importance because there is no dispute as to the legal or customary right. The creation by law of tenant-right in England would be simple robbery, without the palliation of any economical advantage.

Mr. MACFARLANE, a Scotch representative of an Irish constituency, urges the conversion of Irish tenants at will into freeholders on the ground that the tenures of the peasantry in many parts of India have been recognized by the Government as hereditary. He is not the first theorist

who has assumed that the primitive civilization of India ought to be the standard of European legislation; but, if ryots own the soil of Madras, purchasers and heirs of purchasers or of grantees own the soil of Ireland by as complete a legal right as that on which any kind of property depends. The paramount claim of the occupier, if it has any existence, applies to England as directly as to Ireland. English landowners also derive their titles from purchase or inheritance, while the possession of their tenants rests exclusively on contract. They may be excused for considering with uneasiness doctrines and proposals which, if they are once established, will by logical necessity lead to projects of confiscation. They are also assailed with references to the legislation of STEIN and HARDENBERG, and of French Assemblies and Conventions. The Prussian serfs were relieved in the beginning of the present century, not from uncertainty of tenure, but from oppressive services which burdened their hereditary possessions. The peasantry of France also had to a great extent possessed the fee-simple of their lands before the abolition of feudal rights. It may be doubted whether, even in the height of the Revolution, any landowner was deprived of his estate by legislation, except as a personal and penal measure, founded on the pretext of disaffection to the new institutions. The nobles had in many cases to choose between emigration and the guillotine; but those who remained at home, and who had the good fortune to survive, retained their landed property. Even essayists on landed property are scarcely prepared to contend that English landlords are traitors. The Irish Land League for the present stands alone in its denunciation of landlordism, which means right to receive rents, as a crime.

Mr. BAXTER, who apparently wishes to lead the assault on landed property, lately contended that no man should be allowed to possess an estate too large to be efficiently managed. It is notorious that the best-managed estates, like the best-managed factories and shops, are generally the largest; but, to the imagination of projectors, landowners are, like BURKE'S democratic Duke who was marked out into ribs and sirloins, mere victims or subjects of economical experiment. Another condition of ownership is to be the possession of capital to be expended on improvements; yet, if a man has 1,000*l.* a year of rental, and 10,000*l.* invested in stock or shares, it would be a novel experiment to compel him to lay out the whole or part of his money on his land. If his investments produce four per cent., it is highly probable that improvements would only bring him in two per cent. If, on the other hand, they would be remunerative, in the majority of cases the desired outlay would be undertaken. It is a vulgar error to assume that the community has a special interest in causing land to attain its highest capacity of production. Any alternative mode of employing capital which gives a fraction of larger profit is economically preferable to high-farming. It is possible that small freehold occupiers might obtain a larger gross return from the land than large tenant-farmers; and in the opinion of some theorists there are also social and political advantages in attaching a large part of the population to the soil. As long as the present system lasts it will be impossible, as it would be absurd, to interfere by law with the discretion of the owner in dealing with his land. One of the many offshoots of Irish agitation is the establishment in Liverpool of a so-called Association of Highlanders for the purpose of depriving Scotch proprietors of the right of turning parts of their estates into deer-forests. It would be equally just to demand that a flower-garden or a cricket-ground should be, against the will of the owner, converted into a potato-field. Demagogues insist, with constantly increasing dogmatism, that property belongs to any one rather than to the proprietor.

The weakness of the landlords consists entirely in the smallness of their number. Since the introduction of the Ballot they have little or no Parliamentary influence, and their interests are regarded by strangers with indifference, and too often with ill-natured envy. Possessors of other kinds of property commit a suicidal folly if they countenance attacks on the rights of landowners. For the moment Irish Communism and English pedantry concern themselves with only one of the forms in which wealth is invested; but in almost every part of the Continent, and even in some parts of the United States, capital is the object of a hostility not less fierce than that of the Irish demagogues against so-called landlordism. The extreme revolutionary faction in France shrinks from a conflict with the five or six millions of peasants who would appoint an Emperor to-morrow if they thought him indispensable to the protection of their property. The drones whom the Communists threaten and purpose to plunder are the shopkeepers, the manufacturers, and the fundholders. The agitators use phrases as plausible as the rhetoric of the Land League to prove that the implements of labour ought to be provided by the State, and that the whole profit of production should be received by the workman. The danger of subversive theories is not less formidable in Germany. The Socialists or Communists control the representation of some of the great towns; and it is for the purpose of keeping them in check that Berlin and Hamburg are at this moment subject to a mode of government which is known as a minor state of siege. Prince BISMARCK, though he is sometimes thought to have a certain sympathy with the Socialists, is not a man to allow life and property to be endangered in preference to adopting necessary measures of coercion. It would fare ill with any of his colleagues who should talk, like Mr. CHAMBERLAIN, of the determination of the Government to rely exclusively on the ordinary law In England possessors of a competence are happily numerous, and there are probably more wealthy families than in any other European country; but neither class ought to wrap itself in a false security when Continental agitators declaim against capital, and Irish demagogues against rent. It may or may not be possible at some indefinite future to organize society on a basis which has never yet been tried. At present civilization rests on the acknowledgment of private property as an ultimate and unquestioned principle. Those who tamper with any form of ownership disturb the sanction on which the entire system reposes. Irish anarchy, notwithstanding Mr. GLADSTONE'S confidence, threatens English order.

DR. HUNTER ON INDIA.

DR. HUNTER'S first lecture on the text, What the English have yet to do for the Indian people, might be more accurately described as a lecture on the unintentional evil which the English have already done to the people of India. He promises, indeed, in a second address to set out the remedies to which he looks for a mitigation of this unintentional evil. But, in defining the quarter whence these remedies are to come, he pretty well discredits them beforehand. "The true remedies," he says, "rest with the people themselves," and in the sense that they rest with no one else, this statement is strictly accurate. But to say that they rest with the people themselves when applied to a population like that of British India is pretty well tantamount to saying that there are no remedies. The evil is one with which we are familiar in Europe; but the motives which can be appealed to, however imperfectly, in Europe, have no existence in Asia. The population of India is a population of small husbandmen thickly planted on the land; with, in the great majority of cases, no other employment than agriculture open to them; tied by custom, which has become nature, to the district in which they were born, and where their ancestors have lived before them; bound by religious or semi-religious considerations to marry very early; and accustomed to subsist, even under favourable conditions, on little, if any, more than bare necessaries. When this has been said, the hopelessness of the case becomes at once apparent. All suggestions for the improvement of the condition of the people in European countries resolve themselves into such a rise in the standard of comfort as will lead them to prefer emigration or postponement of marriage to the privations which they must endure if they go on living and multiplying where they are. But every one of the circumstances just enumerated goes to make any such rise in the Indian standard impossible. A whole system of religion is associated with their early marriages; and a man whose salvation in a certain sense depends upon his having a son to perform the requisite sacrifices after his death is not likely to leave the provision of a son to the uncertainties of later life. He will save his soul by marrying as soon as he has the chance. He has never known, either by experience or tradition, a mode of life radically different from his own, and though, of course, he would rather have a full meal of rice or millet than a scanty one, yet the difference between the two does not seize upon

his imagination. Whether it be from climate or from an exclusively vegetable diet, even starvation does not seem to have the terrors for an Indian population that it has for us. They die almost as contentedly as they have lived, and they would at any time prefer death to any radical change in their method of life. A population endowed with such characteristics must, if it is to live in anything like comfort, be kept small in proportion to the land available for its occupation. It is difficult, even after all that has been said on the subject, to realize how great a difference the British conquest has made in this respect. "When India passed "into our hands," says Dr. HUNTER, "there was plenty of "good land for every one who wanted it." In 1789 it was ascertained that one-third of Bengal was unoccupied. A population so situated had little to fear either from landlords or usurers. If the peasant thought his rent too high, he moved a little way off, and found land which was to be had almost for the tilling. "The competition was "among the proprietors for tenants, not among the tenants "for land." It was of little use for a usurer to seize a peasant's holding in discharge of a debt, when the peasant had nothing to do but transfer himself and his implements to an adjoining plot of ground.

Unfortunately this happy state of things could not be perpetuated under English rule. To do, or even to allow, evil that good may come is not a maxim of English policy, and almost from the first the British Government set itself to put an end to the constant wars and plunder which had kept down the population under native rule. There was little fear of numbers increasing too rapidly when hardly a year passed without large districts of India being harried by invading or retreating armies, or by brigands recruited from these armies when disbanded. No record has been preserved of the multitudes who perished in this way, but some estimate can be formed of them by the extraordinary increase in the population the moment this check was withdrawn. At first it was only war that the British Government attempted to deal with. But as time went on, and communication became easier, and the scope of scientific knowledge wider, the Government was not content thus to limit its efforts. It now deals with pestilence and scarcity as well as with war. Neither epidemics nor famines are suffered to run their course. The Government has its doctors and drugs to meet the one, and its relief works to meet the other. The result of all this is simply astonishing. We know something of the destitution which a bad harvest can produce in Ireland, where there are 169 persons to each square mile. But there are thirteen districts of Northern India with an area equal, when taken together, to the area of Ireland, which have to support an average of 680 persons to the square mile, or just four times as many as the same amount of land has, on an average, to support in Ireland. The proportion of land under food crops to the population in Bengal, the North-Western Provinces, Oudh, and Madras is less than an acre per head, and in parts of Bengal it is only half an acre per head. This growing density of population has had disastrous results upon cultivation. No land off which any crops at all can be gathered can be left to go untilled when the demand for food is so great. The best lands have long since been brought under cultivation, and it is doubtful whether some of the land which has latterly been resorted to can ever yield enough to keep the labourers on it alive. Even this is not the worst feature in the case. Land that was once fertile is now fertile no longer. It cannot be suffered to lie fallow, and yet the constant cropping to which it is subjected is surely, and not always slowly, wearing out its powers. Formerly there was always wood to be had for burning; now the jungles have been cleared to such an extent that cow-dung has in many districts become the fuel most in use among the people. Manure cannot be both burnt and used as manure; and the land is thus deprived alike of the wood ashes, which are no longer forthcoming, and of the cow-dung, which is otherwise employed. Even the oxen themselves are not so serviceable as they once were, inasmuch as a large part of the village pasture lands have been brought under the plough, and the cattle are consequently worse fed and less capable of work.

Some way out of this seemingly hopeless state of things may be disclosed in the future, but it would be idle to pretend that any has yet been suggested. What can be done with people who would rather die where they are than go to live a few hundred miles off? The Government has set itself to protect the peasantry against the exactions of usurers, and against the demands for increased rent that come from the landlords. We shall not attempt to estimate the merits of the measures directed towards these ends which Dr. HUNTER enumerates. They are marked by that ardent desire to benefit the mass of the people which is rarely absent from the acts of the Government of India, and they may undoubtedly serve as a safeguard against individual acts of oppression. But so long as the main lines of the situation remain unchanged, the question how are the people to be fed will present itself with all its old urgency. Every fresh diminution of anxiety or suffering will only tend to make them more prolific, and if every landlord were shipped off from India to-morrow, the peasant proprietors who would step into their places would go on marrying and bringing up children until their poverty was just as great as before. We have, with the best intentions, applied European ideas of government to a people whose whole conception of life is opposed to the European conception of it; and we are now beginning to discover that the process, beneficial as it seemed at first to be, is attended with some terrible drawbacks. In Ireland, where prudential checks on the increase of the population were almost inoperative, there was at least the resource of emigration. When it was made plain to the people that they could not live on one side of the Atlantic, they were willing to cross to the other. In India the absence of prudential checks is immeasurably more complete; all the material checks have been removed by the action of the British Government; and there is in the people a customary and traditional dread of leaving the place they have always lived in, to which even the affection of an Irish peasant for his country is as nothing. These are the facts which it seems unhappily reserved for the rulers of India to watch without being able to alter.

THE POETRY OF SLEEP.

POPE says somewhere that he cannot sleep without a poem in his head, and elsewhere observes, with some inconsistency, that verses throng into his mind and keep him awake in spite of the drowsy influence of lettuce. It seems probable that poets, as a rule, have suffered a good deal from the infliction of thick-coming thoughts which banished slumber. Certainly many of them have propitiated sleep with song, and it may be not uninteresting to examine a few of the votive poppy-wreaths laid on the altar of slumber. For beauty and brevity of expression there is nothing in literature more remarkable than the single line of the Psalmist, "He giveth his beloved sleep." Five words contain all that Mrs. Browning has expanded into a long piece of verse, chiefly memorable for the recurrence of the ancient refrain. But if a sleepless man would propitiate the God of Rest, there is no better inscription for the altar of Morpheus than the speech of Hera in the Fourteenth Book of the Iliad:—

Ὕπνε, ἄναξ πάντων τε θεῶν πάντων τ' ἀνθρώπων,
Ἦ μὲν δή ποτ' ἐμὸν ἔπος ἔκλυες, ἠδ' ἔτι καὶ νῦν
Πείθευ· ἐγὼ δέ κέ τοι ἰδέω χάριν ἤματα πάντα.

"Sleep; King of all gods, and of all mortals, hearken now, prithee, to my word, and, if ever before thou didst listen, obey me now, and I will be grateful to thee all my days." The whole passage is one of singular grace and sweetness. Sleep is conceived of by the poet as a young god the lover of Pasithea, one of the fairest of the Graces. Hera goes to seek his aid, and meets him wandering through the dreaming town of Lemnos. By the promise of Pasithea's hand, she bribes him to lull Zeus into forgetfulness. Sleep changes himself to the shape of a bird, probably a night-bird, and conceals himself in the boughs of a great pine-tree on Ida. The clearness of Homer's vision is very remarkable; living in an age when the art of sculpture was at its rude beginnings, the poet conceives of Sleep no less distinctly than did the sculptor who, centuries later, wrought the bronze head of Hypnos now in the British Museum. The face is a beautiful one, innocent and drowsy, and the soft, noiseless wings of a night-bird are fitted to the head. There is something delicate and caressing in the epithets which Homer, and after him the other Greek poets, apply to Sleep. He is "sweet Sleep," sweetest, as Odysseus found on board the Phæacian bark, when "most like to death"; "then fell delicious Sleep upon his eyelids, Sleep unbroken, the sweetest of all, and the nearest kin of Death." Here the thought of Homer touches that of Socrates, who observes in the *Phædo* that man's happiest moments are passed in sleep so sound that consciousness is utterly lost and undisturbed even by dreams. Probably the Greeks did not suffer much from *insomnia*. Nerves had not been invented, and people lived almost entirely in the open air. A comic character in Aristophanes was kept awake, indeed, by insects which still make night hideous in modern Greece. The two old fishermen in Theocritus could not sleep soundly, because they were

half starved. We must go as far as the feverish life of imperial Rome to find, in Mæcenas, a statesman as sleepless as Prince Bismarck. The Greek poets, in general, think of sleep as the natural and pleasant occupation of freemen in the summer noons, when the citizens would leave the towns to lie on grass "more soft than slumber," within hearing of the murmur of waters and of the bees in the lime trees.

The poets of the middle ages were obliged to feign a want of sleep, whether they felt it or not. It was part of their machinery to begin a poem by pretending that, after long lying sleepless, they arose and wandered into a wood, where they met many a fairy vision. Yet Chaucer gives a very truthful description of what the late Mr. Charles Collins, in the *New Sentimental Journey*, called "the bad night candid," when you not only cannot sleep, but are well aware of the hopelessness of the effort:—

> As I lay in my bed slepe full unmete
> Was unto me, but why that I ne might
> Rest I ne wis, for there n'as erthly wight,
> As I suppose, had more of hertis ese
> Than I, for n'ad sicknesse nor disese.

Of all invocations of sleep, the most famous is probably that of the wakeful usurper, in *Henry IV.*:—

> O sleep, O gentle sleep,
> Nature's soft nurse, how have I frighted thee.

No poet, however, has observed the phenomena of a coy and hesitating sleep more closely than the old French writer, Pontus de Tyard. He appeals to sleep as the lord of all the army of phantasms that flit before the drowsy, but not yet unconscious, brain, and appear to be dreams in the making:—

> Come, Sleep, and cast thy wings about my head,
> And thine own temples shall be garlanded
> With drowsy poppy leaves and labdanum.

The most pathetic lines on sleep are those of Scarron's self-made epitaph. The sick jester was sleepless for many nights before his death, and looked impatiently, as he says in the lines which we quote in an English version, for his dreamless repose:—

> Wayfarer, be thy footsteps light,
> I pray you that ye make no sound;
> Here, this first night of many a night,
> Poor Scarron sleeps—in holy ground.

The translation, as usual, is treacherous. Scarron says nothing about "holy ground":—

> Passant, ne fais ici de bruit,
> Garde bien que tu ne l'éveilles,
> Car voici la première nuit
> Que le pauvre Scarron sommeille.

The thought already existed in a briefer shape—

> *Hic quiescit qui nunquam quievit, tace!*

It is in modern poetry—poetry of the age of nerves, anodynes, anæsthetics—that sleep, as might have been expected, is most frequently and piteously invoked. There is something practical and like the man in Wordsworth's famous sonnet which enumerates all the spells by which, through three long nights, he has summoned sleep in vain. He has counted visionary sheep, and has thought of all monotonous and slumbrous sounds and sights, but he is wakeful as ever, and nervously watches for the moment when the birds will disturb him with their intolerable songs. A poet of the Greek anthology had the same apprehension of the swallow's shrill morning chirp:—

> No more for my Rhodanthe would I weep,
> But rest awhile with poppied lips, if ye,
> O twittering swallows, would but let me be,
> Nor dart below my eaves with maddening cheep.

So says Rufinus, as Englished by Mr. Gosse. No one has said better things about sleep than Coleridge. "Sleep, the wide blessing," a half-line from the verses on "The Pains of Sleep," has an epic breadth. In contrast with these stanzas, the Ancient Mariner's blessing on sleep seems to exhaust the subject:—

> Oh sleep! it is a gentle thing,
> Beloved from pole to pole!
> To Mary Queen the praise be given!
> She sent the blessed sleep from Heaven
> That slid into my soul.
>
> * * * *
>
> I moved, and could not feel my limbs;
> I was so light—almost
> I thought that I had died in sleep
> And was a blessed ghost.

Among lullabies we might praise the drowsy cadence of a modern Greek cradle-song, and this sleepy chant that lulls the peasant children in France:—

> Passez, la dormette,
> Passez par cheux nous,
> Endormir gars, fillettes,
> La nuit et le jour.

La Dormette is a mythical character, a good old fairy, who is supposed to wander in the dusk, scattering an invisible powder on the sleepy eyes of children. Blake's cradle-song is very pretty, but rather too long, and not too grammatical in the later verses:—

> Sweet dreams, form a shade,
> O'er my lovely infant's head;
> Sweet dreams of pleasant streams
> By happy, silent, moony beams.
>
> Sweet sleep, with soft down
> Weave thy brows an infant crown;
> Sweet sleep, angel mild,
> Hover o'er my happy child.

There is something of the disconnected coherence of the visions of the night in Beddoes's "Dream Pedlary," which reads like a memory of a poem heard in sleep:—

> If there were dreams to sell,
> What would you buy?
> Some cost a passing bell;
> Some a light sigh,
> That shakes from Life's fresh crown
> Only a rose-leaf down.
> If there were dreams to sell,
> Merry and sad to tell,
> And the crier rang the bell,
> What would you buy?

But a sleepier and more soothing song than this is Sydney Dobell's chief success in verse, a passage of drowsy and monotonous music that rings

> On the margin grey
> 'Twixt the soul's night and day,
> Singing awake away
> Into asleep.

Probably a wider research than we have made would discover many more lullabies and songs of sleep, which might make a charmed volume for wakeful eyes. Mr. Tennyson's cradle song in *Sea Dreams*, and the verses from the *Princess*—

> Now sleeps the crimson petal, now the white—

with the languid choral music of the *Lotus Eaters*, should not be omitted. Shelley's poem, "The Magnetic Lady to Her Patient"—

> Sleep on, sleep on! Forget thy pain,
> My hand is on thy brow—

would try the force of its mesmeric spell. Shelley's poem on Night, too, might claim a place in a volume of lullabies for grown-up children by virtue of its lines—

> Thy brother Death came, and cried,
> "Wouldst thou me?"
> Thy sweet child Sleep, the filmy-eyed,
> Murmured like a noontide bee,
> "Shall I nestle near thy side?
> Would'st thou me?" and I replied,
> "No, not thee!"

Filicaja's ode must not be forgotten, nor Cowley's, nor Denman's song in *The Sophy*. But Keats's sonnet may close the list of invocations which Homer made Hera begin:—

> O soft embalmer of the still midnight!
> Shutting, with careful fingers and benign,
> Our gloom-pleased eyes, embower'd from the light,
> Enshaded in forgetfulness divine:
> O soothest Sleep, if so it please thee, close,
> In midst of this thine hymn, my willing eyes,
> Or wait the amen, ere thy poppy throws
> Around my bed its lulling charities;
> Then save me, or the passed day will shine
> Upon my pillow, breeding many woes;
> Save me from curious conscience, that still lords
> Its strength for darkness, burrowing like a mole;
> Turn the key deftly in the oiled wards,
> And seal the hushed casket of my soul.

In spite of Keats, and of the proverb about the sleep of the just, we fancy that conscience keeps few people awake. Coffee, and overwork, and tobacco, and the noises of the night may demand chloral, but not conscience. Men have lain awake, and the night has fretted them, but not for conscience.

HOW NOT TO DISCOURAGE FRIENDS.

IT is probably seldom that an historic saying receives such frequent illustration in one day as Pym's famous dictum received at the beginning of the present week. On Monday a note in the *Pall Mall Gazette* on the subject of the impudent Irish argument that atrocities are committed on this side of St. George's Channel as well as on that; Mr. Forster's address to the press on the subject of the Boycott Rescue Expedition; and Mr. Charles Russell's letter on the subject of Irish grievances, all illustrated the sagacious principle of Strafford's enemy. Very likely all the three parties concerned may be rather indignant at having the friendship of Mr. Parnell and his crew ascribed to them. We only do this on the principle of *idem velle et idem nolle*. We do not for a moment believe or suggest that any English Radicals specially approve assassination, or that many of them are consciously anxious for the dismemberment of the Empire, and the constitution of Hibernian, Caledonian, and, for aught we know, Northumbrian and South-Humbrian republics. But the Land League is doing their work for them by attacking the principle of landlordism, which they probably hate more than they hate anything else, because it is one of the mainstays of all the other institutions they dislike. If the Irish are not Mr. Forster's friends, they ought to be; for with a Tory representation of Ireland and Scotland Mr. Forster's party might languish in opposition for ever and a day. As for Mr. Charles Russell, he is one of the scanty band who have discovered that, with a sound Liberal representation—a representation neither Tory nor Home Rule, but with just the least little taste of the latter flavour—Ireland would blossom like the rose. So all three of the authors of the expressions just quoted may be said to have good *primâ facie* reasons for not discouraging the Irish as far as they can help it. They have all certainly endeavoured, to say the least of it, to minimize their discouragement.

So long as the argument about English atrocities was confined to Mr. Parnell and his henchmen there was no need to take notice of it. People who, in face of the cheques which Sir Francis Truscott used to sign weekly or thereabouts during the whole of last winter, talk about the Irish having been fed by the contributions "of every civilized country except England," deserve no further attention than to have the reports of their speeches tossed back to them with "Mentiris impudentissime" written across. But when respectable English journals take the same line about English and Irish virtue, it seems worth while to teach them a lesson in elementary ethics. The sapient persons who argue that because half-a-dozen ruthless murders, and perhaps some scores of minor outrages, take place in a few days between Berwick and Penzance, Englishmen ought not to feel so much "savage impatience" at Irish crime, have apparently never considered that the impatience, savage or not, is felt, not so much at the crime as at the motives which induce it and the reception given to it by public opinion. So long as human nature is human nature, individual greed or ruffianism will find vent in crime; and, by the way, Irish human nature contributes a good deal of this sort to the crime-total of English towns. But the whole sympathy of the English public is thrown at once on the side of the victim. The whole sympathy of the Irish public, or at least of that portion of it which Englishmen regard with impatience, is thrown on the side of the assassin. It happens that in the group of crimes which has marked the beginning of the winter among us there are two curiously typical examples of this. When the principal actor in that singular and ghastly business at Manchester on which justice has not yet authoritatively fixed a name, asked his trusty servant to help him out of his difficulty, the answer was, "Yes, provided it's not murder." When the St. Albans murderer foregathered with a friend while the news of the crime was travelling along the road, the friend's first words when his suspicion was aroused were, "I hope you haven't anything to do with this business." Change the circumstances for those of a typical Irish crime, and the speeches would probably run (that is, if the speakers expressed their real minds), "Oh, if it's only murder, I'll help you," and "I hope it's yourself that's been doing the good work." It is this, not to mention anything else, which irritates Englishmen, and which seems to them to require displays of that "vigour" which the apologists of the mild assassin so earnestly deprecate. The lesson is, as we have said, an elementary one, and does not need to be inculcated on any one save those who have shown themselves in need of it. But, as they apparently do need it, here it is for them.

Mr. Charles Russell may be treated in a less scholastic manner. There is a fine unconscious humour—it is odd that the supporters of the present Government rarely display any humour which is not unconscious—about his letter. Mr. Russell "does not believe that insecurity is widespread." We have no doubt that it is not, as far as concerns people like Mr. Russell, who are perfectly secure. The strange thing is that the people who are insecure seem to be of a different opinion. Mr. Russell might have suggested to a poet in the days of the beast-fable a fox in a pheasant cover on the first of October. "Insecurity," says Reynard to the unlucky birds who are dropping around him, "is not widely spread. *I* feel quite safe. There are, I assure you, none of the signs of insecurity. Those signs are horrid parti-coloured dogs, and men in pink coats, and I can see none such about. There is really no harm at all in these things you call guns. My relations have, I am told, sometimes suffered from them, but I have been assured that it was the purest accident." Perhaps Mr. Austin Dobson, who has shown no small faculty in following Gay, will take up this hint of ours. But Mr. Charles Russell has plenty more to say besides assuring persons of the class of Lord Mountmorres and Mr. Boyd that there is no widespread feeling of insecurity in Ireland. He makes himself something like an accomplice of the apologists of assassination by suggesting that at least two murderous outrages may have been traceable to causes wholly different from agrarian causes. Then, scaling his climax with true professional skill, he proceeds to parody Clive's famous speech. He stands astonished at the moderation of the Irish people. What makes Mr. Russell surprised is, apparently, not that the Irish have shot so many landlords and mutilated so many cattle, and threatened or assaulted so many law-abiding persons, but that in each case the outrages have been so few. At least this is the only way in which we can construe his astonishment. The people, he says, are normally on the verge of starvation. There are a good many people in England who are normally on the verge of starvation, but it does not usually occur to them to shoot some one else as a palliative. Then Mr. Russell is very angry with the landlords. Public opinion points, says he, with remarkable directness and force to the Land-laws as the cause of Irish distress. Public opinion very frequently means the opinion of the speaker or writer, and we have certainly a right, if we cared to employ Mr. Russell's language, to say that public opinion points with remarkable directness and force to causes quite different. Then Mr. Russell notes the absence from the landowners' deputation to Mr. Forster of "representatives of the families of Devonshire, Portsmouth, Fitzwilliam, Downshire, Powerscourt, and Bessborough." Mr. Russell has a reputation as an acute lawyer, but he could hardly have used a more dangerous argument than this. Three, at least, of the persons he mentions are persons whose Irish property forms but a very small proportion of their total possessions, and who can therefore afford to put up with inconveniences which would ruin purely Irish landlords. It is certainly odd that Irish peers and squires should be rated first and robbed afterwards because they have not the docks of Barrow, the coal-mines of Elsecar, or Lord Portsmouth's broad and peaceable acres in Hampshire and Devonshire, to enable them to play the liberal landlord with their Irish tenants.

We have kept for the Irish Secretary the place of honour in processions—the last. Far be it from us to disapprove of the energetic action taken to prevent civil war in Mayo. The danger of that civil war has indeed been doubted. The skulking ruffians who stalk solitary landlords may seem unlikely to try conclusions with a numerous force of sturdy labourers, well armed, and keeping up a good watch. But, however this may be, Mr. Forster's exceeding activity, admirable as it is in itself, seems to be a little tardy. Captain Boycott was left to his couple of policemen, but the amiable Land Leaguers of Mayo require, it seems, a brigade of all arms to protect them from the ferocious invaders from the North. However, the Secretary's speech explains the attitude. It turns out that the Government have by no means regarded the cowardly persecutors of Captain Boycott with equanimity or indifference. They have been, as in another famous case, "longing to be at 'em." But it was all Captain Boycott's fault. He would not say what number of men he required for the saving of his crops. Now that Captain Boycott, or his would-be rescuers, have said what number of men are required for this purpose, a cold fit seems to have succeeded the hot one in the Chief Secretary's mind. They are far too many. Such a collection of armed men would be an illegal gathering. We should very much like to know how many armed gatherings of Land Leaguers have taken place since Captain Boycott's case was first known, and with how many of these the Government have interfered. If Mr. Forster would employ in this direction the arithmetical methods he employed once before, it would be probably easy to show that several millions of persons have illegally gathered in the manner which, when it is resorted to for the defeat of the Land League machinations, Mr. Forster proceeds against with foot and with horse. In the long run, doubtless, the presence of the troops will be a great advantage to Captain Boycott, but it is a little singular that Mr. Forster should never have thought of this fact until Captain Boycott's friends were on the very eve of giving him alternative assistance. So long as the free exercise of the just rights of property is secured, it matters little of course who secures them, or rather it is very much better that they should be secured, however late, by the proper and responsible authorities. But it is difficult not to notice a certain inequality in the attitude of the Irish Secretary towards the aggressive Land Leaguers of Connaught and the Tory rescuers of Ulster. If the only possible alternative, in the face of his Government's supineness, seems to Mr. Forster so shocking when it is on the eve of being put in force, might he not have been expected to make it needless before? But to do this would have been to discourage possible, if fractious, friends, while to frown on the Orange expedition is only to discourage avowed foes. Irresolution, therefore, in the first case was prudent, in the latter it would have been obviously idle. We are very glad that Mr. Forster has at last made up his mind that the duty of a Government is to govern, and that Mr. Gladstone has endorsed the resolution. We should have been more glad still if so long a time had not been taken about it. There is, for instance, the case of the "Land League Farms," which are either kept unoccupied, or, in defiance of all law and justice, are sown and cropped by unauthorized persons. An exceedingly illegal assemblage took place last harvest on one at least of these farms; but we do not remember that Mr. Forster protested against it or made any attempt to prevent it. Perhaps some invaders from the North might have interfered with this remarkable system of cultivation as well as with the system which has condemned Captain Boycott's potatoes to rot in the ground. But this would, no doubt, have shocked Mr. Forster again. It was not a thing requiring the interference of infantry and cavalry that hundreds of people should reap the crops which belonged to the landlord; but it was such a thing that hundreds of people should carry Captain Boycott's crops for their lawful owner. For circumstances alter cases, and it does not do to discourage friends. To do the friends justice, however, they seem not to be grateful for Mr. Forster's reluctance to discourage them. But the principle is everything; and the principle has been duly observed.

THE STRATEGY OF THE FUTURE.

THE military world has been talking tactics for years past with scarcely any intermission, and has arrived at conclusions—some definite, others very indefinite—on several important questions connected therewith. Meanwhile strategy, which is the art of combining the disposable *matériel* and *personnel* of an army or armies in such a way and at such a time as to secure tactical predominance at the decisive point, has retreated altogether into the background of discussion. The reason of this is obvious. Speaking broadly, it is time enough to consider, when occasion arises, how forces may be utilized; but there is not time when war is at the gate to create, organize, or instruct them. Strategy demands a weapon instant to its hand; without such weapon ready, polished, sharpened, it can, unless in very exceptional circumstances, accomplish little or nothing. Therefore, soldiers in all countries have been busied in devising how they may best give strategy its opportunities by fur-

nishing it with the newest and most efficient tools. If we look at the long list of patents taken out year after year for inventions, we find that the wit and ingenuity of some of the most gifted men in every European country are constantly directed to the perfecting of the mechanism of destruction. So much is this the case that a tacit assumption seems to prevail that battles, both ashore and afloat, will in a far greater degree than formerly be decided by purely mechanical agencies. There is undoubtedly a feeling amongst us that our sailors, pent up within iron prisons, will not in future have room or occasion for the exhibition of physical prowess and skill, or for the display of moral qualities. We seem to see only steel pitted against steel, and a happy-go-lucky contest between explosives, in which the ship not blown into the air, or not hewn in two and sent to the bottom, may possibly be victor. On land we find the French and the Russians lamenting that the era of bayonet tactics has passed away, and that their superiority to other nations on that score has become useless. And British soldiers of the old school, and indeed of the new, lament too that *their* superiority with the bayonet will have small chance of illustration any more. All soldiers in every nation appear to feel that, through improved appliances of war, some moral excellence peculiar to themselves is in danger of being obscured. Of what avails impetuosity which must run the gauntlet of a thousand yards of fire? The old shoulder-to-shoulder defence, sustained with unconquerable stanchness against overwhelming odds—how is the very spirit of such formation now scattered to the winds!

In our opinion it is quite possible to make both too much and too little of changes effected by mechanical improvements, and through these in the mechanism of tactics. So far as the question is one of armament only, it is abundantly clear that the best troops in the world cannot be trusted to stand up to others better armed than themselves, and knowing how to use their weapons with effect. The question, however, has lost a good deal of its importance now that the troops of every Power are virtually armed alike. Indeed they would be on the same relative terms as in the bow-and-arrow or Brown Bess days, but that skill will now command greater precision. Aptitude for arms may be said to be to some extent a heritage of certain races. But when we come to the mechanism of tactics, what we have learned through late experience is mostly of negative value. We have acquired the certainty that modern fire will dissipate all exposed formations in anything like close order. Very few authorities, however, seem agreed as to the degree and method of dispersion rendered thereby necessary. We have by us several plans for manœuvring companies, battalions, and larger bodies for attack, propounded by various officers, who are presumably of opinion that the method laid down in the drill-book will not meet all emergencies. We believe that they are quite right in this supposition, and that no formation can be the best if it is not subordinated to actual conditions of combat and features of ground which naturally vary on every occasion. It is a common delusion to suppose that the German successes against France were due principally to the virtues of a particular tactical formation. "Success," says Lord Chelmsford, "is apt to mislead, and it seems to me that superior numbers, entire disregard for loss of life, and the faults of the French, had probably much more to say to the victories of the Germans than the tactical formation by which they were won." And the Duke of Wurtemberg says:—"One must be cautious in drawing conclusions regarding the possible results of tactics in the future from what the Prussians succeeded in doing." We allow, what indeed cannot be disallowed, that, *cæteris paribus*, the best guns and rifles and the most appropriate manœuvres will win the day; but the moral and intellectual side of war is bound to play as great a part as ever it did. Prescience and genius, courage and stanchness, will make their mark, however much material conditions may shift and change. When we hear, as we have heard it said, "that Napoleon would be nowhere nowadays," we reply, If his was true genius, that genius would assuredly utilize to the same extent, though not in the same way as before, the material circumstances of its surroundings. To understand fully why the moral conditions of war will still bear as conspicuous a share as ever in its successful conduct, it must be borne in mind that in the term *moral* is comprehended the spirit animating every branch of warlike administration and every soldier with the colours. The prescience which takes account of the preparations and potential force of possible foes, which provides for the intelligent instruction of its own instruments, which recognizes the value of mechanical improvements and takes measures for securing the best armaments; the virtue, the patriotism which aim at making of honest citizens dutiful and valiant soldiers—such are the moral and intellectual arms furnished with which a nation moves into the field with bold and confident front. But, though art has not lost its importance, and though war is not at all likely to degenerate into a vulgar matter of "hammer and tongs," it must be allowed that many conditions are now exploded under which certain feats of strategy were possible. In some ways the strategical art has found greater limitations to its exercise during the last few years than in all the centuries separating the passage of the Alps by Hannibal from the "turning" of the Alps, as he himself expressed it, by Napoleon. It would be found impossible now to pursue undetected the manœuvre which led to Marengo. Again, the celebrated manœuvre of the Consul Nero, when, leaving in his lines before Hannibal a small force—a dummy army—to blind him, he marched north to forestall the succouring army of Hasdrubal, was a feat which might have been repeated with success down to the other day. It would be little likely to succeed now. Telegraphs, railroads, improved communications, ballooning, signalling, messenger-pigeons, all such means as have been devised for cheating time and distance, have, as it were, blocked some of the sources of strategy. The stream, however, is but dammed up to overflow on other lines, as we shall presently see.

The study of the art of war in its highest branch, strategy, is not a popular one; neither is it, when confused, or at any rate encompassed, by technicalities, one likely to lead to much practical edification. Strategical combinations under imaginary conditions in time of peace are rightly regarded as studies chiefly suitable for officers who are likely to be called to commands of importance, or for professors and students of military history. When war is once begun, of course everybody becomes a strategist. The one special point, however, to which we would call attention here may receive very practical application. This point has reference to the action of colossal numbers, and may be set down as one altogether new. The world has never yet seen war on a national scale. There have been, as in 1812-13-14, many armies, and those numerically as well as otherwise formidable, engaged simultaneously on one theatre. In 1870 the Germans employed several large armies; and the French, too, made considerable levies. But all the conditions of war are different from what they were in the Napoleonic era; and since 1870 several nations have turned, or are turning, almost their entire male population into soldiers. When war occurs again among the great Continental Powers there will be such a sight presented as never was seen before. There will be in the first line a chain of armies furnished with superb *matériel*; in the rear will be reserves of trained troops exceeding in number the biggest armies of former times; and these reserves will rest on a succession of strong fortresses and entrenched camps held by enormous garrisons. We are at once arrested by the thought how, in the first instance, will the time-honoured principles of strategy be affected? It has always been accepted as excellent art to contrive to concentrate at the decisive point five men to every four of the enemy; it is an axiom that a general should endeavour to operate on the communications of his foe with a view of cutting him off from his base of supplies, threatening his capital, &c. These have been the stock-in-trade devices of all good generals, though it has been given to very few to know how to execute their plans at the right time. But how must the situation be modified at starting when each side has half a dozen bases of supply, when the thrusting aside of one army may be only throwing it on the support of a second and a third, when concentrations may be liable to become so unmanageably large that each side is driven to resume its original dispersion! How could one army of, say, a hundred and fifty thousand men, having succeeded in manœuvring or beating the foe in its own front out of some position, proceed towards his capital, having armies perhaps on either flank, and a hornet's nest of reserves in front, and a fortified city lying at the end of its proposed march? Could such an army, victorious over its actual antagonist, halt beyond to undertake a siege? Could it afford to pass by an entrenched camp? It is clear that with a multiplicity of armies in the fighting line, based upon vast reserves and garrisoned fortresses belted with forts, the strategical problem becomes far more complicated than before. Those who study the statistics of armies will bear us out in the assertion that, if peace holds for only a brief period longer, the number of combatants in a war, say, between France and Germany, or between Germany and Russia, will be reckoned, not by hundreds of thousands, but by millions. What, then, may probably be the strategical result of this agglomeration of fighting power? "There are evidently limits," wrote that excellent soldier and critic the late Major Charles Adams, "to concentration in modern war." That is to say, we need not expect to see in individual armies colossal units. If in the old days even Napoleon was not seen at his best when directing some of his larger armies, where should one be found capable of utilizing far greater potential concentrations, now that every battalion holds wider ground? Huge concentrations, indeed, are as much a mistake nowadays, in the strategical sense, as "close order" is a mistake and a loss of power in the tactical sense. We are indeed driven by tactical exigencies in the direction of strategical dispersion. We shall see more of Bautzen in strategy, because there will be less of Borodino in tactics. The old objection to strategical dispersion is obviated when in the midst of dispersion we preserve connexion. Increased facilities for locomotion and transport, for subsisting armies from wider areas and more distant bases, for momentary communication between forces by whatever distance divided—and, lastly, the vast numbers to be utilized—all these point to the employment in coming wars of several smaller and more handy bodies in preference to mass concentrations. If the value of material and mechanical agencies in war has really, as some persons seem to imagine, increased to the detriment of the intellectual and moral, it is strange that in each succeeding campaign we find the skill and will of individuals contributing more and more to the general result. Before these days it was the insignificance of the individual, the powerlessness of small units, which it was sought to compensate by manœuvring men in dense formations. It had been observed that Providence was on the side of the big battalions. Henceforth numbers will still tell as before, and probably with greater effect, but utilized on different principles.

What strategical necessity would now appear to be imposed at the outset of a campaign, where both sides start equally strong and equally ready? Would it not be the obligation of having all prepared for sustained tactical action? Formerly, when the area was

wide and the combatants few, armies manœuvred strategically in order to close with tactical advantage; now it seems certain that armies will have to fight in order to manœuvre afterwards with strategical advantage. In other words, strategy must begin by compassing tactical successes; and the battle-ground must be cleared of smoke before a comprehensive scheme of campaign can be worked out even theoretically. Von Moltke ridicules the idea of foreseeing and providing for the working out in detail of an original plan of campaign beyond fields of battle that are not yet fought. The enemy must be consulted first. Everything, therefore, tends to show that a great campaign will in the first instance resolve itself into a succession—sharp, rapid, well-nigh continuous—of tactical strokes. A repetition of tactical strokes, with victorious issue, presupposes a strategy furnishing the means for delivering them. Unless supports are at hand, with ammunition and supplies, the value of an isolated success may be reduced to *nil*. The enemy has an unexhausted store of reserves; beaten battalions will promptly be replaced; and it is necessary, therefore, not only to deal a heavy blow, but blow upon blow. If, however, it is strategy which provides for the maintenance of tactical superiority through successive combats, it is the war administration which alone can make such strategy possible; and that, again, can only move in proportion to the public recognition of its requirements. If sufficient money is not given to the War Minister in time of peace to furnish what the entire service with one voice declares to be indispensable, if not for bare existence, yet certainly for efficient action in war, all the wit and will in the world will be powerless to organize any department which may be found wanting in time to influence the result of a quarrel. In future those who are ready to march will be in the field on the first alarm; the battles will be fought and the result sealed.

We have been reasoning on the supposition of a contest between tremendous adversaries of equal strength; but the argument is the same, though infinitely stronger, if we suppose one of them to be in collision with an antagonist distinctly inferior in resources. The Government of this country, under its present Premier, once took an interest in Belgium; another of our rulers took some interest in Turkey; the same or some other may exhibit renewed interest in Turkey, or Greece, or Armenia. But as we survey our skeleton battalions—regiments of weedy boys with non-commissioned officers lacking authority and experience; as we take stock of our meagre squadrons, our palpably inferior field guns, the absence of an organized transport train, the absence of a cavalry reserve—than which nothing can be more important and nothing so difficult to improvise—and the notorious inefficiency of our militia; as we see the military clubs overflowing with our best officers dismissed from the service in the prime of activity; as, lastly, we know that the Government either dare not, or will not, recognize the notorious truth of what is here advanced—it really savours of the ludicrous to talk about guaranteeing the independence of Belgium, or undertaking war of any sort in Europe. Let us be logical. If we desire to make our military power respected abroad, let us prepare accordingly; if not, we had better leave to those who have the power the redressing of grievances and the defence of treaties. Possibly the day may come when we shall wonder how we so completely missed the spirit of the lessons which Dame Europa's other pupils so eagerly drank in; and then, too late, we shall fling about our millions in grand style.

SCIENCE FOR BABES.

EVERYBODY is aware of the quarrel which is unceasingly waged between the defenders and the opponents of the present system of School Board education, though most people perhaps discreetly leave to those directly interested the task of watching the details of the fight. Everybody, too, knows that schools which now differ from Board Schools, not so much in the character of their education as in the fact that the unfortunate parents of the children educated are not enabled to put off the expense on somebody else, are being made the battle-grounds of a quarrel not wholly dissimilar. Shall all the 'ologies be taught? and, if they are taught, what shall give way to them? may be said to be the forms which the question under debate successively takes. Whether certain subjects have any business in primary education, rate-supported or not, is the first form put into other words. Whether it is worth while to displace Latin and Greek from their pride of place to make room for biology and physics, is the second, similarly treated. We have not seen any book which throws so much light on both questions, and on several others into the bargain, as a modest-looking manual, or rather series of manuals, published by a well-known firm of Glasgow booksellers. Messrs. Collins have commissioned the Senior Science Master of the Manchester Grammar School to prepare three twopenny books on Animal Physiology; and let us hasten to say that, given the conditions of his task, nobody can find any fault with the way in which the author has performed it. Nor, of course, is it the fault of the publishers if these little books deserve to be placed, as there is no doubt they do, in the most damnatory chapter of an *Index Expurgatorius* by every one who has a respect for childhood, for sound culture, or for the future of the human race. My Lords have settled that certain things shall be taught in certain standards, and the business of the professional person is simply to provide the means of obedience to this ukase. Let us see without further preface what the meat thus provided for English babes is. The books are said to be intended for Standard IV. and the Standards superior to it. We believe we are right in saying that a child sent to school betimes ought to reach Standard IV. by the age of eleven or thereabouts, if not earlier.

The new science has not so entirely thrown off the forms of the older matter called by the name as to despise definition. Accordingly, in p. 5 of the first volume (the one appointed for eleven-year-olds) we have a definition of man "zoologically":—

> Man is described by the zoologist as standing at the head of the animal kingdom. He is described as forming the only species in the order Bimana (two-handed animals), of the class Mammalia (suck-giving animals), of the sub-kingdom Vertebrata (backboned animals). He is further described as breathing atmospheric air by means of lungs; as possessing warm red blood, driven into circulation through his body by the action of a double heart, possessing two ventricles and two auricles; as producing living young, and nurturing them by means of milk secreted by the mammary glands; his skin more or less covered with hairs and scales; as possessing two hands and two feet, each five-fingered, the nails at their extremities flat and broad; and as possessing all his teeth even and close to one another, and his molar teeth equally enamelled.

This is pretty well; and we only hope that the eleven-year-olds will not be led by the metaphorical expression at the opening to conceive the idea of a groom standing at the head of a horse named Kingdom, and that no awkward mistakes will arise from the use of the masculine in describing the process of nurture. Youth is prone to such little errors when its brains are overdriven. But the sentence at least does not contain many words—only perhaps a score or two—which are meaningless to the learner. Further on we come to the real thing:—

> The transverse ligament of the atlas binds it to the odontoid process of the axis vertebra, so as to form a pivot joint on which the head rotates. The glenoid ligament helps to attach the humerus to the glenoid cavity of the scapula at the shoulder-joint. The ligamentum teres (round ligament) and the capsular ligament retain the thigh-bone in its socket, the acetabulum.

The emollient effect on the morals of eleven which must necessarily be produced by the learning by heart of this Abracadabra must be truly marvellous.

In the next Standard the author *majora canit*. He explains scientifically the things of common life. Youths of twelve are quite ignorant of what jumping means. He tells them:—

> Jumping or leaping is effected (1) by the sudden contraction of the muscles of the calf, by which the heels are suddenly raised and the body jerked off the ground; (2) by the simultaneous contraction of muscles which bend the thigh on the pelvis; (3) by the sudden extension of the legs by the contraction of the extensor muscles; this movement following immediately on the two movements first described.

Obviously this lucid explanation will be of little use unless (as an instructor of youth who anticipated the method observed) "he goes and does it." The joy of intelligent youth when for the first time it consciously contracts the muscles of its pelvis may possibly be a consolation for the trouble of learning. A young philosopher who can define himself as a person who nurtures his young, &c., and who knows that he jumps by contracting the muscles of his pelvis, is obviously ready for instruction in higher things still. Accordingly, in Standard VI. he plunges full into psychology:—

> Sensation is the process by which we become conscious through the brain of impressions received and transferred to it by the afferent or sensory nerves. When sensation is excited normally—that is, by external agency—it is called objective sensation. But when it arises without any external cause—that is, is produced by the unprompted or rather intrinsic action of the nervous system itself—it is termed subjective sensation, as in the case of the "ringing in the ears" sensation, with which most are more or less familiar, also in the seeing of ghosts as the result of indigestion.

Thirteen or fourteen ought (we speak under correction) to be the age of this future ploughboy or shoemaker. In half a dozen lines he knows all about it. Problems of brain and mind, life studies of Lockes and Humes, and such-like antiquated people, theories of the supernatural—there they are, all dried, cut, and crammed by hydraulic pressure into the smallest space for him. But he is not to be allowed to read this stuff and forget it. Not at all. His knowledge is to be tested by questions. "What do you mean" (this is a ten- or eleven-year-old "you") "by the osseous system, the muscular system, nervous system, digestive system, respiratory system, circulatory system, absorbent system, and glandular system?" "Describe" (the describer is perhaps twelve by this time) "the position, function, and structure of the lymphatic system, thoracic duct, lymphatics, lacteals, and mesenteric glands." "What do you mean" ("you" is thirteen or fourteen now "si Dieu lui a prêté vie," which seems in the circumstances at least doubtful) "by nerve-conductility and irritability?" "What effect have strong doses of alcohol on the brain?" This last is at least practical; and, if the infant be wise, he will reply, "They relieve it remarkably when it has been overtaxed by improper exercise." This, then, is the stuff for the teaching of which, in one rank of life, ratepayers are to pay, and children are to be kept from helping their parents and earning themselves pairs of boots; for which the access to the main keys of true culture is to be barred to those of another class, or vouchsafed to them only in miserably imperfect measure. The education of the future is apparently to consist of getting by rote a jargon which is for the most part meaningless, however carefully explained to the learner, which conveys to him no sort of really useful recreative or stimulant knowledge, which loads and wearies his brain at the time when it should be lightly burdened, and which, to crown all, could be mastered at another time and in another fashion without the slightest trouble by those

who have time and vocation for such studies. For the matter of these books, which must cost months of weary labour to children, would not take a couple of days for a well-educated—that is to say, humanistically educated—young man. All the jaw-breaking jargon is clear to him, not by means of dictionary definition, but because he is familiar with the languages from which it is derived, and, his faculties being tolerably mature, he can take in such small additional information as there is besides words and names without the least difficulty.

We need not offer any apology for having treated a serious subject, in part at least, seriously. But the comic side of these agglomerations of jargon is sufficiently obvious. The man who reads, even with a fair understanding of the subject, cannot help being reminded of the studies which delighted the later middle ages. Indignant "scientists" have talked about the barren technicalities of the Latin grammar, and the invaluable time lost in acquiring the knack of writing Greek iambics. But how poor and meagre are the technicalities even of the most technical grammar compared with the tropical forest of *argot* which holds the ground of these manuals. Half-a-dozen names of cases, a score of tenses and moods, a few syntactical terms, a modest bundle of names of feet and metres—these make up the easy yoke and light burden of *As in præsenti* and its fellows. Half-a-dozen pages of our manual will supply technicalities enough to outnumber the whole. And if we have to compare the time spent in adjusting cæsuras and avoiding cretic endings with the time spent in learning to identify and define the acetabulum and the sphenoid bone, why we shall pronounce unhesitatingly for the former. At worst some processes of mind other than mere rote memory are encouraged by it, and something like original effort is stimulated. The getting-up of our manuals suggests nothing so much, as we have already remarked, as the literary and scientific studies of the fifteenth century. We wonder what the scientists would say if My Lords authorized such subjects as the definition of an *empérière à triple couronne*, if in the Fourth Standard it became necessary to distinguish accurately between *rime batelée* and *rime à double queue*, if the grant depended on the abstinence of students from mistaking a *ballade balladante* for a *ballade fratrisée*. The one study would really have about as definite a reference both to the probable needs of the students and to the development of their mental powers as the other, and the terminology of Henri Decroy and Eustace Deschamps strikes us as intrinsically rather prettier than that of Professor Huxley and our present author. Or why not plunge youth once more into the ocean of the later formal logic? Familiarity with this is quite as useful for all practical purposes, save those of the professional physician or surgeon, as the proud capacity to identify a vaso-motor nerve with an excitor-nutrient nerve, or to distinguish them, for we can undertake to earn no grants for anybody in this particular subject. Modals, for instance, an admirable study ruthlessly cut off from modern logic; the various kinds of definition, the classification and terminology of the indirect moods—all these things surely deserve a place by the side of the investigation of the acetabulum and the processes requisite to fix upon the youthful mind ignorant of Latin the fact that when it raises its upper eyelid it does so by the aid of the levator palpebrarum superioris. We take this last expression most docilely from our author, and have no doubt that it is all right. The unregenerate Latinist might, however, suspect a false concord, for which he himself in days past would have run the risk of having unpleasant sensations conveyed by his afferent nerves to his brain from the neighbourhood of the os coccygis. The chief feeling, however, of the mere humanist is an ardent desire for the resurrection of Rabelais or Molière. This indeed, as the scientist will probably step in (like Lamb's Scotch friend) and remark, is impossible. Yet M. Jourdain learning that when he jumped he contracted the muscles of his pelvis would not be unpleasing. Nor would, we think, the library of Saint-Victor lack some pleasing additions entitled from the repertory of these our manuals for the instruction of youth. And let nobody tell us that Rabelais was a physician. He certainly was a physician; but he was not a fool.

LOCAL GOVERNMENT IN 1879.

THE Report of the Local Government Board for the year 1879–80 fully bears out what we have said from time to time about the great and growing importance of this particular department of the Government. In the hundred and fifty pages or so of which the Report itself consists nearly everything that properly belongs to a Ministry of the Interior presents itself for treatment. The Home Secretary retains the control of the police, and shares with the Lord Chancellor the responsibility for the administration of justice; but beyond this his connexion with home affairs, properly so called, is slight and accidental. With the relief of the poor, the raising and laying out of the poor rate, the guidance of local authorities, the care of the public health, and the supervision of local taxation withdrawn from its care, the Home Office can hardly claim more than a titular superiority over the Local Government Board.

Among the crowd of subjects touched on in this Report, three stand out before the rest. It was to be expected that pauperism should increase during such an exceptional year as 1879. What is really surprising is that the distress was so much confined to the strictly manufacturing districts. In the purely agricultural unions the pressure on the rates has been very little more than ordinary; it is only where the population have other trades to depend on that they have especially suffered. This is due probably to the great, though scarcely noticed, change which has come over English agricultural labour during the last ten years. Whether from emigration or more equal distribution of labour, agricultural wages have risen, and the supply of labour has been more strictly regulated by the demand for it. During the prosperous years which preceded the late depression, there was a great transfer of labour from agriculture to manufactures, and the causes which had led to that transfer were too well remembered to allow of a return movement, even when work in the manufacturing districts grew slack. Young men who had not forgotten the privations which they had left home to escape were not likely to be discouraged even by the discovery that their change of industry was not an absolute protection against distress. It remains, however, to be seen whether the continuance of agricultural depression will not work a change for the worse in the pauperism of the agricultural districts. There must be many small farmers who can only manage to work their farms at all by the exercise of the strictest possible economy, and the item in which they will be most tempted to economize is labour. If it is possible for them to do anything more by their own hands or the hands of their family, they will certainly do it. It is possible, of course, that the agricultural labourers have already been reduced to the lowest limit, and that even the necessary work cannot be got through by any less number than are now engaged in it. This is a question which the experience of the coming winter will go far to decide.

Of matters relating to public health, the most important is vaccination, and here the Report is much more encouraging when dealing with the country at large than when dealing with London. Of the whole number of children born in England and Wales, only about 4½ per cent. remain unaccounted for in the vaccination returns. The successful vaccinations during the year were 86 per cent., and 9 per cent. were returned as having died too young to be vaccinated. But in London something like 9,000 children are yearly added to the population of whose vaccination no proof is to be had; and if the majority of these are, as must be feared, really unvaccinated, such an addition does undoubtedly "constitute a serious danger, and widen the field of small-pox epidemics." The difficulty in London arises chiefly from the migratory character of the population. When a child goes on living in the house in which it was born, the registration of the birth is sufficient notice to the vaccination officer that there is a child waiting to be vaccinated. But, supposing the parents to have left the house before the vaccination officer calls, and to have given no address, there is a much greater chance of the child being left unvaccinated. A great deal of course depends on the degree of promptitude and energy which the vaccination officers bring to bear on their work, and on the amount of encouragement and supervision which the local authorities bring to bear on their officers. Thus in Lewisham, under an "exceptionally zealous" officer, "only a little more than two per cent. are left unaccounted for out of the children born"; whereas in districts in which the local authorities had allowed the vaccination officer to retain his post notwithstanding acute illness or infirm health, the returns were especially unsatisfactory. It is pleasant, no doubt, to see a local authority thus disposed to deal kindly by its sick officials; but this forbearance would be still more admirable if not exercised at the cost of the community. If it is thought well to pension off a vaccination officer, no one would grudge him the money; but the payment ought not to take the form of a permission to draw the salary of the office while omitting to do the work. There is really no difficulty in carrying out the law, except the occasional unwillingness of Boards of Guardians to do their duty. If, instead of introducing an absurd Bill to make disobedience less costly and less unpleasant, the Government had asked for additional powers of superseding such Guardians as those at Keighley and Dewsbury—the two Unions which are chiefly responsible for the bad figure which the great county of York makes in the returns—the percentage of unvaccinated children would already have been considerably reduced. What can be done when the local authority is in earnest is shown by cases like Leeds, where, out of 7,244 births registered in 1879, only 113 cases remained unaccounted for; Huddersfield, where, out of 5,266 births, there were only 57 unaccounted for; and Blackburn, where, out of 6,480 births, all were accounted for but 43. It is satisfactory to read that in no case where the lymph was supplied by Government was there any "suggestion of a resulting case of the disease which is alleged to be specially communicable by vaccination." Notwithstanding this, it is to be regretted that the prospect of an alternative supply of calf-lymph being made generally available should still be so remote; nor do the Local Government Board seem to be properly aware of the reason which makes it important that this alternative supply should be afforded. Now that it is admitted on the highest medical authority that a particular disease may be communicated by lymph taken from the human subject, it is always possible that a parent may honestly prefer exposing his child to the risk of small-pox to having it vaccinated in the ordinary way. Fortunately the objectors to vaccination are usually much more thoroughgoing in their opposition; but, if a few cases of this comparatively rational kind should present themselves, and be dealt with by law, the encouragement given to the resisting faction would be very great.

Another matter of considerable sanitary interest is the detec-

tion of adulteration. The percentage of adulterated samples was lower in 1879 than in 1878; but the improvement is only apparent. The standard of strength for spirits has been lowered by a recent Act of Parliament, and many samples that would formerly have been classed as adulterated now pass the analyst unscathed. Adulteration is most prevalent in milk, the percentage of adulterated samples being 19 over the whole country and 23 in London. Both in London and the country the proportion varies in the most unintelligible way. In Hackney 19 samples out of 46 were adulterated; in St. James's, Westminster, there was no adulteration in 67 samples; in Birmingham 37 samples out of 62 were adulterated; in Leeds only 2 out of 34. It is a significant fact that 45 per cent. of the samples procured by private purchasers were adulterated, but only 18 per cent. of the samples procured by the Inspectors. So long as the public will not take more pains about the examination of articles which they suspect to be adulterated, no effective check will be given to the practice; and it is certainly a matter for the consideration of the Local Government Board, whether the process of submitting samples for analysis ought not to be made easier and cheaper than it is. It seems certain that adulterating tradesmen have learnt how to cheat the Inspector by selling him better goods than they sell to the public, and, this being so, it is plainly to the interest of the local authorities to encourage the public to buy samples for themselves, instead of buying them through the Inspector. The one process is very much more likely to lead to detection than the other, and detection, after all, is the main end for which Parliament has thought fit to legislate on the subject.

THE MONASTIC REFECTORY.

THE Rule of St. Benedict, complete only in its moral and religious discipline, paid no attention to the architectural details of the monastery, which were left to adjust themselves to the demands of the regulations. Accordingly it may be found, by a contemporary plan of the great Abbey of St. Gall in Switzerland (edited by Professor Willis in the fifth volume of the *Archæological Institute Journal*), that by the ninth century the organization of a monastic house had arrived at so perfect an adaptation to the routine of its inmates and the occupations of the lay brethren and dependents, that a type was afforded for all future establishments of the kind. With the church as the consecrated head and centre of the buildings, the various offices were grouped in the order of their importance or convenience, the whole exhibiting so complete a combination of parts that it might be thought that the genius of a second St. Benedict had been employed to give effect by architectural expression to the exact religious economy embodied in the famous system of the founder of the Rule. The projector of some "Hygeia, or City of Health" might make a profitable study of the self-centred and self-contained monastic commonwealth of St. Gall, as shown in its educational, industrial, agricultural, domestic, and other arrangements, which were divided into thirty-three distinct blocks of building, besides interspaces for gardens and for recreation. Our own purpose is not to propose the outward form for a Utopia, nor even to describe the plan we have been speaking of, but to dwell more especially on monastic usages as illustrated by a general account of a single feature of a religious house—namely, the Refectory. As with St. Gall, which contained five hundred monks, so with later and smaller monasteries, while the dormitory with its undercroft branched immediately from the north or south end of the transept of the church, the refectory was always placed in connexion with the side of the cloisters furthest from and parallel with the nave, lest the operations of the kitchen, which adjoined the dining-hall, should interfere with religious services. In the Benedictine arrangement it ran east and west, and formed the enclosure of the cloister opposite the nave; but in the Cistercian houses it projected at right angles from the outer side of that cloister, and had its axis pointed north and south. The Carthusians, though dwelling in separate cells, had a refectory in common, placed according to the Benedictine plan, a position adopted by the Austin Canons and most other monastic orders.

The refectory of a great mediæval abbey was worthy to be compared in architectural magnificence with the banqueting hall of the baronial castle; and when we visit some old monastic dining chamber, such as that of Cleeve in Somerset, or of Worcester Cathedral, wherein the cowled brethren more than three centuries past had their last meal in sadness, and view the rows of deeply recessed and traceried windows, and the pointed roof with its contexture of woodwork relieved by rosettes and carved angels, we may think that so noble a room might have been suitable for a rich feast rather than for a meagre repast such as the founders of monastic discipline enjoined by their constitutions. But in place of the fierce revelry and barbaric festivity in which the knights of old are supposed to have indulged was the silence of the slender-dieted monks, who, instead of joining in the musical din of a minstrel gallery, listened to the lessons that were solemnly read from the pulpit. The refectory, indeed, was a kind of secondary church, for theological lectures gave almost as much character to the former as litanies to the latter. Perhaps at the present day it is not always remembered that the word "collation," as applied to a light repast, is a survival of monkish phraseology; though its proper meaning is unfulfilled unless readings from the *Collationes Patrum* or similar discourses are, according to the 42nd chapter of St. Benedict's Rule, delivered during the meal. By the 38th head it was ordered that every week a reader was to be chosen, who entered office on the Sunday, talking and whispering at the table being forbidden that he alone might be heard. If anything was wanted, signs were to be used, each brother helping another. Two dishes of cooked fare at dinner were allowed daily at all seasons of the year. Only two meals a day were allotted, and no flesh of four-footed animals was to be eaten, except by the sick and such as in every way were the weakest. The rule, however, seems to have been broken; for, by the Legatine Constitutions of Cardinal Otho, A.D. 1237, the abbots of the Benedictines in their General Chapter decreed that, according to the canon of their founder, the monks shall henceforth abstain altogether from eating flesh, except the weak and infirm; which order shows that there had been necessity for renewed legislation. The Cistercians and Clugniacs also ate no flesh, unless in case of sickness; and from the Ides of September till Easter they had but one meal a day, except on Sundays. The Templars had flesh but three times a week, having meals of esculents on other days. They ate in one common refectory, listening the while to a reader, like the more purely monastic orders. The Hospitallers, who took vows of chastity, poverty, and obedience, were dieted by rule on nothing but bread and water; but this meagre fare was improved by flesh being allowed each day except Wednesday, Friday, and Sunday, and during Lent. The punishment of altercation was seven days dining on the ground without table and cloth, and fasting Wednesday and Friday on bread and water, this fasting being prolonged to forty days in the case of one who struck another. With the Carmelites flesh was confined to the sick, which was also the rule with the Dominican friars, who, like the monks, held silence at table. The Franciscans when travelling were to eat whatever was set before them. The Carthusians on entering the refectory uncovered their heads, and, taking their seats, bowed to the Cross. Their eyes were not to wander round the apartment, lest matter for levity of conduct should be afforded; but, as directed by the "blessed Hugh of Lincoln, *Oculos in disco, manus in mensa, aures ad lectionem, cor ad Deum habere debemus.* No *pitancia* was to be touched until he who had placed it had returned to his seat. In drinking, the cup was to be held with both hands. No one was allowed to speak in the refectory, cloister, or the church. The Carthusians remained the most uncorrupted and incorruptible of all the monastic fraternities; but they nevertheless suffered the most of any at the Dissolution. They no more broke their rule of seasonable silence to the last than their allegiance to the Court of Rome, which was hardly the case with the Benedictines. In the regulations of the provincial Chapter of the latter, A.D. 1343, it was complained (cap. ix.) that the monks, from being allowed to speak English freely during dinner-time, became too talkative, and that when abroad they showed themselves shamefully ignorant of the Latin and French tongues. It was therefore decreed that during their meals they should address one another only in French and Latin, under penalty of deprivation of meat for two days. If they murmured at any decision of the Chapter, they were that day and the following to fast upon bread and water. If a monk insolently complained to any of his brethren against the ruling of the Chapter upon any point, he was, upon being declared guilty, to be flogged three days in the Chapter, and hold the lowest place in the choir and elsewhere during a month. If he repeated the offence, "let him for six successive days eat bread and water, sitting upon the ground with a single mess of pottage (*uno pulmento*), and for three successive days let him be publicly flogged in the Chapter-room." Incorrigible monks were to be sent to another convent, bearing a letter telling their delinquencies, and there they were to be supplied with food to the value of twopence a day.

The Benedictine repast at collation, which was the evening refection, was at first a draught of wine mingled with water, but afterwards bread or dried fruit was allowed to be added. Extra cups of wine, called *caritates* or charities, were given while the collation was being read, on festivals and anniversaries to commemorate benefactors. In analogy to this practice Pope Boniface the Saint is said to have instituted indulgences for those who should drink a cup after grace, since called St. Boniface's or the Grace Cup. It may be hence inferred that the round and shining British host of the "Sun" must look to the Church for his appellative of Boniface. One Anglo-Saxon Grace was to sign the dishes with a cross; and by the 39th Rule of St. Fulgentius, each monk, upon taking the first bread and first draught of drink, said *Benedicite* to his companions, who answered *Deus.* We cannot tell whether symbolism was carried so far as Mr. Browning suggests in his *Soliloquy in a Spanish Cloister*, where Brother Lawrence's brother and ill-wisher complains of the former:—

> When he finishes refection,
> Knife and fork he never lays
> Crosswise to my recollection,
> As I do in Jesu's praise.
> I the Trinity illustrate,
> Drinking watered orange pulp;
> In three sips the Arian frustrate,
> While he drains his at one gulp.

Though St. Benedict may have had no clear foresight

> Of happy convents bosomed deep in vines,
> Where slumbered abbots, purple as their wines,

he might fairly have deduced from his own Rule the likelihood that not only wine which maketh glad the heart would not fail in

copious measure to cheer the severity of his followers' discipline, but that solid luxuries would gradually fill their tables. His Rule was not grounded on abstemious principles as regards wine, and wine itself would introduce the rest. The 40th Chapter, *De Mensura Potus*, while suggesting that one pint or even less of wine a day to each monk might be sufficient, yet added that, if on account of the nature of the place of their abode, or their labours in summer's heat, or, in fact, for any other reason, they stood in need of a larger cup, the abbot should have power to grant it. We read in the Book of Esdras that, next to woman and truth, wine is strongest, for it overcomes the king. It was too strong even for St. Benedict's control, for although he allowed that wine ought not to be the drink of monks, yet, since the monks of his day could not be taught this, "let us at least agree not to drink our fill of it, but sparingly, for wine 'maketh even the wise to fall away.'" So gentle a caution would be but gently observed, and as there appears to have been no lack in the supply of the rich liquor, so there would be no shrinking from its indulgence.

Whether in England the growth of the vine was ever so luxuriant as to supply in a considerable degree the home wine-press, was the subject of a learned discussion between the Rev. Mr. Pegge and the Hon. Daines Barrington in the 1st and 3rd vols. of the *Archæologia*. An old Latin verse affirms that London was not more famous for ships than Winton for "Bacchus," and Lambarde the Kentish antiquary tells us that when Edward II. in his 19th year was at Bockinfold, Haymo de Hethe, Bishop of Rochester, sent him thither "a present of his drinkes, and withal both wine and grapes of his own growth in his vineyard at Halley." The Abbess of Malling had also a vineyard at Halley, the Bishops of Rochester receiving from her a boar and a quantity of wax *pro decimis vinearum de Hallynges*. If we may believe the old chroniclers, the English abbeys were really "bosomed deep in vines," and the Isle of Ely, Dunstaple, St. Edmundsbury, and Canterbury are specially noted for their vineyards. Mr. Pegge argues that vine culture was first introduced into England soon after A.D. 280 by the Romans, and that it declined when better wine could be had cheaper from our French provinces. The best wine, however, was always imported, and the many royal donations of that liquor mentioned in the State records to have been presented to religious houses were certainly not of home fermentation. As an instance of these benefactions, it happens that the earliest autograph extant of an English sovereign is the signature appended to a letter of Richard II., dated from Bristol Castle (1386), requiring Micheal de la Pole, the royal Chancellor, to send annually at the "Feast of Nowel" a tun of the red wine of Gascony to the Prioress of St. Mary Magdalen, Bristol. The same sovereign also gave a hogshead of wine yearly to the monks of Hinton Charter House, near Bath. The abbots at times, indeed, seem to have had enough of wine and to spare, Thomas Pennant, Abbot of Basinwerk, among such instances, being said by the historian of the same name and of the same family to have given twice the treasure of a king in wine, which seems rather incredible. The quality, we are led to believe, was as good as the supply, and the wine of pontifical entertainments, which we are taught by Horace to have been only inferior to the wasteful heir's Cæcubian, was perhaps not more potent than the "theological wine" of the mediæval abbot's board. In keeping with its excellence were the accompaniments, and it will be found on inquiry that the original crudity of the monastic refection was only the germ of an elaborate system of good living. We are not sure that the monks first introduced into our language the word "gastronomy"; but there may be less hesitation in affirming that the illustrious science of that name owes no little to their devotion to its culture. Situated as were many of the abbeys in a rich landscape abounding with the abbot's own flocks and herds, and on the borders of a teeming fishing stream, it might be expected that the monks, who were laymen and not priests, would find some agreeable employment in the preparation of things fit to be eaten. The science of cookery was of course one of gradual improvement, and it is curious to contrast the simplicity of the fare allowed by St. Benedict with the exquisite dishes laid before the later abbots, where each course was furnished with a "subtilty," which was an allegorical device in confectionery. Of the luxurious living of certain monastics, Giraldus tells a malicious story. It happened on a time, that when Henry II. was returning from hunting he was met at Guildford by the prior and thirteen monks of St. Swithin, Winton, who with gruesome faces and tearful eyes prostrated themselves in a miry place, complaining to the King that Richard their bishop, who succeeded Henry of bountiful memory, had withdrawn from them three dishes, of which they had been accustomed to partake to support them for their religious exercises. When the King inquired how many dishes remained to them, they replied, "only ten," but that they were wont to have thirteen on feast days since the time of St. Swithin. When the King heard this he called his nobles around him. "See," he said, "these monks, I thought, *per oculos Dei*, their house with all their abbey had been consumed by fire, or that some grievous and terrible loss had happened to them, who rolled themselves in this miry place. But now they accuse their bishop of keeping back three dishes out of thirteen. May their bishop perish unless he reduces their dishes to the number of mine, who am called king, and am content with three." The author of the *Speculum Ecclesiæ*, in which we find the foregoing anecdote, has many bitter things to say against the monks, whose original humility and austerity, he argues, had gradually given way to pride and luxury. There is much to confirm his representation. We cannot encumber our columns with specimens of a monastic *menu* of the advanced type in proof of their high living, or we might perhaps show that even a Greenwich host of the present day need not be ashamed to model his whitebait dinner after the form of a great mediæval abbot's feast. Even after the overthrow of the abbeys, so excessive became the luxuries at churchmen's tables, that one of the reforms of the Reformation was the limitation of their dishes. Archbishop Cranmer, at a Convocation in 1541, procured an ordinance that the archbishop should never exceed "six divers kyndes of fleshe, or six of fishe on the fishe dayes, the Bishop not to excede five, the Deane and Archdeacon not above four, and all other under that degree not above three." The order concludes with a memorandum that the decree for a moderated fare "was kept for two or three months, tyll by the disusing of certaine wilfull persons it came to the old excess."

RACING YACHTS.

THE usual annual summary of the yacht-racing of the year was published in the *Field* of Saturday last. In it are given, according to custom, the names of all the yachts that started throughout the season, the tonnage of each, the names of the builders, the number of prizes won by each vessel and their worth, the list of the latter being subdivided so as to distinguish first from second or other prizes. Of the value of this summary to all who are interested in yacht-racing it is unnecessary to speak, and we doubt not that its accuracy can be relied on. The alphabetical arrangement, it is true, is by no means perfect, the compiler having apparently attended to the initial letters only; but there is no practical difficulty in finding any name that is wanted, and it may fairly be assumed that the figures are given with the exactness which has usually marked the treatment of all subjects connected with yachting in the *Field*. The results which are thus tabulated have more interest this year than summaries of yacht-racing have possessed for some time past. Two new vessels, presenting some striking novelties in construction, made their first appearances this season; and the famous yawl which for so long a period has held her own against all comers came forth to sail with her ballast re-arranged according to the latest ideas, and with an increased spread of canvas, and soon showed that the old proverb about letting well alone did not apply in her case. The *Miranda*, better handled perhaps than she has ever been before, was fearlessly raced against cutters and yawls with results which, as shown by the tabular statement, cannot but be extremely encouraging to those who love the schooner rig.

Of the two cutters that have been mentioned, the steel *Vanduara*, which was at work much earlier than her rival, attracted at first an amount of public attention which is rarely bestowed on racing vessels, and was the subject of a great deal of very foolish writing both by ignorant people and by those who ought to have known better. She was absurdly called the champion yacht, and was spoken of as if nothing afloat could compare with her, and as if her design showed a great stride in naval architecture. It need hardly now be said that this was ridiculous. The *Vanduara* was—at the beginning of the season at all events—a very admirable racing yacht; but there can be no doubt that she had in the early contests great good luck. She was at first opposed to the *Formosa*, and naturally gained no small *éclat* from beating very thoroughly what was supposed to be a good racing vessel. It was not then known that the *Formosa* had completely lost such powers of sailing as she once possessed, and the victories of the new cutter over her naturally seemed considerable achievements, whereas they really were but very easy victories. After these contests she for a time sailed very well, and had rare good fortune. Her two greatest successes were undoubtedly those which she achieved in the race from Ostend to Dover, when, in beating dead to windward against a strong breeze and a heavy sea, she put all the other craft well under her lee, and again in the race from Dover to Cowes, when, under very similar conditions, she vanquished over a long course the *Latona* and *Egeria*, two admirable vessels, both of which, as we need scarcely say, are much larger than she is. At this time, however, she had not been invariably successful, as she was absurdly said to have been, having been beaten in Channel matches for all rigs by the *Miranda* and *Latona*, and after the Cowes race her star seemed gradually to pale. In the Northern waters she was defeated by the *Samæna*, a vessel built in the old-fashioned way of wood, but ballasted according to the most modern ideas with a huge lead keel, and this defeat proved to be the forerunner of many others. In a long series of contests the wooden cutter, though not always victorious, had, on the whole, decidedly the best of it. Her steel rival had some successes in the matches which intervened between the Northern regattas and those of the Solent, but in the latter the *Vanduara* was most unlucky, and achieved very little. She departed before the Albert Club matches, winding up her season's racing by a singularly ignoble victory at Milford Haven, where she defeated two small local craft. The yachting world is at least as full of gossip as any other section of the community, and the rather brusque retirement of the *Vanduara*, coupled with her bad luck latterly, led to stories of her having been injured by the work she had gone through. In all probability these were utterly untrue. Racing had, to some extent, told on the vessel, as any one who looked at her topsides could see; but it would be very hasty

to assume that her sailing powers were seriously affected. Her sailing next season will doubtless excite more interest than usually belongs to yacht races, as it may be possible to gain from it considerable knowledge respecting the fitness of mild steel for small sailing vessels. Considerable doubt is now felt as to its being a suitable material for such craft; and at present certainly the evidence, so far as yachts are concerned, is very strongly in favour of wood. In one respect, no doubt, the *Vanduara* surpassed all her rivals this season. The *Field* shows that the total value of her prizes is larger than the value of those gained by any other yacht; but this does not in her case prove superiority to all her competitors. It appears from the figures given in the *Field*—the correctness of which we assume, although they differ from other figures which have been given respecting this yacht—that she started thirty-one times and gained fourteen first and three second or third prizes. In the proportion of prizes to starts she is surpassed by three wooden vessels—the *Florinda*, the *Miranda*, and the *Samœna*.

The last-named certainly achieved very remarkable success in her first season, and, judging merely from results, must be placed above her Northern rival. The statistics in the *Field* show that she started twenty-five times, and gained thirteen first and four other prizes. Her designer and her builder have good reason to be proud of her, and it may be said with regard to her that she appears to be admirable in every point of sailing except beating to windward. Unfortunately this is just the point on which a cutter is expected to excel. The *Vanduara* does very greatly excel in beating to windward, and, despite the victories of the *Samœna*, there can, we think, be little doubt that, whenever the two have to make a long beat against a strong breeze and a heavy sea, the wooden cutter will be vanquished by the steel one, unless indeed the latter has really suffered from this season's racing. It is, then, not easy to say absolutely which can rightly be considered the better vessel. At present the *Samœna* has achieved most, but then she had great good luck, while the *Vanduara* latterly had very bad luck. Perhaps next season will see a very different result. It must not, however, be forgotten that the *Vanduara* requires constant docking, which of course her rival does not, and this is no small drawback to the merits of a racing yacht.

Besides these two vessels, another first-class yacht made her first appearance in the summer of 1880. This was the *Waterwitch*, a schooner of 157 tons, which took part in three matches, and is credited with having gained one first prize. This was the prize for the Royal Yacht Squadron schooner match, which was very carelessly managed and very doubtfully timed. In it one famous vessel sailed concerning which some sad facts are revealed by the pitiless statistics of the *Field*. The *Egeria*, it seems, started eleven times, but took no first prize. Her gains were four second or third prizes, of the total value of 130*l*. This schooner, however, is now fifteen years old, and that for a racing yacht is a considerable age. Other vessels, younger than she is, but still well past their youth as racers, seemed to be sailing better than ever last season. As has been said, the *Florinda's* achievements were considerably above those of the *Vanduara*, and, even when allowance is made for the fact that the yacht which is raced very often may probably have a diminished proportion of success as compared with one which is not raced so much, she must still be held to have done better than the greatly-praised Scotch cutter. She started, it seems, eighteen times, and took ten first and three other prizes, the total value of her gains being 765*l*. As has been mentioned, she was altered during the winter, more lead being put on her keel and in her garboards, and her counter lengthened so as to enable her to carry more canvas. It required some boldness to alter anything in a yacht which had always done so well; but boldness has been amply justified by results. Never has the *Florinda* sailed more brilliantly than she did in some matches in the latter part of the season. Her most noteworthy feat was on the first day of the Albert Club races, when, in a long close-hauled stretch, she sailed away from her competitors, all of them excellent vessels, as easily as if they had been so many ponderous cruisers. On other occasions she added to her well-earned fame, and at Torquay she wound up the season's racing by taking two first prizes, one of which, however, was nearly snatched from her grasp by the *Miranda*.

The latter vessel, indeed, proved herself well worthy to struggle with the best yawl that has yet been built, and did much to justify the terror with which she has inspired the owners of other schooners. According to the *Field* she started twenty-one times, and took nine first and five second or third prizes, of the total value of 800*l*., and when it is remembered that most of them were gained in matches for all rigs, in which the best cutters and yawls took part, it will be seen how grandly the schooner must have sailed. In the beginning of the season she had, no doubt, some good fortune; but, on the other hand, she had bad luck in the latter part of the summer. Her best performances were in the beat along the back of the Goodwins in the Nore and Dover match, when she held her own with the *Latona*, and in the run from Dover to Ostend, when she led the fleet over the whole course. So far as we are aware, the *Miranda* has not been in any way altered since she was launched, and it is not a little curious to find her in her fourth season racing even better than she has ever done before. It is to be observed that, under a new captain who had previously given good proof of his skill in cutters, she was handled almost to perfection.

Of only one other first-class yacht, the *Latona*, is a favourable story told by the stern figures of the *Field*. She was not so successful as the *Florinda* and *Miranda*, having for twenty-eight starts eleven first and three other prizes, of the value of 885*l*. Of these, however, two were Queen's Cups, which, as we need hardly say, are desired beyond all other trophies by yacht owners. Throughout the season the *Latona*, commanded by the excellent seaman who was formerly in charge of the *Vol-au-Vent*, sailed admirably, and at Plymouth she saved her time well in two successive races on the *Florinda*, and again at Cowes and Weymouth she was successful against that most redoubtable antagonist. These victories, however, were very fully avenged; and we believe that, in fine weather, the chance of the smaller vessel will generally be the better one. If, however, second to the improved *Florinda*, the *Latona* is second to her only, for, judging from her performances this season and last, we believe that she may be fairly considered the best vessel of the rig afloat after the Gosport yawl. This would clearly appear to be the opinion of other yawl owners, who seem to have as much dread of these two vessels as the schooner owners have of the solitary *Miranda*.

Want of space prevents us from speaking of the winnings of the smaller yachts, which are duly set forth in the columns of the *Field*. It is impossible, however, to leave unmentioned the remarkable achievements of the *Norman*. This 40-ton cutter won 810*l*., gaining sixteen first and four other prizes. She was, we believe, like the *Florinda*, re-ballasted during the winter; and thus in two instances it has been found possible to improve admirable yachts by adopting the latest system of ballasting. This fact, combined with the success of the *Samœna* and *Vanduara*, one of which carries a great mass of lead on her keel, and the other a great mass in her keel, certainly shows how effective the present plan is, and, despite very considerable drawbacks, it will probably before long be adopted for all racing yachts. Perhaps the season of 1880 will be memorable as having been the time when the necessity for this change became apparent. It will certainly be remembered as having witnessed the first contests of two very fine cutters and the splendid sailing of older craft. Possibly also it will be remembered for other less pleasant features of which we propose to speak at a future time.

THE RAILWAY SYSTEMS OF THE WORLD.

THE French Ministry of Public Works has issued a very handsome volume, the *Album of Graphic Statistics*, which is full of curious and valuable information. The greater part of it has exclusive reference to the railways, roads, and waterways of France, and, though of great value to the economist, the statesman, the engineer, the railway manager, the investor, and the speculator, is hardly to the taste of the general reader. But there is one part which has an interest for all educated and thoughtful men. It consists of a graphic presentation of the progress and extension of railways in Europe, the United States, Canada, India, and Algeria. As the information which it contains is rare, instructive, and suggestive, we propose to reproduce some of it for the benefit of our readers.

Beginning exactly half a century ago, we find that the total length of the railways of Europe was barely 316 kilomètres, of which 279 were in England and 37 in France. We make no apology for using kilomètres instead of miles, for little or nothing turns upon the absolute length of the lines. What is of interest is the relative length, and that is shown by one measure as well as by another. We may state, however, for the benefit of any one curious enough to work out the calculations for himself, that the kilomètre is roughly three-fifths of a mile, or exactly ·621. In 1830 there were also 65 kilomètres of railways in the United States. It will be in the recollection of many of our readers that the first English railway, the Darlington and Stockton, was made in 1825, and from the above figures it will be seen that in the following five years no other countries except France and the United States availed themselves of the new invention. Moreover, both of them together had considerably less than half the mileage of England. It was with railways as it has been with steamers, with the substitution of iron for wood in naval construction, and, in short, with nearly every great mechanical invention; England was not only the first to adopt the innovation, but she distanced all competitors by the promptitude with which she carried into practice the new idea, and consequently she has preserved her foremost place in the industrial race. Passing over twenty years, we see this more clearly. In 1850 there were in Europe 23,083 kilomètres, of which 10,656 were in the United Kingdom; Germany came next with 5,822 kilomètres; and France third with no more than 3,080. In other words, the United Kingdom, which is but a mere speck in comparison with the Continent, had in the first quarter of a century of railway construction built over 46 per cent. of the whole European system. Germany, though nearly twice the size of the United Kingdom, had only half its length of railways, but in the twenty years she had passed France, which had less than one-third of our own mileage. The United States, on the contrary, had 14,433 kilomètres—absolutely a greater length than the United Kingdom, but relatively very much smaller.

Passing over another twenty years, we find Europe in 1870 with 104,120 kilomètres of railway, of which 24,999 were in the United Kingdom, or a little under one-fourth of the whole. Germany had in the interval laboured hard to develop her communications, and possessed 18,560 kilomètres. But France had

exerted herself still more, and had nearly overtaken her neighbour and political antagonist, having 17,924 kilomètres. The three countries between them had constructed three-fifths of the whole European mileage. As regards our own country, we had practically completed our network some time before 1870. We have since been adding small branches and opening up remote districts, more particularly in Ireland, Scotland, and Wales; but the main communications were then finished. The Continent, on the contrary, was little more than beginning; and even the foremost countries, Germany and France, were only in the middle of the work. The United States were still more backward, though they had achieved much, having in 1876 constructed 84,637 kilomètres, or about four-fifths of the mileage of Europe. Coming, in the last place, to 1878, we find Europe with 158,157 kilomètres, being an increase of 50 per cent. in the eight years, which confirms what we have just said—that in 1870 Europe generally was little more than beginning railway construction. In still further proof of this, we no longer find the United Kingdom ahead of the Continental countries. It had in fact added little more than 2,500 kilomètres in the interval to its system, which in 1878 consisted of 27,552 kilomètres. Germany had now the greatest length of lines in Europe, or 31,556 kilomètres. France had only 24,424 kilomètres. Russia was a close fourth, with 22,670 kilomètres. These figures bring out very clearly under another aspect the military unreadiness of France in 1870. Although so much richer than Germany, she had not, like her, perfected her communications any more than she had in other respects turned to account her resources in men and money. After all that has been said of the influence of the French Empire in promoting industry, it failed even in railway building to overtake Germany, so vastly poorer and split up into petty and mutually jealous States. With these facts before us we can better appreciate M. de Freycinet's railway policy. Of all the countries in Europe, those which have most extended their networks in the last eight years are Sweden and Austria-Hungary. Sweden in 1870 had but 1,723 kilomètres, in 1878 she had 4,563; in 1870 Austria-Hungary had 9,401 kilomètres, and in 1878 she had 18,391, or almost twice as many. In 1878 the United States had 131,682 kilomètres.

Turning from the history of railway construction to its results, we find that, in proportion to its population, Sweden is the best provided with railways of any country in Europe. For every 10,000 inhabitants she has 10·3 kilomètres; then come Switzerland, the United Kingdom, Denmark, Belgium, Germany, and France; Greece being last of all, and Turkey but just before her. For the whole of Europe the mean is 5·3 kilomètres for every 10,000 inhabitants, and the seven countries just enumerated, ending with France, have more than this mean; Holland, however, has only 5·1, and all the other countries of the Continent have less. Outside of Europe, the United States have 39·9 kilomètres per 10,000 inhabitants, or over six times the European mean; Canada has 26·7 kilomètres, Algeria only 2·4, and India no more than 0·5. But we need hardly say that this comparison with population is entirely delusive. The United States, for example, and all new communities, make railways for the express purpose of attracting population by opening up new regions in which immigrants may settle, thus reversing the ordinary European notion that railways should attend upon traffic, not go before it. In the case of such countries as Sweden and Switzerland, again, population is sparse, the industrial centres being separated by wastes. If, however, we compare the length of lines, not with the population, but with the area of each country, we find the order of precedence very different. For every 100 square kilomètres of surface, Belgium has 13·5 kilomètres of railway; the United Kingdom, 8·7; Switzerland, 6; Germany, 5·8; Holland, 5·5; France, 4·6; and both Austria-Hungary and Italy, 2·7; Denmark, Sweden, and Roumania rank together with 1·0; while Russia and Turkey follow with 0·5. The mean for Europe is 1·7. Of the countries outside Europe, the United States have exactly the European mean, India, 0·3; Algeria, 0·2; and Canada, 0·1. It will be seen that whereas, relatively to population, Belgium ranks only fifth in Europe, relatively to area she stands first; and that the United Kingdom is third in respect to population, and second in respect to area. We have here again proof that the United Kingdom is practically fully supplied with railways. Belgium is the most thickly populated country in Europe, and the most completely intersected by lines. Extensive tracts of the United Kingdom, on the contrary—the Highlands and islands of Scotland, Wales, and a large part of Ireland—are thinly populated, have few towns of any importance, and, the two former particularly, are ill adapted to railways. Yet the United Kingdom ranks next to Belgium in regard to area. The high rank of Switzerland, in spite of its mountains, is very noteworthy. But, relatively to area, Sweden stands very low, though she heads the list when the comparison is with population. The low rank of Russia, too, is remarkable, great as has been the extension of railways there since the Crimean war.

The foregoing figures and comparisons cannot fail to suggest to the reader that, vast as undoubtedly has been the expenditure of capital and labour upon railway construction, the progress yet made is really very moderate. During the late depression in trade it was argued by the eminent French political economist, M. Leroy-Beaulieu, that the fundamental cause of the distress from which all commercial communities were suffering was the practical completion of railway construction and of the other transformations of industrial equipment rendered necessary by the mechanical inventions of the century. We pointed out at the time the baselessness of that theory, and in the figures we have been citing we have abundant proof of the justness of our criticism. Take, for example, the United States. Population there is growing as rapidly as it has done at any time in the past, and wealth is accumulating even more rapidly than heretofore, while American credit stands far higher now than it has ever hitherto done. So far, therefore, as capital and labour are concerned, the United States have ample means of continuing railway construction; and, with the growth of population and traffic, they have the motive for doing so. But, relatively to the area of the country, we see that the existing system of the United States is only one-fifth as large as that of the United Kingdom. In other words, if the United States are to have as large a mileage for their extent of territory as the United Kingdom has now, the 131,000 kilomètres existing at present must be increased to 655,000. In Canada, Algeria, and India the addition must be on a still larger scale. And then we have to include in our review Mexico and the vast countries of South America, Australasia, South Africa, Turkey in Asia, Persia, Afghanistan, and Central Asia, China, Japan, the Malay Peninsula and Archipelago, Arabia, Egypt, and the whole interior of Africa. No doubt many years must elapse before several of these immense and savage regions will be opened up by railways. But we are not now concerned with the *when*. The point we wish to insist upon is that, so far from being nearly completed, the construction of railways has little more than begun. All new communities, as we have shown in the case of the United States, and as we might easily show in those of Mexico, South America, and Australia, have need of immediate and vast additions to their networks. The same is true of most European countries. Granting that for her present economic development Germany is nearly equipped, France has still scarcely more than half the British mileage relatively to her area, and she is rich enough to provide herself fully. Austria-Hungary and Italy have but half the French allowance, and a quarter of the British, while Russia is as badly provided as Turkey. Just now the bad credit of Russia prevents her from pushing on her railways as rapidly as her Government would wish; but the distress of her population, deepening into famine, is a new stimulus to extension. Lastly, in Turkey itself we may expect to see an extensive construction of railways, if peace is preserved and some kind of order established, the Austrian Government being intent upon the completion of communication with the least possible delay between Vienna and Constantinople and Vienna and Salonica. There is, then, little reason to doubt that, if peace is maintained, railway construction will shortly take a fresh start of activity, and once more give rise to a brisk demand for iron and steel.

THE THEATRES.

THE new Princess's Theatre, handsomely decorated and arranged in the face of some architectural difficulties so as to secure unusual comfort and accommodation both for audience and actors, was opened a week ago with the first of a series of performances in which the chief figure is to be Mr. Edwin Booth, an American actor of great and well-deserved reputation. Mr. Booth's first appearance has been in the part of Hamlet, and in undertaking this part he had two forces to contend against, that of his own celebrity in America, which preceded his introduction (for so it may fairly be called, although he has before appeared in England) to the English stage, and that of the striking and lasting impression produced by the performance in the same part of the distinguished actor-manager, whose Hamlet was a surprise to those who only knew him before as a melodramatic and "character" actor of mark. It may be said at once that the result justifies Mr. Booth in choosing for his first part one in which he had what an American paper has called "the Irving canon" to contend against. Hamlet is a part capable of an infinite number of interpretations, and a part so various in its emotions that it is a stage tradition that absolute failure in it is next door to impossible. A strange missing of the possible or desirable effect may be observed in one scene; and it may be atoned for by the seizing of an entirely different effect in the next. But, if complete failure is difficult to attain in the part, complete success—that kind of success which draws the town—is at least equally difficult, and the names of the players who in the last twenty years have attained this sort of success are easily numbered. It would be beside the question to speculate on the chances of Mr. Booth's Hamlet having this effect, since he has wisely determined to vary his parts during his limited stay in London; and it would, to our thinking, be equally out of place to make comparisons between his interpretation and that of other actors, English or foreign, who have more or less lately played the part of the Prince of Denmark in London. We propose, then, to give as accurate an account as we can of the impression made on us by Mr. Booth's performance without reference to any other standard.

Mr. Booth is markedly graceful, markedly perfect in elocution, and both markedly and nicely courteous in demeanour throughout the play. The fault which has been patent to most of his critics, that of want of passion, exists to some extent, but has, at any rate, been exaggerated, possibly through misunderstanding of his purpose, possibly through the nervousness which generally affects even the most practised actors on a first night in a new

theatre, and possibly in many cases through a combination of both causes. His acting in the earlier scenes of the play does no doubt seem somewhat dull and formal; and here, as throughout the play, he was apt to spoil the fine effect of certain passages by his adherence to the old trick of "taking the stage" at the end of speeches which are finished off with what the old school of acting considered "a point." But as the play goes on Mr. Booth seems to warm to new life and perception. The fault just referred to is always more or less present, but becomes less accented as the actor finds occasion for showing that his coldness in certain passages is deliberate, and not the result of an incapacity to give a passionate interpretation to passionate words. Deliberateness is, it may be said, one striking feature of the American actor's Hamlet. His conception seems to be that, after the terrible interview with his father's spirit, Hamlet is overmastered, even in the scene with Ophelia, by one thought, which gives him no rest, and which shadows his life with darkness. Yet he is not deficient in the passages of comedy which relieve this idea of the character. Into his talk with Polonius he infuses an always fine and courteous touch of comedy; and in his dialogue with the players he combines with a fine manner a sense of the freedom which he can bestow on the actors, but does not show to his uncle-father's courtiers. The somewhat sombre tone of Mr. Booth's conception of the character is marked strongly, and to a certain extent unfortunately, in his scene with Osric; but it conveys exactly the impression which the actor seems to us to desire, and is consistent with the feeling of the preceding and of the last scene. In the first part of the play Mr. Booth's performance is, as we have already hinted, somewhat dull and ineffective; and perhaps the first sign that his representation is well worth studying is found in his talk with Horatio, Marcellus, and Bernardo when they tell him of the appearance of the Ghost. Here there was much nature in his acting, but its good effect was injured by the habit we have already referred to, of "taking the stage." In both scenes with the Ghost his acting appeared to us to be for the most part nothing better than scholarlike, but was redeemed by one fine touch. After he has broken away from the detaining hands of his companions, he rushes after the Ghost, and then suddenly bethinking him that it may be a devil, raises the cross-hilt of his sword in front of him, and makes his exit with this talisman against evil influence held constantly before him. In the following scene Mr. Booth seemed to us to miss entirely the notion of extravagant excitement which the words suggest; but he delivered them, as always, with admirable elocution and finished emphasis. Of the fine comedy of the scene with Polonius we have already spoken, and that which follows it, with Guildenstern and Rosencrantz, leading up to the interview with the players, wants nothing in perception and courtesy, but seems to miss oddly and disappointingly the force of the great speech beginning, "I will tell you why; so shall my anticipation prevent your discovery, and your secrecy to the King and Queen moult no feather." On the other hand, but for the two ridiculous readings which Mr. Booth introduces in two well-known lines, the following scene or scenes seem to us full of thought and merit. In the well-known passage "About, my brain! I have heard that guilty creatures sitting at a play," &c., Mr. Booth's interpretation appears to us to be as well founded as it is well executed. To his Hamlet the idea is not at that moment new; it has been in his mind ever since the arrival of the players, and the excitement of the previous speech has diverted him from the consideration of a plan which he has deliberately formed, and to which he now gives so much of his attention as to make Ophelia's relations to him a mere accident in the purpose of his life. This feeling is, as it seems to us, brought out in the strangely restless and graceful acting in the short and celebrated scene with Ophelia. As to the play scene, we may note first that Mr. Booth's Hamlet addresses the words, "Begin, murderer! Leave thy damnable faces, and begin," to the player-king alone, thus suggesting that the Prince is urging the actor whom he himself has trained to come straight to the business in hand, and we may then observe that throughout the scene the actor's rendering is singularly unobtrusive and singularly forcible. Mr. Booth's Hamlet waits, controlling his emotions through the play, and watches for the discomfiture and the exit of the King, and upon that his passion bursts out for a moment, after which, overcome by the reaction, he falls upon Horatio's neck. In this Mr. Booth's "business" is identical with that of Herr Dettmer, the distinguished German actor whose death we regretted to record last week. This is one of the comparatively few bursts of unrestrained passion which Mr. Booth allows to his Hamlet, and its force accentuates the somewhat cold dignity of the following scene with the recorders. At the very beginning of this Mr. Booth is passionate enough, but he seems to think the Prince should subdue his passion entirely in the presence of the two wretched creatures who come as messengers to him. His idea that Hamlet himself knows how to play the recorder is ingenious and appropriate enough, and his rendering of the speech relating to it is full of dignity, if, as we have suggested, wanting in the passion of other readings. To Polonius, as in the previous scene, he is contempt and courtesy combined; and if in the scene with the Queen he seems sometimes too measured, his burst of fire at "Nay, I know not: is it the King?" might redeem a greater amount of coldness than Mr. Booth puts into the scene. In the penultimate scenes with the Gravedigger, with Laertes, and with Osric, he preserves admirably the sense of fatefulness, which seems to us, from having seen his performance once, to be the keynote to his interpretation of the character. At the end of the last scene he gives one of the rare and valuable bursts of passion to which we have referred to before.

To sum up, Mr. Booth is, judged by his performance in *Hamlet*, a thoroughly well-graced actor. He has thought, poetic perception, and complete skill in execution. His gesture and elocution are indeed admirable, and his marked but slight American intonation gave a not unpleasing individuality to his performance. The effect of his acting is marred by the odd and old-fashioned trick of "taking the stage," to which we have before referred, and perhaps it cannot be expected that Mr. Booth will give up a habit which has presumably become a part of his method, although it might serve his immediate purpose to do so. Whatever Mr. Booth's faults may be, his performance of Hamlet is fine and interesting, and leads us to look forward with agreeable anticipation to his promised performance of other and widely different parts.

The stage management, except with regard to the Ghost scene, is both nice and effective; and we may call special attention, among other clever points, to the fact that Yorick's skull is turned up from the gravediggers' researches still clothed with the fool's cap which serves to identify it. We might dwell upon other instances of Mr. Booth's care in matters of this kind; but we have perhaps said enough to indicate our impression that Mr. Booth is an actor and stage manager of decided mark. The players who fill the other parts in the piece are already more or less familiar in their respective parts to London audiences. Mr. Leathes's Laertes and Mr. Swinbourne's King were seen not long ago at the Lyceum. Mrs. Hermann Vezin's Gertrude is in welcome contrast to most ordinary interpretations of the part. Mr. Leathes's well-known performance adds, as on many former occasions, to the effect of the last scene. In this Mr. Booth's grace and decision of gesture are especially remarkable. His fencing belongs to an exploded school; but the gross anachronism of introducing fencing of any kind into the play of *Hamlet* is more than enough excuse for Mr. Booth's return to an old-fashioned method, out of which he gets the most plausible interpretation of the impossible "scuffle" which we have ever seen. Miss Gerard's Ophelia is a performance of some promise.

The curious vitality of that odd play *The Lady of Lyons* has been brought into marked relief by the representation now given at the Sadler's Wells Theatre under Mrs. Bateman. Miss Isabel Bateman plays Pauline, Mr. Charles Warner plays Melnotte. Miss Bateman has steadily improved in her art during the last few months. Her conception of the part which she is now rendering seems to us capital, and her execution fails only in that she is occasionally too loud, and in two scenes discounts the effect of natural and pathetic sobs by too much repetition. The faults which Miss Bateman has still to correct consist in a certain monotony in voice and gesture—and of these she must rid herself before she can attain the position to which she has lately more and more exhibited her claim. Mr. Warner has as yet found the best vehicle for his powers in melodramatic acting, and Claude Melnotte is a purely melodramatic part. His direct and vigorous interpretation of passions which are simple enough, though overlaid by affected writing, is throughout admirable. His clear elocution tells finely in the stilted, but effective, speech describing the Prince of Como's imaginary palace; and while this excellence of speech accompanies his interpretation of the part throughout the piece, he makes the best use of the opportunities which Lord Lytton gave for the display of emotion. In this connexion we may mention specially his fervid and vigorous outburst at the end of the last scene, when Claude throws off his disguise and reveals himself. The other parts are well acted, and the play is well put on the stage.

The continuing success at the Gaiety of *The Mighty Dollar* marks in a curious way the excellence of the acting displayed in the piece. The same thing has happened with other pieces, and notably with *Our American Cousin*; but, compared to *The Mighty Dollar*, *Our American Cousin* is a play marked by genius. Both are bad plays; but *The Mighty Dollar* is infinitely the worse. Mr. and Mrs. Florence have done for the one piece what Mr. Sothern did for the other. Their acting is, in its kind, admirable; and the playing of the smaller parts is also good. We may call special attention to the scene between Miss Gilchrist and Mr. Andrews. It is a pity that actors of deserved reputation should be content to appear in such a play; but that fact does not affect the excellence of their performance. We look forward to Mr. Florence's promised appearance in the part of Captain Cuttle.

REVIEWS.

FAGAN'S LIFE OF PANIZZI.*

SIR ANTONIO PANIZZI was a man who in his day rendered very valuable services to the British Museum, who had a great knowledge of the bypaths of literature, and who was acquainted with and respected by a large number of eminent men in England, France, and Italy. If sufficient materials for the

* *The Life of Sir Antonio Panizzi, K.C.B., late Principal Librarian of the British Museum.* By Louis Fagan. London: Remington. 1880.

biography of such a man could be collected, it was natural that he should find a biographer, and if passionate devotion to the subject of a memoir constitutes the chief qualification of a biographer, the right man has appeared in Mr. Fagan. Connected by old family ties with Panizzi, overflowing with personal gratitude and associated with him in the working of the British Museum, he has approached his task with a rapturous fervour of admiration. It is impossible not to regard with tenderness so much affection, and that Panizzi should have inspired it is the best testimony the reader could have to the sterling merits of the subject of this biography. The work is pervaded by a spirit of almost infantine simplicity. The great Panizzi, the humorous Panizzi, the ominous far-seeing Panizzi, the Panizzi with a master mind and master spirit, exists so strongly as a reality to the writer, that he confides in the reader to see it all, even when nothing else is given as food for the imagination except a story of some quarrel between Panizzi and his numerous adversaries, an ordinary letter on an ordinary subject, or some political communication of no kind of importance. Further, in order to contribute everything of every kind within his power that may do honour to his hero, Mr. Fagan, who seems to have a turn for drawing, has thrown into the letterpress a series of the oddest little woodcuts that were ever imagined. They are pitched into the middle of the text, and are supposed to give a representation of eminent persons mentioned in the course of the narrative. The general result is to suggest that Panizzi had an extraordinarily large, distinguished, and hideous acquaintance. But, even if he had left out his superfluity of gushing and his illustrations, Mr. Fagan could hardly have written a biography of Panizzi which, merely as a biography, would have been good. He had not sufficient materials. Some of the things which Panizzi did for the British Museum can be ascertained and described, but they happen to have been things which are necessarily interesting only in their general results and not in their details. His energy as a reforming librarian was merely, however, one part of Panizzi, and one of his titles to such eminence as he reached. He had gifts, qualities, and a vast variety of knowledge, which made men of the highest distinction in different ways and in different countries court his acquaintance, consult him, respect him, and treat him with a cordial familiarity that never lapsed into condescension. But it may have been impossible for any biographer, and it certainly has not been within the power of Mr. Fagan, to give the reader any explanation of the fact that Panizzi was the confidential correspondent of Mr. Gladstone, Lord Palmerston, Lord Russell, M. Thiers, Cavour, and a host of other men scarcely inferior. Panizzi published scarcely anything beyond a few observations on Italian poetry; and while few of his letters have been preserved, few of those that have been collected by Mr. Fagan are of a kind to show what there really was to make the writer of the letters remarkable. There are, however, many letters written to Panizzi which Mr. Fagan has preserved, and although these do not much help the biography of Panizzi, they have sometimes an interest of their own. Lastly, Panizzi was an ardent lover of his native country, and worked hard and ventured something for Italy at a very critical time of Italian history; and in the Italian part of the biography there is undoubtedly something which shows his character, and is in itself worth reading.

Antonio Panizzi was born at Brescello, in the duchy of Modena, in 1797, both his parents belonging to families distinguished in the law. He was educated at the University of Parma, and took his degree in law in 1818. As a young man he was in high favour with the reigning Duke, and was made an Inspector of Public Schools while continuing with success his profession as an advocate. But he was one of the fervent patriots of his day; he joined the Carbonari, was arrested, but escaped with the connivance of a friendly official, and made his way to Lugano, where he wrote a book on some recent Modenese trials, and this book was so violent that in later life he thought it better not to speak of it. Arriving in a state of destitution at London, he was advised by Ugo Foscolo to try his fortunes at Liverpool, where a letter of recommendation to Mr. William Roscoe, the author of the Life of Leo X., secured him a cordial welcome. At Liverpool he stayed, giving lessons, delivering lectures, and making friends, until in 1828 he was appointed Professor of Italian Literature in the new University of London. During his tenure of this office he published an edition of some of the works of Italian poets, preceded by a dissertation on Italian Romantic Poetry; and in 1830 he was made, through the influence of Lord Brougham, Extra Assistant Librarian in the British Museum. Shortly after his obtaining this appointment he was invited by the Royal Society to make or help to make its catalogue. He soon quarrelled with his employers, some of whom thought they could make a catalogue better than he could. He laughed at them, stormed at them, and was dismissed. He was, however, employed to assist in making a new catalogue of the British Museum, and acquitted himself so well that a serious, but ineffectual, effort was made by friendly Trustees to procure an increase of salary. But in 1837 the post of Keeper of Printed Books fell vacant; and Panizzi, although warmly opposed on the ground of his being a foreigner, was appointed simply on his merits. As Keeper of the Printed Books Panizzi directed the making of a catalogue on his own plan; was nearly present at the breaking of the Portland Vase, and would "have been delighted to have stopped the offender if he had known what the man had been doing"; presided over the acceptance of the Grenville Library; got the Government to give an increased sum of 10,000*l.* a year for the purchase of books; enforced the provisions of the Copyright Act, by which copies of every publication were to be delivered to the Museum; and, finally, invented and executed the superb new Reading-Room. During all this time he was engaged in quarrels of the most violent character. The union of the office of Secretary and that of Keeper of Printed Books made Panizzi "master of the British Museum," and when he had entirely his own way he was tolerably pacific; but he was never quite himself unless he was quarrelling with some one. In his quarrels the side he took was generally the right one; but he was the most overbearing and dictatorial of men, and the right side gained nothing of grace, although it undoubtedly gained much of strength, from his advocacy. In 1856 Sir Henry Ellis died, and Panizzi was made Chief Librarian; and when Mr. Monckton Milnes, in the House of Commons, raised once more the objection that Panizzi was a foreigner, the appointment was warmly defended by the Speaker, Mr. Disraeli, and Lord John Russell. In 1865 he retired, with a pension of 1,400*l.* a year, and with the most ample recognition of the great services he had unquestionably rendered to the Museum. In 1868 he was made a Senator of Italy, and in 1869 a Knight Commander of the Bath. Thenceforward he lived in dignified retirement, but in broken health, and he died in April 1879, almost his last visitor having been Mr. Gladstone.

With Mr. Gladstone Panizzi maintained a warm and intimate friendship, cemented by, if not mainly originating in, Mr. Gladstone's ardent interest in Italy and Italian literature. But it was not only with politicians who, like Mr. Gladstone, were specially interested in Italy that Panizzi held relations of pleasant and confidential intercourse. He was able to make the influence of his personal character and of his vast knowledge tell in quarters where confidence would never have been inspired except by a man of very exceptional merit. During a considerable portion of the period in which the question of the Spanish Marriages was being discussed and the intrigues of Guizot were creating international difficulties, it was through Panizzi that the views of Thiers were communicated to the Whig leaders, and what they had to say was sent back to Thiers. In 1845, Lord Clarendon wrote to Panizzi, "It is quite a *bonne fortune* for Thiers, and important, moreover, to the relations between the two countries, that he should have fallen into your hands here, for there is no one so capable of properly directing his inquiries and opinions." To direct or satisfy the inquiries of Thiers was certainly not an easy task, for he wanted to know very much in a very little time. "Don't you remember," wrote Lord Clarendon in another letter, "his famous note to Ellice, who was then Secretary of the Treasury? 'Mon cher Ellice, je vieux connaitre à fond le système financier de l'Angleterre; quand pourrez-vous me donner cinq minutes?'" Perhaps no one could have told an inquirer more in five minutes than Panizzi, and when he has a statement to make on behalf of Lord Palmerston as to the history of the Spanish Marriages, he makes it clearly, briefly, and fully. Most of his correspondence—with the exception of a few letters on current English politics, in which he writes sensibly and with strong Whig views, and of letters of ordinary civility and business—relates to Italy, and is mainly addressed to Italians. There is, however, one exception. In the later years of his life Panizzi corresponded frequently with Prosper Mérimée, and several of Mérimée's letters to Panizzi are published by Mr. Fagan. Here again the exceptional position accorded to Panizzi shows itself. It is now the business of Panizzi to convey to Mérimée, for the benefit of the Imperial Court, the views of an important section of English society on political, and chiefly on Italian political, questions. It is the business of Mérimée to let Panizzi's influential friends know the views and the doings of the Imperial Court. This is the more remarkable because Panizzi's own views about Italy, about the French intervention in Italy, and about the Pope and his friends were scarcely such as to have seemed likely to recommend him to the Emperor, and still less to the Empress. Panizzi was not only a sincere patriot, but outspoken, even to the verge of rashness; and, although he had the art of pleasing when he did not concern himself to offend or to triumph, he was incapable of manœuvring himself into importance by the kind of tact which borders on pusillanimity. How real his importance was is conspicuous in this correspondence with Mérimée and in the letters that grew out of it. He writes to warn the French Court of the alienation of the leading English statesmen from the Emperor. He again writes to let the Emperor know that Mr. Gladstone, who longer than others had confided in the Emperor, was being brought round to the opinion that France was not treating Italy honestly and fairly. He writes to Cavour to tell him what the Emperor had stated to be his policy, what criticisms the writer had passed on this policy, and ends by saying that Sir James Hudson is to be informed of the contents of the letter, and that he had communicated with Lord Palmerston and Mr. Gladstone before writing. No correct notion of what Panizzi was can be formed unless it is borne in mind that he was the chosen intermediary of such men as the Emperor, Cavour, and the leading English Ministers, and that, while acting as an intermediary, he always conveyed his own opinions, and found his opinions treated with deference and respect.

Much the most interesting part of Panizzi's Italian correspondence refers to the Neapolitan political prisoners Poerio and Settembrini. In 1851 Mr. Gladstone published his famous letters on the injustice of the sentence by which these and other honourable Neapolitans had been sentenced to imprisonment, and on the atrocious treatment they received in prison. Panizzi had, among

his other correspondents, Lord Shrewsbury, and Lord Shrewsbury refused to believe a statement so unfavourable to a good Catholic like the King of Naples, and begged that Panizzi would come to Naples and judge for himself. Panizzi was ready to comply with the suggestion, went to Naples, saw the King, obtained permission to visit the prison, and found everything as bad as Mr. Gladstone had asserted. Settembrini was subsequently transferred to a prison in the small island of San Stefano, and Panizzi conceived the idea that the escape of a prisoner from a place that could be easily approached by sea might be managed. Somehow or other Settembrini managed to communicate with his wife, and he arranged that, if a vessel was sent to take him off, and he could know exactly when it was coming, he hoped to be able to get away. It took Panizzi some time to mature his plans; but at last, chiefly through the aid of Mr. Gladstone, he collected the necessary money, and chartered a steamer which was to carry off Settembrini. The details of the proposed rescue were submitted to and fully approved of by one of the English Attachés at the Court of Naples, and everything that passed seems to have been within the cognizance of our Minister there, and to have been countenanced by him. Panizzi asked for a holiday, and went to Naples to superintend personally the operation he had set on foot. Morally, no doubt, all that was done was well done; but, from a technical point of view, it seems a curious departure from ordinary propriety that a statesman who had only just ceased to be a Minister, a public servant in a national institution, and the British Legation at Naples, should have set themselves to release by a stratagem the subject of a prince with whom we were nominally holding friendly relations. The project miscarried, as the steamer which had been hired foundered at sea on her way from England. But at the very time when Panizzi was engaged in putting the last touch to his scheme, an incident happened which indirectly led to the release not only of Settembrini but of Poerio. It was an incident which showed Lord Palmerston's very peculiar style of treating Powers which he at once despised and detested. The English Minister at Naples sent an Attaché to the Superintendent of Theatres with some trivial message about an English singer. The Superintendent was found at the San Carlo by the Attaché, and received his message with kindly civility. The Minister of Police, a man named Mazza, on this sent a messenger to the Superintendent, to reproach the Superintendent for having received a member of the British Legation in a civil manner. This message was overheard, and Mazza was also heard to say that he would not allow himself to be imposed on by England, which was now a fourth-class Power. The occurrence was repeated to the English Minister, who wrote to the Minister of Foreign Affairs to remonstrate, but no notice was taken of the remonstrance. Panizzi, when he heard of what had happened, expressed himself delighted, and felt sure that Palmerston would not overlook the affair. Panizzi was right. Palmerston did not overlook the affair. He at once announced to the British Minister at Naples what he thought ought to be done. His idea of what was necessary and right under the circumstances was that three English men-of-war should anchor off the Bay of Naples opposite to the King's palace; that then a demand should be made for the immediate dismissal of Mazza, and that two hours' law should be given. If, within that time, the King had not announced the dismissal of Mazza, then the palace was to "share the fate of Sweaborg." This terrible programme was not realized; but the King, who knew enough of what was proposed to become thoroughly frightened, dismissed Mazza. A more lenient Minister of Police was appointed, and he determined to get rid of Poerio, Settembrini, and a whole host of political prisoners, by sending them to America. This was done; but when the prisoners had got as far as Cadiz, and had been transferred to an American ship, the master was induced or compelled to take his passengers to Ireland, and in a few months after the failure of his project, Panizzi had the satisfaction of seeing his friends in London. They were really released because the Government of Naples thought it dangerous to keep any longer men about whose sufferings there was so great a stir in England. The chief creator of this stir was Panizzi, and it was therefore he, who really triumphed over the Neapolitan Court. Energetic as he was throughout life, he never displayed greater energy, or with more success, than on that occasion; and not even the construction of the new Reading-Room made his value more deeply felt by his admirers in England than this display of activity and daring.

KINGLAKE'S INVASION OF THE CRIMEA.*

THERE are but few subjects on which it would be safe for a writer—even if he were as a writer more gifted than Mr. Kinglake—to administer his shocks to the public in the intermittent fashion which has characterized the publication of the *Invasion of the Crimea*. But the author has perhaps hardly been injudicious in takings things so quietly. Even after a quarter of a century, the matters which he treats of are still personal matters to a vast number of living men and women, and the whole subject of the Crimean war is one which has not lost, and scarcely can lose, its interest with Englishmen. We have since waged wars enough, and the intrinsic interest of this struggle sinks into insignificance beside that of the Indian Mutiny. But it is still our latest European contest with arms in our hands, and it must always occupy in history the position of a turning-point in the whole attitude and behaviour of England on the question of army management, while, many as have been the popular ferments since, none has approached that which broke out when the reports, true or false, of the mismanagement of affairs in the winter of 1854-55 arrived. It is with this particular period that Mr. Kinglake deals in the present volume.

It is needless to say to any one who has read the first five volumes of the *Invasion of the Crimea*, or who has read or heard anything about them, that the book is in the main nothing more than a long exculpation of Lord Raglan from the charges brought against him, and, more than that, from the charge of being in any way responsible for the sufferings of the troops. What, however, strikes us as somewhat novel in this sixth volume of Mr. Kinglake's work, is a certain deficiency of detail which, if not wholly unexpected, is remarkable enough in comparison with the elaborate minuteness of certain earlier chapters and volumes. The book before us is a big book, but it is curious, when one reads it attentively, to find in how small a compass the facts of positive information go. The author who gave us elaborately descriptive accounts of the exact position of every man (almost) at the battle of the Alma passes over the subject of the hurricane of November 14, tempting enough to a picturesque writer, in eight pages. In much else of the work we find a certain determination to talk "about it and about it" rather than a determination to give us "it" itself. Mr. Kinglake is bitterly angry with the *Times* for its garrulous invectives, and he seems to think it is part of his duty to make up for these by equally garrulous apologies at this distance of time. A great deal of the book, too, is vitiated by his old and apparently incurable habit of endeavouring *enfoncer les portes ouvertes*. He undertakes, for instance, to give an account of the arrangements, or rather the lack of arrangements, for war administration in England, which brought about the "winter troubles." It is quite right that he should do so. But, instead of making a frank acknowledgment that, while the navy had been almost constantly in active work, and from the nature of things was worked on the principle of individual responsibility and almost autocracy, the army had only spasmodic exercise, and was so graded that the responsibility of any single act was divided among a hundred different officers and functionaries, Mr. Kinglake has drawn up an elaborate picture of a Satanic conflict between the "personal king" and the "State king"—the former being allowed to exercise a constant and fatal influence on the army, and none on the navy. There is no student of English history—we might say no reader of *Roderick Random*—but knows the argument to be worthless. There were times when the navy was in the highest disorganization; but the inexorable fact of a ship being a world to itself, and out of the reach of control for months or years, determined the general efficiency of the English fleet. Whenever a capable officer was, in relation to the land-unit, the army, in the position in which the captain was to the sea-unit, the ship, then things went well. Mr. Kinglake is indeed bound to admit the existence of Wellington, who, according to him, succeeded in baffling the baneful influence of the "personal king." We confess that we had thought that Wellington's chief difficulties were with what Mr. Kinglake calls the "State king,"—that is to say, the Ministry. But this is a detail. Wellington, we say, is taken account of, but of Marlborough, Peterborough, Wolfe, we hear nothing. Nobody who knows anything about the subject denies that the complication and rivalry of the various offices and persons having the control of the army was, under the old system, nearly as bad as it could be; but nobody who knows anything about the subject can fail to see that the reason of the inferiority of army to navy organization is to be found partly in the simple fact already mentioned, partly in the simpler fact still that Great Britain is an island. France was usually unsuccessful with her navy, generally successful with her army. Will Mr. Kinglake tell us that a personal king usually interfered with the French marine and left the French land service alone? He has given so much space to raising this bogie of personal rule, and to describing its horrid features and practices, that we have been obliged to take note of it; but it has, of course, but little to do with the real subject of the book. The simple facts are that England had not waged a European war for forty years, and that unwise economy had cut down the military establishment, which establishment had never been fully or properly organized. An immense strain was therefore suddenly thrown on hands not strong enough to bear it, and the result was inevitable.

The questions with which Mr. Kinglake deals in this volume may be said to be the responsibility of Lord Raglan for the sufferings of the army, the conduct of the *Times* in relation to those sufferings, the conduct of the Duke of Newcastle, and the conduct of Lord Panmure. Incidentally, of course, a certain narrative of facts is given, including a sketch of the condition of the French as well as of the English forces, and, in particular, an account of the accomplishments of Miss Nightingale. But the bulk of the volume is a disquisition rather than a history. All the points we have noticed are indeed of no little importance, especially the second, because it involves the famous and much-vexed question of War Correspondents and of the limits of newspaper comment. All of them, perhaps, may deserve a little attention here. With regard to Lord Raglan, Mr. Kinglake has, in the main, proved his point, if indeed it required to be proved. That Lord Raglan was untiring in asking for the supplies which never came, or came only so late

* *The Invasion of the Crimea.* By A. W. Kinglake. Vol. VI. *The Winter Troubles.* Edinburgh and London: Blackwood & Sons. 1880.

as to be useless, or lay at Balaklava because transport was impossible; that on his own responsibility he managed to obviate a good deal of the evil thus caused; that he was constant in his inspection of the camp and unsparing of himself in every way, Mr. Kinglake has abundantly shown. But perhaps this does not quite exhaust the matter. Mr. Kinglake makes a great, though not too great, point out of the hopeless numerical insufficiency of the English forces for the tasks they had to perform, and the unequal distribution of labour between them and their allies. He admits that an ideal commander would perhaps have said to his French colleague, "This must not go on any longer," and have stood to it at any price. But he lays great stress on the helplessness of Lord Raglan's position. When the English General threatened withdrawal, Marshal Canrobert is reported to have said, "Milord, vous ne le pouvez pas," and Mr. Kinglake thinks that this expressed the literal fact. But is not a general to blame for allowing himself to get into such a position? Mr. Kinglake is ready again. He tells us that it was the fault, partly of the French and partly of the Engineers. The latter said positively that Sebastopol would be Lord Raglan's at the end of October, and therefore he postponed the conversion of the track between Balaclava and the front into something like a traversable road. We must ask again, Is not a general to blame for taking for granted the promise of his subordinates, and for not preparing for the failure of that promise? Lastly, though Mr. Kinglake has amply cleared Lord Raglan from the charge of wilfully ignoring the state of the camp, and has proved that he did all he could to provide necessaries, has he proved that he saw that these necessaries were applied properly? We think not. When we are told that a regiment received an order for so many blankets on such a day and did not fetch them till so many days after, we cannot help asking, did Lord Raglan know this? If he did not, why did he not? If he did, why was not the colonel of that regiment reprimanded? No doubt there was a deplorable absence of hands; but Mr. Kinglake's own eulogy of Messrs. Tower and Egerton shows with how very small a number of hands an immense amount of transport work could be done, even in the slough of despond which lay between the English forces and the sea. We need not say that it is no intention of ours to get up a case against Lord Raglan. But it is possible to be too thoroughgoing in defence as well as in blame, and the result of the one excess is generally the other. Mr. Kinglake has certainly been unjust to the Duke of Newcastle in his anxiety to clear his hero. In the absence of definite evidence to the contrary, is it not, to say the least, fair to conclude that some such doubts as those which we have here expressed had crossed the Minister's mind, and that he was at least not absolutely hectored into losing some of his confidence in Lord Raglan by the furious language of the *Times*? Mr. Kinglake is also very severe on Lord Panmure, and here we have little to say against his severity. The despatch and the private letter of the 12th of February, which Mr. Kinglake gives, form perhaps, when taken together, as discreditable a document as can be found in the history of any English Minister. Indeed the phrase might be extended. We might say that, with the possible exception of the conduct of the present Government to Sir Bartle Frere, the whole conduct of Lord Palmerston's Government to Lord Raglan deserves a similar description.

One point remains, and that is one of not the least importance. Mr. Kinglake is unsparing in his denunciation of the conduct of the *Times* at this juncture. We are not disposed to approve that conduct, but we think that Mr. Kinglake has imported a good deal too much of the personal element into the matter. The personal idiosyncrasies of editors and leader-writers may possibly be suitable subjects for writers in Society papers to occupy themselves upon, but the historian would probably be well advised if he let them alone. It seems to us, moreover, that Mr. Kinglake has somewhat confused two points of very different nature, the advisableness of publishing indiscriminate news from the seat of war and the advisableness of commenting freely upon the conduct of affairs. As to the former, there can be no doubt that in the infancy of War Correspondence the opportunities of the Correspondent were (more out of thoughtlessness and inexperience than anything else) grossly abused. It is to be hoped that the very rawest tiro, promoted from reportership to the status of Correspondent, would hardly nowadays describe the exact position of a powder-magazine in a letter which was certain to be read at the enemy's head-quarters. These indiscretions have been put a stop to, partly by the greater expertness of newspaper Correspondents themselves, partly by the strong hand which generals, even English generals, have at last exerted themselves to keep upon the dangerous inmates of their camps. But this question and the question of the attacks of the *Times* on Lord Raglan and his staff are two very different questions. Those attacks were, there is no doubt, in the very worst taste. In those days good taste was something of a new comer in the rough-and-ready fights of English parties and the English press. The *Times'* articles would have been considered moderate in the days of Cobbett or of Sterling; they seem excessive in our own. But, given the supposition that the editor and conductors of the *Times* really thought that there was mismanagement at head-quarters in the Crimea (and, whether they were right or wrong, there certainly was some colour for that supposition), their conduct, if somewhat wanting in moderation and balance, certainly seems to be excusable enough. Besides, is Mr. Kinglake, who charges all the defects of our army administration on the "personal king" and the "monarchical system," in a position to sneer at those who charged these defects on the "aristocracy"? We really think it is a case of Catiline and Cethegus.

It can hardly be necessary to say that this volume is too frequently disfigured by the irritating mannerisms which Mr. Kinglake has made his own. The management of the *Times* is always "the Great Company," Miss Nightingale is the "Lady-in-Chief," her official opponents are "the males," and the phrases are repeated until we wish that "the Great Company," and the "Lady-in-Chief," and "the males," and "our people," and all the rest of it, were at the bottom of the Euxine. But, despite of this, despite of the undue prodigality of argument and scantiness of fact to which we have referred, there are not wanting traces of the old charm of *Eothen* and the old vigour of the history of the *Deux Décembre*. We sincerely pity anybody who goes to Mr. Kinglake for his opinions, and we cannot say that anybody who goes to him for his facts will find them without some trouble; but the book at any rate is sufficiently differentiated from the crowd of books to be respectfully greeted.

MRS. GROTE.*

LADY EASTLAKE rightly calls her short account of Mrs. Grote a Sketch, and not a Life. All the material parts of Mrs. Grote's history are recorded by herself in the Life of her husband. She had nevertheless considered, after his death, the question whether it was desirable that she should have a biography of her own; but she recognized the "futility of all attempts to prolong the memory of individuals . . . for more than a few years after their disappearance from the scene. Thus, while I do not absolutely forbid the effort, I repeat my persuasion of its inutility." Lady Eastlake is well advised in attempting, if not to perpetuate the memory of her friend, at least to recall her to the recollection of those who knew her in her later years, and to furnish another generation with materials for appreciating the justice of a familiar social tradition. By circumstances, by personal and intellectual sympathy, and by tried literary ability, Lady Eastlake is well qualified for the task which she has undertaken. Even if the subject of her little book had been an imaginary character, it would have been worth while to describe a personage so remarkable and so true to nature. Lady Eastlake, while she admits that Mrs. Grote had no pretension to genius, somewhat inconsistently compares her to Mme. de Sévigné and Mme. de Staël, who were both eminent and original writers. It is possible that Mrs. Grote may have been as brilliant as either of them in conversation, but one of them wrote the celebrated Letters, and the other wrote *Germany* and *Corinne*. Of the later and better known of the two famous Frenchwomen, Mme. de Staël "had literally a passion for talk, especially her own." Mrs. Grote, on the other hand, was a good listener, and, unlike Mme. de Staël, she had a strong sense of humour. "The English lady came into society as much to hearken as to be heard, and she listened to all worthy of attention, and especially to her own husband. Knowing what she could say if she would, her thoughtful silence became a compliment of the highest order." Her affectionate and sincere acknowledgment of Mr. Grote's superiority was one of the most attractive elements in her character. "I live," she once wrote, "with one so much my master, that the true feeling of conceit is effectually *stopped out*." The possession of rare practical gifts in which her husband was wholly deficient never tempted her into a false estimate of the comparative rank of their respective qualities. The subordination of the executive caste to the contemplative hierarchy was as willingly recognized by Mrs. Grote as by a disciple of Brahminical teachers or of Plato. Mrs. Grote herself had considerable literary powers and large attainments. In her earlier married life she acquired some knowledge of the logical and metaphysical studies to which her husband and his friends were at that time devoted. The strength of her attachment to him was proved by a severe test; for Mr. Grote, both during their engagement and after her marriage, "set her themes on various subjects, and gave her books to read of which he required her to send him a digest." On her part, as Lady Eastlake neatly remarks, "she fashioned, mounted, framed, and glazed him." "She would always have been deep enough and more than brilliant enough for society, but without her he would have remained socially and in a publicly literary sense almost unknown. 'Mill the elder,' she would say, 'had seized him at the most enthusiastic time of life, and narrowed him under the plea of emancipating him.' His prejudices against rank and against society were strong, and she spent her life in dissipating them." She gave Mill and his associates the expressive, though vague, nickname of "the Brangles," and she summarized their subjects as "the quantification of the predicate" and the "unconceivability of the opposite." She probably went so far as to understand the meaning of both terms, and then to satisfy herself that they did not concern her, but she was not disposed to shrink from serious studies. Among the friends of her maturer life John Mill and Tocqueville were the nearest In political economy she took a special interest, always connecting the theory of the science with her own experience of practical and rural life. While she was still comparatively young she had corresponded on the subject with Jean Baptiste Say. It may have been curious, as Lady Eastlake says, "to observe a woman in the zenith of youth and beauty analysing the process and exposing the demerits of our system of

* *Mrs. Grote.* A Sketch. By Lady Eastlake. London: John Murray. 1880.

grand juries"; but, on the whole, the judgment of the cleverest woman on judiciary arrangements cannot have been extraordinarily valuable.

As Mrs. Grote's eulogist says little or nothing of her literary taste, it may be assumed that she cared less for poetry, or even for the form of prose composition, than for other arts. Her *Life of Ary Scheffer* records her interest in painting; and it seems that her knowledge of music was still more accurate and profound. In extreme age she still practised music herself, and she always cultivated the society of musicians. She was perhaps fortunate in her indifference to literary finish, as she corrected all the proofs of the voluminous *History of Greece*. No modern work of equal importance and celebrity is so deficient in grace of expression. The experience of posterity will show whether substantive excellence is capable of preserving an instructive book in the absence of style. Mme. de Sévigné would have been incapable of writing, and perhaps of reading, a page of such a work. Fortunately a correct ear for verse or for prose is not indispensable to good conversation; and there is but one opinion among those who had the opportunity of judging as to Mrs. Grote's social brilliancy. Her intellectual activity was supported and stimulated by a temperament which in her youth displayed itself in the form of high animal spirits. There can be few, though Lady Eastlake says that there are still some, "who remember the beautiful and enthusiastic young woman, with the neat foot and ankle, who was 'up to everything'—playing, singing, drawing, dancing, riding, and driving, no less than joking, quizzing, mimicking, and flirting; though all in perfect innocence and gaiety of heart, far removed from the 'fast' freedoms that have obtained in the present day." Mr. Grote's themes and digests of abstruse books failed to subdue her happy elasticity of nature. The same vital energy explains in some degree the skill and industry with which she managed her household and her husband's affairs. "She knew how everything should be done, from the darning of a sock to the building of a house." When she removed to her latest residence in Surrey the neighbours thought "that so learned a lady would be above knowing what went on in her own establishment. 'You are much mistaken,' said one better informed. 'Mrs. Grote will know when a hoop is off a pail in her back-kitchen.'" One invaluable quality, if it ought not rather to be called freedom from one defect, contributed at the same time to her administrative efficiency and to her social success. Entirely exempt from shyness, she could deal naturally and pleasantly with her equals and with those of a humbler class. No other gift conduces more directly to ease in conversation and in business. One compensation for advancing years frequently consists in diminution of shyness, as experience teaches men or women that they are not habitual objects of critical observation. Mrs. Grote appears to have begun where less healthy constituted minds scarcely rest after long effort and reflection. Her manner was, as Lady Eastlake admits, on first acquaintance rather repelling than attractive; but an external show of hardness soon ceased to conceal her natural gentleness and generosity. Of two epithets which are etymologically akin while they have incompatible meanings, she might be called womanly, but never womanish. A little boy, eighty years younger than herself, hearing some one talk of friends, said, "I have got a friend. It's Mrs. Grote."

Both Mr. and Mrs. Grote had, as Lady Eastlake observes, the good fortune to belong to the wealthier section of the upper middle class. Her mother, of the Hertfordshire family of Hale, was married at sixteen; and "to this early marriage, and the large family which ensued, Mrs. Grote ascribes the totally uninteresting and undeveloped character of her mother." Her father, Mr. Lewin, a retired East Indian of easy fortune, had seen more of the world, having lived both in French and in English society. The tastes and morals of the time are curiously illustrated by his relations with Mme. Grand, on whom he settled an annuity, which she continued to draw when she had become Princess Talleyrand. Mr. Grote's Republican opinions, in which his wife never shared, perhaps rather facilitated than impeded her social career, and added piquancy to her success. His distinguished appearance and the courtly dignity of his manner would have well become a high-born Republican of the Commonwealth, though his doctrines were coloured by the French Revolution, and by the pedantic democracy of James Mill. In his later years he perhaps unconsciously felt the influence of his own position and of the country in which he lived. At all times he was a logical and not a sentimental politician; and consequently he inclined during the American Civil War, which caused the last great controversy of his time, to the Southern States, on the ground that secession was a constitutional right. Mrs. Grote has described with force and humour in her biography of her husband their joint enjoyment of his first election for the City of London, and the formation and gradual decline of the party of philosophical Radicals of whom he might be considered the leader. When their number was reduced to two or three, Mr. Grote retired from the House of Commons, where, notwithstanding his growing political isolation, he had always been respected. He owed to the sympathetic sagacity of his wife the impulse which urged him to substitute for political activity a new and more congenial career. The only relic of his brief Parliamentary experience which he took with him into his historical enterprise was his whimsical passion for the Ballot in Athens as in England. Many of his readers have been amused by his characteristic enthusiasm for the system which in ancient Greece was employed without special motive as a part of the ordinary machinery of elections. Mrs. Grote spent her life in dissipating his prejudices against rank and society. She was also less indifferent than her husband to money, though they had always a sufficient income. In her Life of Grote she shows that, after half a lifetime, she still felt a kindly irritation against the perverse obstinacy with which he refused to pay attention to one of her rich relations. Affection, combined with discernment of character, is always clear-sighted, though persons who are born without knowledge of human nature are blind to the faults of those whom they love. Mr. Grote, in his own case, "mistook frail reason for stoical principle." "Her *forte* was her insight into character, and she enjoyed the curious mixture of stern republicanism and shrinking fastidiousness in him. 'Burning,' she would say, 'with desire to see all his fellow-creatures equal, yet not able to exchange a word with a common vulgar man without disgust.'" Mrs. Grote "would have accepted the offered peerage without hesitation, though no one more thoroughly appreciated his refusal of it, or enjoyed the naïve reason principally given." Romantic and disinterested men ought to consider the feelings of their wives before they decline profit and honour which women are almost certain to appreciate. It is true that a peerage could not be indispensable to the happiness of a famous man and a celebrated woman living in the best society of England; but the gold suggests the fitness of the guinea stamp which officially indicates its value.

It is to be regretted that Lady Eastlake has not been able to enrich her book with letters from Mrs. Grote, or from her numerous correspondents. The less interesting part of the volume contains a few letters to M. and Mme. Léon Faucher, who, after Tocqueville, were among the most intimate of their friends in France. Discussions of bygone French politics are intrinsically tiresome; and M. Faucher's reputation is already obsolete. Both Mr. and Mrs. Grote considered France as a second country or home; and they consequently entered with cordial interest into the struggles of Republicans against the constitutional Government of Louis Philippe, and the hostility of both parties to the second Empire. It seems that they had also cultivated a feeling of enmity to the First Napoleon so vehement that they judged of others by their estimate of the great conqueror and despot. Mrs. Grote's political opinions and prejudices may conveniently be forgotten. Though not a Republican, she was a utilitarian Liberal; and her character and merits would have been little affected if she had happened to be an orthodox Tory. It was scarcely worth while to record her wish that the Turks should be expelled bag and baggage from Europe. The steady pressure which she exercised on the opinions of her husband, without interruption or relaxation of her respect and sympathy, is more characteristic and more admirable than any political dogma which she could have propounded. The truths which such women as Mrs. Grote inculcate are of less public, though not necessarily of less general, application. The propositions which Lady Eastlake has selected for quotation are not perhaps profound or original. Mrs. Grote, it seems, exhorted her younger friends to keep their engagements, and advised them to cultivate a taste for simple pleasures. Similar doctrines are illustrated by story-books, and even circulated in copy-books; but thoughtful and wise women contrive to change languid acquiescence into practical conviction. Mrs. Grote was too active in mind and too witty to confine herself to ordinary commonplaces. She also taught in the form of paradox and with the aid of humorous illustration domestic and social maxims which were worth many essays on politics and political economy. Women of equal capacity probably survive her, but they are few, and they are not easy to meet with.

ANECDOTES OF PARLIAMENT.*

AMONG the hundreds of old stories, called by courtesy anecdotes, which Mr. Jennings has strung together in the volume before us, few of his readers will fail to find something that had escaped their notice, or had, at all events, slipped their memory. Thus, for instance, we are ready to confess that, though the following incident is narrated by Walter Scott, we had not remembered its occurrence among the peculiar humours of a famous historical episode:—

> The copy of the treaty of Union between England and Scotland was registered by the Scottish Parliament on the 25th of March, 1707, and on the 22nd of April the Parliament of Scotland adjourned for ever. Seafield, the Chancellor, on an occasion which every Scotsman ought to have considered as a melancholy one, behaved himself with brutal levity, and said that "there was an end of an auld sang."

Now it is quite possible that at the time a little cynicism may not have seemed altogether out of place after the melodramatic gush of such prophetic lamentations as that of Lord Belhaven; and every one knows that there are features in Scottish Parliamentary history which in some measure excuse the contemptuous tone of this farewell. But our reason for quoting the story is the contrast suggested by it with the sentiment which pervades, and must indeed have dictated, Mr. Jennings's collection. Whatever Englishmen, Scotchmen, and even Irishmen may at the present day think or say about their Imperial Parliament, they rarely affect to despise it as an institution. We may shake our heads, or in impassioned moments even our fists, at it; we may reprobate it

* *An Anecdotical History of the British Parliament, from the Earliest Period to the Present Time.* Compiled from authentic sources by George Henry Jennings. Horace Cox. 1880.

even after we have reformed it; we may denounce its degradation, or deplore its decline; but we rarely pretend to have lost our interest in it, or are able to listen with perfect indifference to the faintest echoes of its least adequate utterances. So, too, it would be sheer affectation to deny the fascination exercised by the *Anecdotal History of Parliament* now in our hands, put together as it is by a judicious paste-brush and an experienced pair of scissors. In order to distinguish it from a successful earlier publication in which he took part, Mr. Jennings has given his present volume a rather grand name, and has prefixed to his text a rather solemn preface. Yet in truth his wine needed no bush; we all know it, and we all like it—some of us, if the truth may be told, not the less for not being watered down with too transparently educational a purpose.

Of such a purpose Mr. Jennings may on the whole be fairly acquitted, notwithstanding the intention of instruction which seems to lurk in the title of his introductory section ("Rise and Progress of Parliamentary Institutions"), and notwithstanding occasional quotations from grave authorities such as "the learned and careful work of Professor Stubbs," who will, we trust, feel duly impressed by the compliment. At the same time, even though, as the preface sententiously puts it, "anecdotes of a humorous nature" may be thought by some to "occur in the book to an extent not to have been anticipated," and though its arrangement is in certain respects still more open to criticism, Mr. Jennings is in a position to urge the sufficient counterplea that his compilation will prove useful to many and agreeable to more. Its clear headings and copious index well adapt it for furnishing prompt and pointed illustrations to students of Hallam or May; while, on the other hand, it would be idle to quarrel with the collector for having grouped the principal series of his anecdotes after the fashion which will most generally commend itself to his public. For one person who would care to trace consecutively by means of a succession of striking anecdotes, say, the progress of the relations between the Houses of Lords and Commons, there are scores who prefer to find within the compass of a few pages the best known among the wise, witty, or untender sayings of Lord Palmerston or Lord Beaconsfield. Moreover, in a third part, consisting of "Miscellaneous Anecdotes," Mr. Jennings has at least attempted a more systematic classification of his surplus materials, carrying on the "anecdotal history" of elections, for instance, from the days of Henry VI. to the year 1880—which has assuredly done its part towards furnishing further materials for a new edition. Had he only more frequently, and more precisely than he has thought necessary, referred to the sources of his quotations, his anthology would deserve a place on the reference-shelves of many public as well as private libraries. As it is, the book is one which, as a publisher's "extract" might say, no active member of a University Union, and no new member of Parliament insufficiently versed in *Hansard*, ought to be without. Mr. Jennings is a judicious as well as an accurate transcriber. He eschews all encumbering verbiage, nor have we anywhere noticed that he misses the point of a story or the gist of a quotation. The printer, we hope, is responsible for the puzzling statement, cited from the elder D'Israeli, that "as yet uncrowned, on the day on which Charles I. first addressed the Lords and Commons (June 18, 1625), he wore his crown, and *veiled* it at the opening and on the close of his speech —a circumstance to which," naturally enough, "the Parliament had not been accustomed." By a less subtle misprint elsewhere, Algernon Sidney, who was executed in 1683, is made to date the decay of Parliamentary sovereignty in Germany from Charles VI., who assumed the Imperial crown in 1711. The quotation is indeed from a reprint of 1744, but the observation as it stands is meaningless as applied to Charles VI., while it would be in a measure intelligible in the case of Charles V., or of Charles IV. With regard, by the by, to the former of the passages just referred to, one would be glad to learn whether the author is correct in apparently implying that the opening by prayer of a sitting of the Lords was regarded as a novelty in the year 1625; at the opening of the Session, prayer had of course long been used. Frequently in the course of this volume, a note would have added to the interest of a passage. Thus Mr. Jennings states that "the Long Parliament of Charles II. derived its name of 'pensionary' from the fact that many of its members were in the habit of receiving bribes from the King and the Ministers"; and that "it has also been discovered that some of them" (the "members," we presume, though the "Ministers" might also put in a claim) "were in the pay of the Court of France." Neither the fact nor the discovery admits of contradiction; but the particular origin of the nickname seems to have been the system of corruption perfected by Danby, which, as Macaulay says, grew into the bribing of every man who had a vote. According to Evelyn (under date of January 15th, 1679), "the Long Parliament, which had sat ever since the Restauration, was dissolv'd by persuasion of the Lord Treasurer, *tho' divers of them were believ'd to be his pensioners.*" Again, Mr. Jennings correctly states that "the last time on which the power to reject Bills was exercised by the sovereign was in 1707, when Queen Anne refused her assent to a Bill for settling the militia in Scotland." But it might have been added that in 1844 the St. Asaph and Bangor Diocese Bill was withdrawn from the House of Lords after an authoritative statement that the royal assent to it would be withheld.

For its main purpose, however, this collection of anecdotes is essentially complete; and instead of dwelling upon omissions such as were virtually inevitable, we prefer to regard it under what seems to us one of its most attractive aspects. Of course we must do this at the risk of betraying the more or less dislocated condition of mind likely to ensue upon the continuous perusal of a volume of about five hundred pages, which ranges from the wit of Sir Thomas More to the wit of Mr. Bernal Osborne. Inasmuch, by the by, as the last-named politician receives the distinction of being taken out of the list of "minor celebrities" to which are relegated the evanescent brilliancy of Single-Speech Hamilton and the too solid worth of Sir John Barnard, he is rather hardly treated in being cited under the not very felicitous *sobriquet* of "The Stormy Petrel of Debate," and in being allowed only a single extract. We well remember listening to the speech from which this extract was taken, and which, whether extraneously inspired or not, was indisputably one of the few luminous contributions of British Parliamentary eloquence to the now forgotten history of the Schleswig-Holstein question. But to come to more recent times. It is entertaining as well as instructive to be reminded by Mr. Jennings's anecdotes how little of novelty there is in some of the newest Parliamentary experiences. Any member of the House of Lords, for instance, who has recently been frightened by the impassioned *à priori* reasoning of Mr. W. E. Forster, may take comfort from the observation that differences between the two Houses have occurred before now, and before now have passed away. In the year 1698 (N. S.) the House of Commons expelled one of its members for making false endorsements on Exchequer Bills, and passed a Bill for seizure of his estate. Yet, though the culprit had himself acknowledged the fact, the Lords, when the Bill was sent up to them, were not satisfied of his guilt. They accordingly discharged him from the Tower, to which he was in due course recommitted by the Commons. This illustration of the traditional jealousy between the two Houses is wanting in point, in so far as the end of the story is unknown. Such is not, however, the case with regard to a more violent collision between the Lords and Commons, which was narrated by the late Speaker of the House of Commons to a Committee:—

> In 1772 Mr. Burke complained bitterly that he had been kept three hours waiting at the door of the Lords with a Bill sent up from the Commons. The Commons were so indignant at this treatment of one of their number that, shortly afterwards, when a Bill was brought down from the Lords to impose a bounty on corn, the House rejected it by a unanimous vote. The Speaker then tossed it across the table on the floor, and a number of members rushed forward and kicked it out of the House.

This was only the climax of a series of indecent conflicts described by Sir T. Erskine May, in the course of which members of the House of Commons had been hooted from the Bar of the House of Lords, and members of the latter had been driven in revenge out of the doors of the former. Students of our constitutional history hardly need to be reminded that in the essential matter of the balance of power the House of Commons had long before this established its preponderance. But, just as the spirit of the Lords survived the ascendency of their House, so the self-consciousness of the Commons had been *haud impar congressui* before it actually gained the victory. We cannot help quoting from Mr. Jennings a note of Speaker Onslow (the third of that name) as to an occurrence belonging to the official days of his uncle:—

> When the Speaker, Sir Richard Onslow, went up with the House to demand justice against Dr. Sacheverell (1710), as the mace was going into the House of Lords before the Speaker the Black Rod endeavoured to hinder it by putting his black rod across the door; on which the Speaker said, "If he did not immediately take away the black rod he would return to the House of Commons." The Black Rod desired him to stay a little, and he would acquaint the Lords. The door was shut, and Mr. Speaker and the House staid without. After a little time the door was opened, and Mr. Speaker with the mace went in. As Mr. Speaker was going to the bar, the Black Rod attempted to interpose himself between the Speaker and the mace; upon which the Speaker said aloud, "My lords, if you do not immediately order your Black Rod to go away, I will immediately return to the House of Commons." Then Lord Chancellor Cowper directed the Black Rod to go from thence. Then Mr. Speaker, with the mace, went up to the bar. The Black Rod was then ordered to bring the prisoner, and was going to put him on the right hand of Mr. Speaker, who upon that said, "If you don't order the Black Rod to go with the prisoner on the left hand of me, at some distance, I will return to the House of Commons." Upon which the Lord Chancellor directed the Black Rod so to do, and then Mr. Speaker demanded the judgment, and the Lord Chancellor accordingly pronounced sentence upon the prisoner, kneeling at the bar.

The tone and temper of the Speakers of the House of Commons, it may be observed, have naturally at different times reflected the situation of Parliamentary affairs with tolerable faithfulness. On the whole, the list of Speakers is one to which the lovers of Parliamentary government may well look with satisfaction. It is disgraced by few examples of subserviency to a despotic throne comparable to the conduct of Finch, and is polluted by no second instance of "a callous heart and brazen forehead" like those of Sir John Trevor, who put to the House the question of a vote of censure upon himself. A noticeable incident, by the way, in the history of the Speakership is the refusal of Charles II. in 1679 to accept the Speaker chosen by the House of Commons, and the ultimate submission of the House to this refusal. It should, however, be observed that the dignity of the House was saved by a short prorogation, at the close of which the Opposition themselves proposed a new name. With all his insolence, Charles II. usually contrived not to go too far in thwarting any of his Parliaments; and in this instance, as Ranke points out, it was worth the while of the new majority to break with the traditions of the old.

Mr. Jennings's specimens of Parliamentary eloquence are of course mostly taken from periods subsequent to the Stuart reigns,

though, under the circumstances of his compilation, he has distributed his extracts far more evenly than could have been expected, and has wisely abstained from swelling his volume by too copious a selection of specimens from the oratory of these latter days. A collection furnishing sufficient materials for a reasonably fair comparative estimate of the Parliamentary speaking of different periods would indeed be worth making; but the difficulties in the way of any such attempt are perhaps insurmountable. Thus we may personally feel inclined to agree with "the chief orator of the United States, Daniel Webster, that the finest bursts of Parliamentary eloquence on record are to be found in the debates of the Parliament in the reign of Charles I." But do the actual relics of those debates, and the way in which they were preserved, entitle us to form a more than conjectural estimate of the power and effectiveness of those who took part in them, or even of their leading spirit, Pym himself? Again, is there enough real evidence extant to justify the opinion of Lord Brougham and others that in Bolingbroke British Parliamentary eloquence reached its height? Even in the case of Chatham and his contemporaries it is a familiar fact that the reported speeches differed very notably from those delivered by them. Mr. Jennings has at all events done his best to take away from the vagueness and indistinctness which are too often allowed to hang round the Parliamentary heroes of the past. There were lively as well as important debates before Fox and Pitt. There were wags even in the Long Parliament, whose very Speaker Lenthal was known on one occasion to have hazarded a joke. Trifles like these do not make up history; but they are worth keeping alive all the same. Mr. Jennings deserves thanks for something besides the good things which he has brought together between his covers; yet even these, old as they mostly are, do not come amiss in the present decline of wit and humour at Westminster. We will conclude with one of the best of them—Sheridan's of course:—

Lord Eldon left an anecdote-book in manuscript, in which he noted the following:—During the debates on the India Bill, at which period John Robinson was Secretary to the Treasury, Sheridan, on one evening when Fox's majorities were decreasing, said, "Mr. Speaker, this is not at all to be wondered at, when a member is employed to corrupt everybody in order to obtain votes." Upon this there was a great outcry made by almost everybody in the House. "Who is it? Name him! Name him!" "Sir," said Sheridan to the Speaker, "I shall not name the person. It is an unpleasant and invidious thing to do so, and therefore I shall not name him. But don't suppose, sir, that I abstain because there is any difficulty in naming him; I could do that, sir, *as soon as you could say Jack Robinson.*"

JOHNNY LUDLOW.*

MRS. HENRY WOOD'S short stories are certainly a great deal better than her novels in three volumes. Were she to consult her reputation, we are confident that she would do well if she henceforth never wrote a tale that could not be read from beginning to end over a cup of tea. In giving her this advice we are acting with little regard to our own convenience. One long story gives the reviewer much less trouble than a collection of short ones. Our chief trouble with a new novel is to get into our head a fairly clear notion of the different characters. When we have succeeded in this, we look upon our task as at least half done. It is not quite so easy a matter as at first sight may appear. In the first place, our writers of fiction, having, we suppose, exhausted all the simpler combinations, are forced to seek for an appearance of novelty in the most complicated plots. The lineage of a modern hero is as puzzling to understand as even the family tree of some baronet whose father was certainly Lord Mayor of London and whose remoter ancestor has been proved to be a Plantagenet. Then the heroine is often unreasonable enough to have a lineage of her own. When the difficulties of ancestry have been at length mastered, there are the further complications produced by the old family lawyers, who have made some most unlawyerlike wills. However, patience carries us through most things. Sermons do come to an end, and plots of novels are at last understood. It is a very different matter, however, when, as in the case of the book before us, we have nineteen openings that we must go through, and nineteen sets of characters with whom we must get acquainted. Some of the tales, indeed, are easy enough to follow, but this is by no means the case with all. In the fifth story, for instance, we are almost overwhelmed by the difficulties of the first two pages. In addition to Mr. and Mrs. Todhetley, Tod, and Johnny Ludlow, with whom we are already acquainted, we are introduced to old Coney and old Coney's wife, and old Coney's son Tom, and his daughter Jane, and his married daughter, Mary West, and her husband, and her baby, and her nurse. From these we are hurried along into the Ashton family, and learn all about old Ashton, and his son Robert the farmer, and Charles the clergyman, and James the doctor, and Mrs. James, a young lady with light frizzled hair, and their daughter Lucy, who had married a wicked Captain Bird. "Now," says Mrs. Wood, having thus confused us with this fresh host of people before we had succeeded in forgetting the characters of the four earlier stories—"now I hope all that's clear; because it was needful to say it." This, indeed, added the last straw to the load. We felt much as a stranger might feel at some large dinner-party who should be introduced by an old-fashioned host to every guest in rapid succession, and then told to feel quite at home, for he now knew everybody. It happened, moreover, more than once that, when we had at last got a tolerably clear notion of the new characters, we found the story was by no means worth the trouble we had taken. Mrs. Wood herself in one instance clearly had some doubt as to whether the proper destination of her tale was—not the circulating library—but the waste-paper basket. This she modestly enough shows by the title "Hardly Worth Telling." Praiseworthy though this title is in one respect, yet it is scarcely distinctive enough. It by no means, as we try to recall the various stories, brings any one of them in particular before our mind. To at least one-third of them it might with equal propriety have been applied.

Nevertheless, many of the tales are readable, and some of them have a certain cleverness of their own. They do not, indeed, come up to the first series which we reviewed some years ago. Johnny Ludlow himself, the old Squire, Mrs. Todhetley, and Tod, have lost a good deal of their freshness. Still they form among them a very convenient kind of framework, as it were, on which to hang a variety of tales. Johnny Ludlow's experiences of life are, indeed, of the most surprising nature. Never, surely, was there a lad who had come across such a host of out-of-the-way characters, or who had been a witness of so many wonderful adventures. The part he plays is generally that of bystander—a sympathetic bystander, we should say. He always feels for the good people who are weak and suffering, and is commonly made their confidant. They do not expect that he can help them, but they know that they can count on his friendliness and his pity, and on his rendering them whatever services a lad can render. In the power he has of entering into the feelings of others he forms a good contrast to the obstinate and stupid, but good-natured, Squire, and his no less obstinate son. This contrast Mrs. Wood often sets forth with not a little skill. In the first story, for instance, where we are told of the "Life of Trouble" of a poor chemist and country postmaster, whose heart was broken by the misconduct of his son; Johnny, though a mere boy, understands fully the feelings of the unhappy father. He is even allowed to know the secret troubles that were bringing him down to the grave. The Squire is utterly puzzled, and will not allow that there can be anything that should bring him in danger of his life. When, however, he hears that the man is really dying, he seizes his hat and top-coat in a wild flurry, and hastens off to the post-office to see for himself:—

It was quite true—Thomas Rymer lay dying. Darbyshire was coming out of the house as the Squire reached it, and said so. Instead of being sorry, he flew in a passion and attacked the doctor.

"Now look you here, Darbyshire—this won't do. We can't have people dying off like this for nothing. If you don't cure him, you had better give up doctoring."

"How d'ye mean for nothing?" asked Darbyshire, who knew the Squire well.

"It can't be for much: don't be insolent. Because a man gets a bit of anxiety on his mind, is he to be let die?

"I've heard nothing about anxiety," said Darbyshire. "He caught a chill through going out that day of the snowstorm, and it settled on a vital part. That's what ails him, Squire."

"And you can't cure the chill! Don't tell me."

"Before this time to-morrow, Thomas Rymer will be where there's neither killing nor curing," was the answer.

The Squire runs up into the dying man's room and says, "Now, Rymer, my poor fellow, couldn't you—*couldn't* you make a bit of an effort to live? To please me; I knew your father, mind. It can't be right that you should die."

The pleasant simplicity that certainly forms the groundwork of these tales is sadly marred by more than one kind of folly. Mrs. Wood does not hesitate to bring in apparitions, ghosts, and dreams when she is at a loss for a subject. Nothing could be sillier than the tale that she calls "Seen in the Moonlight." It certainly has this merit, that, though it is a ghost story, it might nevertheless be read at midnight with perfect composure by even a very superstitious and timid person. It is meant to be thrilling; but it thrills nobody. It is meant to be affecting; but it affects nobody. The hero sees a spirit, just as his elder brother had seen one, and just as his father had seen one, and at once dies. Whether he dies of the spirit or of a rheumatic fever—he had been out on a boating trip, and the night before his death had slept in a tent—we do not clearly make out. At all events, his death brings us to the end of the tale, and that is enough for us. Still, much as we dislike the ghosts, we find them on the whole pleasanter company, if not indeed truer to nature, than the baronets and their ladies. Baronets, as Mrs. Wood's readers must know very well, are an order of men that are especially dear to her. They hold in her stories somewhat the same place that was held in old days by the inferior spirits of the earth, air, and water. They are above ordinary mortals; but they are not, like the Gods, so far above them as not to share easily in their fortunes. They are of two orders, for some are as benevolent as others are malignant. They either cause a vast amount of suffering, or they are ready to find a balsam for it by the timely offer of their hand and fortune. In one of the longest tales in this series we have, for instance, a most virtuous and admirable young lady named Anne. She suffers all that a daughter can suffer from a wicked stepmother and her no less wicked daughters. She is persecuted by an abandoned man of fashion, who by the most polished manners wins her heart. She discovered in time that he was married, and that his wife was living. Her father dies, and she is left a second Cinderella. The wicked stepmother and her daughters make a common drudge of her, while they waste the money that ought to have been hers. No heroine could have been in a more forlorn state. She was bent on

* *Johnny Ludlow.* Second Series. By Mrs. Henry Wood, Author of "East Lynne." 3 vols. London: Richard Bentley & Son. 1880.

going out as a nursery governess. The reader, however, remembers that very early in the story there had been introduced, as if by chance, a middle-aged unmarried baronet—"a fine-looking man, with greyish hair, and a face that you took to at once." He had remained in reserve like the Guards at Waterloo till the close of the day. At the right moment he is moved forward by the author in a very skilful manner, and is made to offer his hand to the heroine. She of course accepts it, though she is greatly surprised by his proposal, and they live happily ever after. A baronet of an earlier story is not quite so good a man; but then he had a very stern mother, who would not allow him to be as virtuous as he wished. If we cannot altogether admire his character, nevertheless we are struck by his appearance and his dress. He was "a well-looking gentleman, of some five-and-twenty years. His light morning coat was flung back from the snowy white waistcoat, across which a gold chain passed, its seal drooping; a blue necktie, just as blue as his blue eyes, was carelessly tied round his neck." It is almost equal to the descriptions of costumes that we find in the acting copies of a play. His mother's dress is not described with the same fulness, yet we read with satisfaction that "she gathered her mantle of purple velvet about her as she got up." Her footman, by the way, was tall; and, when he "confronted" the village doctor, had "a gold-headed cane and big white silk calves."

Much as Mrs. Wood gets out of baronets and baronets' ladies, she gets, we believe, even more out of coroners. She is fond of sudden deaths, and no less fond of the inquests which sudden deaths occasion. She has a crowner's quest law all of her own. From the delight that she would seem to take in horrors she must surely at one time of her life have made a study of the reports of inquests in the newspapers. Her ignorance, however, of the way in which they are held is almost incredible. Her coroners never hesitate, without even a word of warning, to lead a witness to criminate himself. In fact, they examine a suspected man just as if they were criminal judges in France. Her magistrates are little better than her coroners. She describes how a young farmer was arrested on a charge of murder on the day fixed for his wedding. The Squire goes to the police-court, and finds the accused man telling his tale, while another man, apparently at the same time, "was contradicting him, and swearing hard and fast that it was a case of deliberate murder." The Squire was invited by the magistrates to a seat beside them. "The first thing he did was to break into a hot tantrum, vowing Robert Ashton couldn't be guilty. How it would have terminated nobody knew, but Lucy saved him." The proceedings of the magistrates had indeed been irregular. They had begun by making the mistake—for a mistake it certainly was, though the author does not seem to notice it—of not ascertaining first that any one had been murdered. When the supposed dead man walked into court, with a big white plaster on his forehead, all that was left to do was for the whole Bench to shake hands with the prisoner and to let him go off in triumph.

We must not conclude without doing Mrs. Wood the justice to admit that she is really very successful, on the whole, in keeping her language down to the simplicity of her hero. It was no doubt a great effort to her to lay aside, though only for a time, all those fine words and phrases in which she generally delights. A few of them have, however, in spite of her, crept into these tales. Thus we read that "the girl was inaugurated as a young lady." In another place we come across "the shimmer of a white garden-bonnet." A fire that has burnt low is "in a dilapidated state," and some young boatmen are going "to do the Severn, the Wye, and the Avon with a forced interlude of canals." Perhaps, however, the most absurd misuse of a word is in a passage where the author wishes to tell her readers that one of her stories is given in its wrong place. "In point of rotation," she says, "this paper ought to have appeared first." From the rotation of even the best of Johnny Ludlow's stories may a merciful heaven protect us. If we do for our criticisms deserve the punishment of Sisyphus, let it be stones, and not stories, that we must endlessly revolve.

RECENT TRAVELS IN JAPAN.*

(Second Notice.)

It is seldom that, within the limits of so small an empire as Japan, the social condition of one part differs so widely from the others as that of the country north of Tôkiô does from the southern provinces. From the capital to Kagoshima the country is like a garden; the people are contented and prosperous; and, under the civilizing influences of Western culture, all the political and social deformities which disfigured feudal Japan are fast disappearing. There is so much to attract attention and satisfy curiosity in this part of the country that travellers arriving at Tôkiô almost invariably turn, as by instinct, their faces southward; and, as nine out of ten write books of their travels, the belief has spread abroad, not unfostered by the Japanese themselves, that such as the southern provinces of Honshin are so is the northern half of the empire. Such an inference might possibly be drawn from Sir Edward Reed's book. The island of Yezo and its strange inhabitants, the "hairy Ainos," are barely mentioned in it; and of the long stretch of country extending nearly four hundred miles northward from Tôkiô we are told next to nothing.

It was into this untravelled region that Miss Bird, disregarding the attractions of the regular Japanese round, determined in the first instance to turn her steps. Accustomed to travellers of the more conventional order, the foreign residents at Tôkiô were taken by surprise at the idea of a lady venturing by herself on such unbeaten tracks; and with kindly intent wasted much time in trying to dissuade her from her purpose, by representing the possible danger of the enterprise, and the certainty of discomforts arising from "legions of fleas and miserable horses." As soon, however, as her necessary outfit had been completed, Miss Bird started on her way in a *jinri-ki-sha* drawn by two coolies. The rapidity with which this strange conveyance, which consists of a light perambulator body on two high slim wheels, with a pair of shafts, connected by a bar at the ends, into which the coolies harness themselves, has been adopted by the Japanese is a wonderful instance of their receptive power. It was invented seven years ago, and there are now 23,000 in use in one city alone! The first night's lodging at the "miserable-looking town" of Kasukabé might well have daunted a less adventurous spirit. The inn was crowded, and the noises were bewildering. On one side of her room was a man reciting Buddhist prayers in a high key far into the night; on the other side a girl was twanging a guitar; while "the house was full of talking and splashing, and drums and tomtoms were beaten outside." Privacy there was none; for throughout the night the sliding panels which constitute the walls of Japanese rooms were drawn aside, and pairs of "dark, elongated eyes" surveyed her through the chinks. That thieves did not enter through the same apertures was due only to the honesty of the people; and it is a noteworthy circumstance to be recorded of both the Japanese and the Ainos that, instead of having a single act of dishonesty with which to charge them, she found them on several occasions even unwilling to receive the gratuities she offered them for services done her.

Dishonesty is not a Japanese vice, and Miss Bird sums up the most noticeable failings of the people in the two words "truthlessness" and "licentiousness." Lying is in no sense regarded as shameful; and not only is immorality openly practised, but even the commonest decency is disregarded. Until quite lately, in the streets and elsewhere, coolies seldom troubled themselves with clothing of any kind; and now, as Miss Bird found, in the less civilized parts of the country, unless in the immediate neighbourhood of a police-station, the same practice still exists. The men who drew her *jinri-ki-sha*, and the boatmen who ferried her across rivers, were covered only with tatooed patterns. The Japanese, however, are by no means destitute of shame; a cowardly deed, or an act which, judged by their standard, is considered disgraceful, loads its perpetrator with a sense of ruined honour which more often than not makes life insupportable; and the following scene at Kurosawa, described by Miss Bird, shows that her native servant-boy Ito, though with "but little heart or any idea of any but vicious pleasures," was yet capable of feeling burning shame:—

> Children with scald-head, *scabies*, and sore eyes swarmed. Every woman carried a baby on her back, and every child who could stagger under one carried one too. Not one woman wore anything but cotton trousers. One woman reeled about "drunk and disorderly." Ito sat on a stone hiding his face with his hands, and when I asked him if he were ill, he replied, in a most lamentable voice, "I don't know what I am to do, I'm so ashamed for you to see such things."

But while such a natural display of wounded shame throws a ray of light over a dismal picture, another characteristic of modern growth is robbing some of the most lovely scenes in Japan of half their beauty. The sudden acquaintance with European religion and philosophy which followed on the conclusion of the foreign treaties has largely had the effect of destroying what little religion there was in the country, and has not as yet succeeded in supplying its place with any higher form of faith. The consequence is that the holy places are miserably neglected, and the priests themselves destroy all religious sentiment by the contempt they show for all that used to be held sacred. Nikkô, the shrine of the celebrated Shôgun Iyeyasu, is second to no place in Japan for the beauty of its natural scenery and the artistic gorgeousness of its temples. "Within, wealth and art have created a fairyland of gold and colour; without, nature, at her stateliest, has surrounded the great Shôgun's tomb with a pomp of mournful splendour." Here in days gone by two hundred Buddhist priests ministered with all the magnificent paraphernalia of their church before the grave of the illustrious dead; now "six Shintô priests alternately attend upon it as much for the purpose of selling tickets of admission as for any priestly duties. Then, at least in outward seeming, the grand figures of their gods were objects of reverence and living worship; but now all beauty but that of external form has disappeared; and the old priest who acted as guide to Miss Bird remarked to her, with a cynical disregard for his profession, "We used to believe in these things, but we don't now." Among the more highly-educated men the same want of faith which was exhibited by the Nikkô priest in his Shintô gods is extended to the creeds of all religions. "I asked," writes Miss Bird, "a highly-educated and thoughtful young Japanese, who had just returned from a course of some years of scientific study in America, if he had ever studied religion, and his answer embodies at least the view of the educated classes—'*No, I had no time for anything that had no practical bearing.*'"

Leaving the Nikkô shrine and its degenerate infidel guardians,

* *Japan; its History, Traditions, and Religions: with the Narrative of a Visit in 1879.* By Sir Edward J. Reed, K.C.B., M.P. 2 vols. London: John Murray. 1880.

Unbeaten Tracks in Japan: an Account of Travels in the Interior, including Visits to the Aborigines of Yezo and the Shrines of Nikkô and Isé. By Isabella L. Bird. 2 vols. London: John Murray. 1880.

Miss Bird struck northwards through a country in which nature has been profuse with her favours, but which is sorely disfigured by the dirt and squalor of the people. The houses are little more than huts, in which fowls, dogs, horses, and people herd together. The rafters and walls are black with smoke and dirt, and as at night every aperture is hermetically sealed up both in summer and winter, the state of the atmosphere of the interiors may be imagined. For the most part the men wear nothing but a cloth round the loins, and the women are unclothed to the waist. Possibly in this case scantiness of attire is not an unmixed evil, since their clothes, such as they are, are never washed, and are "constantly worn night and day, as long as they will hold together." These facts are abundantly sufficient to account for the prevalence, everywhere observable, of horrible skin diseases both among children and adults.

But the goal of Miss Bird's journey was Yezo, the northernmost island of the Japanese group. Though only separated from the main island of Japan by a narrow strait, and though its most northerly point is considerably south of the Land's End, "Yezo has a climate of singular severity, a heavy snowfall, and in its northern parts a Siberian winter." It contains an area of 35,739 square miles and a population of about 123,000, of whom 12,281 are Ainos. Much of the scenery is beautiful, and the geological features of the island are interesting, but the chief centre of attraction are the "hairy Ainos." Where these people came from originally has been much discussed, though there does not seem to be any reason to doubt that they are an offshoot of the hairy aboriginal race of central China mentioned by Chinese historians. The main peculiarity attaching to them is the heavy growth of thick hair on the chest and limbs, and which very often covers also the whole body. Miss Bird mentions having seen two boys whose backs were covered with fur as fine and soft as that of a cat. In form and features they are very unlike the Japanese. Their heads are well shaped, with high and prominent foreheads, and their faces are very striking. The eyes are large and "very beautiful, the colour a rich liquid brown, the expression singularly soft, and the eyelashes long, silky, and abundant." The physique is very powerful, and, writes Miss Bird, "after the yellow skins, the stiff horsehair, the feeble eyelids, the elongated eyes, the sloping eyebrows, the flat noses, the sunken chests, the Mongolian features, the puny physique, the shaky walk of the men, the restricted tottor of the women, and the general impression of degeneracy conveyed by the appearance of the Japanese, they make a very singular impression." But they are savages, or very little removed from being savages. They have neither history nor letters, and claim descent from a dog. Their clothes are made from the bark of trees and the untanned skins of animals. They are grossly ignorant, very dirty, and their objects of worship consist of the bear, the sun, the moon, fire, water, but principally the Japanese conqueror Yoshitsuné, because, as the tradition handed down for seven centuries tells them, he was kind to them. Though there is something unheroic, there is yet something touching, in this grateful recollection of mercy, and the scene witnessed by Miss Bird at a shrine at the edge of a cliff, when the chief drew back with great solemnity the sliding panels and displayed a male figure of their conqueror, before which he and his followers poured out libations and worshipped, throws a pathetic light over their history. They are a subdued people, stupid, gentle, and good-natured. Of the Japanese Government they live in abject terror, and would only consent to give Miss Bird any information about their social and religious habits on condition that she would not tell of them at Yedo. The men occupy themselves in hunting and fishing, and the women labour ceaselessly at their household duties.

Still, though they are savages, there is a kindliness and grace about them which is very charming, and their hospitality is boundless. On arriving at a halting-place, Miss Bird had no need to search for a lodging. The chief's house, where such existed, was, as a matter of course, her home during her stay, and thither she was invariably conducted by the owner, who, with many waves of his hands inwards, and strokings of his beard after the manner of their most respectful salutation, made signs to her to indicate that all that he had was at her disposal. Many days she spent in these hospitable though dirty houses, and she was thus able both to collect much direct information about the home lives of the people, and also to compile a valuable vocabulary of their language, which appears as an appendix to the present work. So many books of Japanese travel have appeared of late years, and the ground gone over has been so invariably the same, that we seldom close such a work without a feeling of relief. This is far, however, from being the case with *Unbeaten Tracks in Japan*, which contains a record of new and varied experiences told in singularly pure and bright English.

DE AMICIS ON HOLLAND.*

IT appears to us that for a century past no books have been issued from the English press in so slovenly and disgraceful a condition as some of the cheap volumes of the present day. We grow weary of protesting against ignorant work, ignorantly revised, and teeming with the blunders of authors, printers, and readers. But the work before us is prepared in so extraordinary a manner, and with so exceptional a profusion of blunders, that it deserves to be signalized among the bad class to which it belongs. It is so full of mistakes as to be often quite unintelligible, and these mistakes are divided in a very curious way between a variety of persons. In the first place, Signor de Amicis is a lively and entertaining writer of very considerable literary merit, but not remarkable for accuracy. His book is translated by a lady who knows Italian pretty well, but is marvellously ignorant—we do not say of Dutch, for most of us are that—but of geography and history and fine art. She manages to commit a host of fresh errors on this score, and then the unfortunate book passes into the hands of compositors and readers who seem to be singular among their diabolical race for ingenuity of mischief. The result is a book that no one who cares for his library will tolerate on his shelves for a moment.

We have found it impossible to review this English version without arming ourselves with the Italian original. Amid the thousand and one mistakes, it was impossible, without collation, to distinguish between those at first hand and those at second hand. The *Olanda* of Signor Edmondo de Amicis is, like the other productions of its versatile author, light, bright, and picturesque. The author's matter is neither very new nor very deep; but his manner is easy, and wants only a little more self-respect to become distinguished. His sentences rattle on; but they are elegant and harmonious in their speed, and he rarely commits a fault against good writing. At the same time, he is essentially a journalist, and his books have the faults that attend the too exclusive practice of journalism. It is impossible not to read them, and yet the reading is attended with the minimum of ultimate satisfaction. With his faults and his merits, he approaches nearer to the late Mr. Hepworth Dixon than any other writer with whom we are acquainted. To such a man occasional error in detail is inevitable. In the fifth edition of *Olanda*, which lies before us, although specially "riveduta dall' Autore," we find the Dutch name for the Hague given as S'Gravenhage, instead of 's Gravenhage, and that for Flushing, Flessingnen, instead of Vlissingen. He finds, also, that Dutch proper names present some difficulty; and the poetess Tesselschade appears as Tesseeschave, and Mme. Bosboom as Rosboon. But these trifling errors fade into nothingness by the side of the translator's glorious determination to be wrong. When De Amicis has made a little mistake, such as writing Veenix for Weenix, she goes further, and makes Veenir of it. But most frequently she leaves him far behind, and explores new provinces of her own. She gives the name of the painter of "the famous four-candle picture"—as she clumsily translates a sprightly phrase of De Amicis—under the strange disguise of Gerard Don, a mistake which recurs on page after page. Whenever several painters are mentioned, one name or more is sure to be incorrectly spelt. Hobbema appears as Hoffema, Snyders as Luyders, Berghem as Berghun, Karel du Jardin as der Jardin. The names of famous writers are given in the same style. Vandal represents Vondel, Van Leunep is printed in every case instead of Van Lennep, Genestol instead of Genestet, and Ten Briuck for Ten Brink. Even in geography the same traps beset our footsteps everywhere. We have Wlardingen for Vlaardingen, Ratwijk for Katwijk, Zuften for Zütphen, Gonda for Gouda, and Delph for Delft. Leuwarde, repeated some dozens of times, is meant for Leeuwarden, and this is a case in which Signor de Amicis has been blindly followed; and so, we are sorry to say, is the misnomer Théophile Gauthier. An idea of the general intelligence of the translator may be given by the fact that Italian words are introduced into the text, as though to give it a local colour; and so, in an English book about Holland, we are told of Dutch gentlemen who say *Che?* of a *palazzetto* in the woods at the Hague, and of the *canzoni* of Vondel. But perhaps the skill of the translator is best shown in the treatment of that curious national conveyance, the canal-boat, which never fails to excite the interest of foreigners. De Amicis, having once learned to spell *trekschuit* correctly, glories in his acquisition, and repeats it again and again. In following him, Mrs. Tilton does not once succeed in reproducing this proper form of the word, but wavers between *trekschuyt*, *treckshuyt*, *treckschuyt*, and *treschknit*. After this, such eccentricities in English as "a tablet for *scratching* matches," and in Italian as "Mie Prigaoni," seem merely in sympathy with the general tenour of the volume. We repeat that we have never met with a piece of hack-work so badly executed as the translation before us.

It was needless to publish any version in English of this bright little book of Signor De Amicis. The Italians are not a travelling people, and the *Olanda* was well calculated to teach them for the first time things more or less known to every educated Englishman. Books on the topography and manners of modern Holland are a drug in the English publishing market, and the name of a distinguished Italian could scarcely be sufficient to float another such volume, even if the style did justice to its original. Both England and France have of late expended real study on the peculiar civilization of the wonderful little country formed, as Napoleon said in his wrath, of the washings of a few French rivers. The most penetrative studies of Dutch art existing are written in French, and the history and literature of Holland have received from several hands in England a study unrivalled for minute care among the Dutch themselves, who freely confess that our historians have mastered their history better than they themselves. To a reader who has taken the trouble to read Motley and his successors, grave and gay, the work of Signor De Amicis presents nothing new except a few anecdotes and one or two picturesque impressions. He was charmed with the country, amused with the people, and keenly observant of all that was quaint or unusual. He went intending

* *Holland.* By Edmondo de Amicis. Translated from the Italian by Caroline Tilton. London: Allen & Co.

pleased, and he thoroughly succeeded. His notes are as superior in their vivacity and colour to those of the ordinary as they are inferior to such veritable masterpieces of local ...ations as the *Sweden* of Hans Andersen or the *Constantinople* Théophile Gautier. He is unable to understand the serious of the national character; his remarks about the Lutheran ...ion and the minor morals of the Dutch are almost grotesquely inadequate; and he lapses too often into a coarseness which makes the English version occasionally offensive, although the translator has avoided the most disagreeable phrases and passages. But when he is merely vivacious his book is very pleasant reading, in spite of its lack of originality. He is not above telling a good story at his own expense. Such is the anecdote of the result of his trying to impress a grave young Frisian gentleman of Harlingen by his grandiloquence. He talked of his ancestors, and told the youth to consider him as a Roman of the days of Tiberius. The Frisian, without the least embarrassment, began quoting Tacitus in Latin, and soon brought Signor de Amicis, if we may employ so colloquial an expression, down upon his marrow-bones. But on his way to Groningen our traveller fell in with a still more surprising personage, a peasant who had never been further than Amsterdam, and who had never seen a hill in his life, but who talked French, knew what steps the Italian Parliament was taking with regard to compulsory education, and closed the interview by repeating, in laboured accents, the first lines of Dante's *Purgatorio*. Signor de Amicis, whose account of Friesland is by far the freshest and most amusing part of his volume, could never accustom himself to the mixture of remoteness and civilization which he found in that province. He was afraid, at last, of speaking lightly to workmen in the street, lest they should turn round and address him in Latin or in classic Tuscan. He gives an amusing account of a wedding at Leeuwarden, and closes it with a characteristic sentence, which the English translator renders thus:—

For myself, I looked about for some handsome Frisian woman, and when I found her, she shot me a glance full of pride and defiance, after which I entered into conversation with a bookseller, always a very agreeable thing in Holland.

We look in vain for an explanation of the closing sentence; if our readers care to turn to the passage in the Italian, they will find the difficulty vanish. But the style of Mrs. Tilton is inexhaustible in its surprises.

The notes of the Italian traveller on art are generally acute and often picturesque. In the presence of Rembrandt he "raises the key of his style," as he puts it, and is lyrical for three consecutive pages. His criticism of pictures is always too ebullient, and he distinctly belongs to the same school as the connoisseur who said that Gerhard Douw painted with the eyelash of a new-born baby. But he has given considerable attention to the subject, and may be more safely trusted in it than on the kindred topic of literature. He says a good deal about Dutch poetry, and makes one epigram which is worth quoting—"Altre letterature sono grandi pianto vestite di fiori odorosi; la letteratura olandese è un piccolo albero carico di frutti"; but this seems to be rather a happy guess than the result of independent study. He gives a long account of Vondel and his career which is full of inaccuracies. It is entirely erroneous to say that Vondel enjoyed fame as a poet at the age of fifteen. He was twenty-five, and totally obscure, when his first work, *Het Pascha*, was published in 1612. It is no less curious a blunder to say that his first tragedy was a *Destruction of Jerusalem*. The masterpiece of Dutch drama *Gijsbrecht van Aemstel* is concealed under the spelling *Gilbert d'Amstel*, and the analysis of the *Lucifer* is full and specious, but not worded as it would be by a man who had really read that tragedy. The facts of the close of Vondel's life are all misstated, and we may easily gather from such an account of the greatest of Dutch writers that Signor de Amicis is not sound on Dutch literature as a whole.

THE CROOKIT MEG.*

To write a good local novel, racy of the flavour of the soil, that shall at the same time be intelligible and acceptable to the general reader, is a feat by no means easy of achievement; but in this case we may congratulate Mr. Skelton on a success. Possibly we may have been predisposed in favour of the book, since we happen to be familiar with the district which he has faithfully and graphically described. But we have done our best to judge the story dispassionately, and we have found in it many of the qualities that make a fascinating work of fiction of its class. There are life-like pictures of society and manners; there are realistic sketches of scenery; there is an abundance of stirring incident eminently characteristic of the times, while there is enough of love-making to recommend the volume to the sympathies of sentimental votaries of the tender passion. Nor has Mr. Skelton fallen into the snare, so seductive to fervent Scotchmen, of overloading his pages with the dialect of the country, although he marks the people unmistakably for those who know them. Stories like *The Crookit Meg* are archæological as well as romantic, and should have a certain permanent value in addition to their ephemeral interest. For ancient landmarks are being swiftly effaced; the types of a half-forgotten society have been steadily dying out; and the Scottish language, as it used to be spoken by dignified and well-born provincials, is likely very soon to be a thing of the past.

Mr. Skelton's "Year One" is the first year of this present century; and when we say that the *Crookit Meg* was the name of a smuggling cutter, we give an idea at once of his plot and his subject. The thriving little town of Peelboro', in whose immediate neighbourhood the interest centres, will be easily identified with Peterhead, a seaport on the coast of Buchan, which is one of the most poverty-stricken divisions of Aberdeenshire. Peterhead or Peelboro' has for long been a famous seat of the whale fishery, and Mr. Skelton's story opens appropriately and dramatically with the arrival of the *Jan Mayen* in the harbour, amid the intense excitement of the population. The size of the *Jan Mayen*, by the way—she was a small schooner of but 100 tons—takes us back at once over three-quarters of a century. Since the Year One the whaling trade has grown, declined, and revived, till now it is carried on entirely by screw steamers. And there have been many other changes as well. Smuggling then was very much a matter of amicable and neighbourly arrangement. The "preventive men" did their duty on occasion, no doubt, seizing a cargo when they had the opportunity. But, as a rule, they were quite content to wink at the universal traffic in contraband goods; and it was notorious that each loyal citizen in the borough, and each respectable farmer within easy reach of it, was open to a bargain in tens and spirits that had never paid a shilling to the Exchequer. So the hero of this tale of *The Crookit Meg* is a certain Alister Ross, a handsome and manly young coastguardsman; while Eppie Holdfast, the coquettish and bewitching young heroine, is connected with the "fair traders" through a scapegrace brother, who has run from his home to find a berth in the smuggling cutter. That Eppie plays fast and loose with Alister, scarcely knowing whether she really cares for him or not, is a matter of course. That she compromises herself with another man of higher station and dissipated habits is not unnatural, considering her light-hearted vanity and the liberty allowed her by the manners of the country. And there is a most tragic scene, where she is brought to understand her feelings when it is too late, by circumstances that falsely convict her of treachery to the lover to whom she is on the point of relenting. As we see the pair first, they form a pretty tableau, and a very probable one. It is a Sunday afternoon, when Eppie is expecting Alister; and, in the flood of softening feelings and associations, her heart is melting to him with unfamiliar tenderness. Shy and diffident as he is, the instincts of his affection tell him that she is changed. She has been summoned from the room for a moment, and he is only waiting her return to clasp her to his bosom in the assurance of her assent, when a stone is thrown through the window, and attached to it is a scrap of writing. He picks it up and reads in a tremulous reaction of feeling. The scrawl is worded in terms of familiar endearment, and bids Eppie detain the "gauger" by hook or crook. He fancies he understands it all; yet he only understands half. No doubt Eppie's imprudence had given her disreputable correspondent some right to address her with that compromising familiarity. But, after all, she had flirted no more than many a rustic maiden of her years and standing who had afterwards married elsewhere and made an excellent wife. Now she would have given all in the world to persuade Alister that her choice has been made at last, and that she is not unworthy of his devotion. But the unhappy *contretemps* is not to be explained away, and her lover's faith is not only shaken but shivered. From that eventful meeting their paths are forced apart; and after adventures that end somewhat better than she had a right to expect, Eppie is left to repent her folly at her leisure.

The love tale in *The Crookit Meg* is pretty and pathetic; but, although the thread of it runs more or less through the book, it is nevertheless but of secondary importance. The chief charms are in the variety and truthful originality of the subordinate characters and the freshness and fidelity of the descriptions of scenery. Indeed Mr. Skelton has taken care to assure the realism of his work by blending the actual with the ideal beyond ordinary powers of discrimination. Those of his readers who know the neighbourhood best will be puzzled to say where the topography of the Ordnance surveyor "marches" with the regions of fiction. We hear of the Point of Rattray, of Lord Errol's Castle of Slaines, of the old tower of Udney, &c., all places which are to be discovered in maps and guide-books; and, for aught we know, the names of the farmsteadings and hamlets may be equally veracious. So with the notables of the borough and the lairds and farmers. More than one of these worthy gentlemen have really flourished, as we happen to be aware, and in something more than merely local notoriety; while others, if they have not actually lived in the flesh, ought to have done so, so suggestive are they of the types of which they stand as representatives. There is the Provost, Roderick Black, silent, shrewd, upright according to his lights, energetic, and much addicted to snuff; the very incarnation of a "douce" provincial magistrate, who keeps a close eye upon public affairs, but by no means objects to seasonable recreation. Indeed, when we make the acquaintance of the Provost and his cronies, they are assembled at the worthy magistrate's house to indulge in a supper, with rubbers to follow. Each of the other three is, in his way, a representative man. There is Captain Knock, commander of the Coastguard, who has reconciled the discharge of his duty with a fair amount of popularity. There is Mr. Corbie, the borough lawyer, handicapped in his calling by his weakness for "a tumbler"; but who,

* *The Crookit Meg; a Story of the Year One.* By John Skelton, Author of the "Essays of Shirley." London: Longmans & Co. 1880.

drunk or sober, is invariably sharp, and the depository of all the law secrets of the neighbourhood. And last, and the most remarkable of the sociable group, there is Dr. Caldcail, the minister of the parish. Dr. Caldcail, as his name implies to a Scotchman, is a divine who is more learned and doctrinal than soul-stirring. But, if his pulpit ministrations fall flat on his flock, on the other hand he prides himself on his successes in society. He has travelled abroad as tutor to the peer who became his patron. He has visited the France of revolutionary ideas and easy morals, and has come back with a liberal creed, a sharpened wit, and polished manners. And so the Doctor becomes a welcome guest in the houses of the greater landed proprietors, while he continually asserts his superiority to his ordinary associates, though occasionally he meets his match in repartee.

But most characteristic perhaps of all the characters is Adam Meldrum, a man who, as Mr. Skelton observes, could not have been bred out of Scotland. Adam has refined his mind and braced his quick intellectual powers in an intimate acquaintance with some of the grand lights of literature. He has steeped his soul in Shakspeare and in close communing with nature. Though no misanthrope, he lives a life of loneliness; but in his admiration of the varied handiwork of nature, he has educated himself into one of "the saints of science":—

> To Adam nature was simply the expression of that complaisant activity of which the sea was one aspect, and the Old Testament another, and Shakspeare another, and a rare fern and the skilful mechanism of a seabird's wing another and another. Throughout the whole of a universe in which each part was thus vitally related to the rest, there was nothing common or unclean; the freshness of nature never diminished; each dawn and each sunset touched him with a new joy.

There was a time when a man like the eccentric Adam might have been called to "compear" before the Kirk Session for his strange speech and "uncanny" habits. In the present day the minister of the parish would have felt almost bound to keep him at arm's length or to try to convert him to more orthodox ideas. But the Erastian and somewhat worldly Dr. Caldcail understood, sympathized, chatted, and delighted in associating with him. Between the two men there was a certain affinity of literary tastes, with common tendencies towards broad theological speculation. Their conversations, in which we recognize the promptings of the essayist Shirley, are among the best things in the volume. Mr. Skelton ingeniously makes Meldrum's sensibilities the vehicle for his own poetical appreciation of scenery that is sternly attractive rather than beautiful, although it is softened to those who have fallen in love with it by its special charms. Those "seaward" parishes, as they are called, are among the very bleakest districts in Scotland. We hear of a farmhouse standing on the summit of the lofty cliffs, where the windows in a winter storm are whitened with the drifting sea foam. "No tree can take root on that inclement seaboard; the alder bushes where they rise above the garden wall are cut across as by a knife." But, descending into the chasms that have been torn into the land, we are made to enter "a world of romance and mystery, of light and shade, of stern strength and tender beauty, where the measured beat of the wave and the sorrowful complaint of the seamew only add to the impressive solitariness of the scene." We are led along winding and break-neck paths, among boulders, bubbling springs, and banks of ferns and primroses, where "the blue sea and the white sea-birds are framed in every variety of green." And though Buchan lies beyond the ordinary beat of the tourist, and though Mr. Skelton paints it with its deformities as well as its beauties, we can imagine admirers of *The Crookit Meg* being tempted on a pilgrimage to the scenes of his adventures.

SANDYS'S *BACCHÆ* OF EURIPIDES.*

In many respects the *Bacchæ* is one of the best, as it is also one of the latest, plays of Euripides; and it is worthy of special note as being the author's recantation, at the close of his life, of the sophistic scepticism of his earlier years. It is a wonderfully pictorial play; the stage is kept constantly alive with varied action, never flagging except once where a lull precedes a stirring catastrophe; and the drama itself is entitled to high praise for its combination of those elements of action, dialogue, and surroundings which go to constitute a successful play. Of the present edition of the *Bacchæ* by Mr. Sandys we may safely say that never before has a Greek play, in England at least, had fuller justice done to its criticism, interpretation, and archæological illustration, whether for the young student or the more advanced scholar. The Cambridge Public Orator may be said to have taken the lead in issuing a complete edition of a Greek play, which is destined perhaps to gain redoubled favour now that the study of ancient monuments has been applied to its illustration. As is observed at length in the learned introduction

> The conclusions we are able to draw from historical and archæological literature with regard to the actual rites of Dionysus as practised in Greece are in many respects inconsistent with what might be deduced from the representations of the Mænads which are to be found in Mythology and Art. The latter is an imaginative picture, which is portrayed for us not in prose, but in poetry; and the finest example of its poetic treatment is the play now before us. It is this that warrants the attempt which is made in this volume to set one form of the imaginative treatment of the legend of Dionysus by the side of another, and, in this particular point, to illustrate the poetry of the Greek drama by means of the sculpture and painting of Greek art.

Not indeed that Mr. Sandys spares any pains in the literary perfecting of his work. Beginning with the earlier legends of Dionysus, he cites Pausanias in his introduction for the existence of temples and statues of that God at Athens, where "are pictures representing Pentheus and Lycurgus being punished for the wrongs they had done to Dionysus"; and he notes the clamour of the populace, discontented with the introduction of other heroes than the favourite God of Tragedy, expressed in the proverbial outcry τί ταῦτα πρὸς τὸν Διόνυσον. He also examines the tetralogy and trilogy of Æschylus as to Lycurgus and Pentheus, as far as their extant fragments allow, and shares Milman's regret for "a loss in these Æschylean tragedies to be deplored more than any of the poet's works, except perhaps his *Niobe*." A not uninteresting part of the introduction concerns "Euripides in Macedonia," where he visited first Magnesia, and was received with special distinction, and thence proceeded to the court of Archelaus. Mr. Sandys cites from the *Gorgias* Socrates's reasons for declining an invitation to that usurper's court; but it must be owned that the monarch governed well the kingdom he had won by crime, that he was a great administrator, and a distinguished patron of art and literature. In goodly company with poets, painters, and dithyrambists, Euripides here composed a play to which he gave the name of his patron, and here also he either wrote his *Bacchæ* or gave it its final touches. So at least Mr. Sandys infers from its complimentary references to the haunt of the Muses in Pieria, part of the King's dominions; to the hallowed slope of Olympus (vv. 409–15); to the swift stream of Axius (568), which eventually becomes the principal river of Macedonia itself, and finds its way into the Mediterranean, at the head of the Gulf of Therma. In terms of praise, too, is mentioned the less important "Loidias" (571), one of whose tributaries rises near the ancient Macedonian capital, Ægæ, where, as Mr. Sandys thinks, Euripides is more likely to have died than at Pella, the later capital. As is shown in a note, the evidence for Pella rests mainly on a late and anonymous epigram.

As regards the putting of this drama on the stage, we may say that never before in any edition of a Greek play were such technical details given as to costume and properties as we find in Mr. Sandys's *Bacchæ*. In the introduction we have minute directions for the disguise of Dionysus as one of his own votaries, as leader of the revel-band chorus, holding the thyrsus, ringleted in neck, and in all respects womanish or θηλύμορφος. Otherwise he is arrayed like the rest of the God's retinue, ivy-crowned, the fillet on his brow, the panther skin across his chest, a long striped tunic reaching to the ground, a loose upper robe above. When at the close of the play he reveals his godhead, it is in his conventional stage attire—a long saffron robe bound about the breast with a broad girdle of saffron hue. With like minuteness we are enabled to trace the dress of the Bacchanals, of Teiresias the soothsayer in netlike woollen robe, with the Bacchic fawn skin over it, the ivy crown having been donned instead of the prophet's chaplet, and, in place of the laurelled staff of Apollo's seer, the thyrsus swathed with ivy. This, of course, betokens that he has accepted the worship of Dionysus, as Cadmus, who is similarly dressed, has done also. To name one other character; Pentheus is represented in p. l., scene 2, with diadem and sceptre, and a purple *xystis* over a bright *chiton*. His youth is indicated by an appropriate mask, and dignity is added to it by the elevated frontlet called the ὄγκος. So much for the dresses. As for the scene throughout the play, Mr. Sandys explains that it is laid before Pentheus's palace in the Cadmeia, the citadel of Thebes, in the northern part of the town, the direction furthest removed from the Bacchic revel on Cithæron. At each extremity of the stage was the *periactos*, a mechanical contrivance—that on the spectator's left conventionally indicating the road to foreign distant parts; that on the right showing the way to the town and to Cithæron, which would be reached by going through it and leaving it by the Electran gates. For all minor stage directions the introduction will be found sufficient; and, indeed, the outline of the play and the study of its *dramatis personæ* are so careful and lucid as to obviate any perceptible difficulty. Mr. Sandys remarks (p. lxvii.) that the choral metres enhance the impression of the varied emotions of the votaries of Bacchus, and he illustrates this by a Trochaic passage, 604–41, marking a transition from the hurried excitement of the preceding scene to the quieter Iambics which follow. Many of these last have a large number of resolved feet in the poet's later manner. Another point well worked out is the close connexion of the choral odes, as in the *Iphigeneia in Aulis*, with the action of the play. Thus the references in the first stasimon to the places where Dionysus is worshipped find an echo in the reference to the God's haunts in the second. The longing for liberty in the second is in like manner caught up in the third, and the moral reflections of the first are to some extent repeated in the last. As distinct from the choruses, the two Messengers' speeches have ever been esteemed the gems of this play—passages in which the revels on Cithæron and the death of Pentheus are narrated with a brilliancy, swiftness, and vivid representation of rapid incident unsurpassed in Greek tragedy. Mr. Sandys happily remarks, in pp. lxviii.–lxx. of his introduction, on the skill with which the Second Messenger leads up, with wonderful dramatic effect, through the tranquillizing scenery of Cithæron and

* *The Bacchæ of Euripides.* With Critical and Explanatory Notes, and with numerous Illustrations from Works of Ancient Art. By John Edwin Sandys, M.A., Fellow and Tutor of St. John's College, Cambridge, and Public Orator of the University of Cambridge. Cambridge: University Press. 1880.

its pine groves, to the deed of horror that is soon to follow. He notes similar instances of repose in Goethe's *Faust*, and again in the dialogue between Duncan and Banquo as they near Macbeth's castle, where the quiet and easy conversation rests the mind in contrast to the horror which is to follow. We can hardly endorse Humboldt's eulogy of the whole of this speech of the Second Messenger as "a description of scenery disclosing a deep feeling for nature," as there is but a line and a half to illustrate it. The poet was necessarily limited to a few clear and vivid touches; but, as Mr. Sandys justly says, "as a vigorous and rapid narrative, displaying great powers of clear and graphic description, it would be hard to find his rival."

It is time, however, that we should speak of the critical and explanatory part of this elaborate edition. In the prologue, 24-5, where the disguised Dionysus describes his raising his revel shout at Thebes before any other place in Greece, he is careful to observe that it is after donning the fawn-skin, *νεβρίδ' ἐξάψας χρόος* (*αὐτῶν* sc., *i.e.* the Theban women); and a learned art note illustrates the mode in which the fawn-skin over one shoulder and athwart the chest marked the God and his female votaries. In the next line another attribute is signified by the placing a thyrsus in their hands, where the words in apposition, *κίσσινον βέλος*, represent almost certainly a true restoration of the original text. Mr. Tyrrell's *Κίσσινον* is "nil ad rem"; both MSS. read *μέλος*, for which H. Stephens coined what was perhaps the true reading. For *κίσσινον βέλος* is an apt instance of the class of limiting or restrictive epithets, like *πτηνὸς κύων*, in all of which the metaphorical use of the substantive is made possible by the adjective attached. Thus here the weak wand wielded by the God's votaries is described as a weapon, "not of war," but "wreathed with ivy," just as, in v. 1104 below, *ῥίζας ἀνεσπάρασσον ἀσιδήροις μοχλοῖς* means, "At last they strove by riving oaken boughs to uptear the roots with bars—but not of iron. On such epithets Mr. Sandys cites Cope on Arist. *Rhet*. III. 6, § 7. For the confusion of the characters β and μ in cursive MSS. he shows an apt parallel in v. 678. Another casual point on which he has reflected curious light is the identification of the substantive in the phrase *χλοήρει μίλακι καλλικάρπῳ* with the "smilax aspera" of Sibthorp and the Black Bryony of our own flora, which is really named from the same verb, *βρύειν*, which the chorus here uses of the *μίλαξ* (v. 107-8). The lines beginning "Burst forth, burst forth with the green bright-berried bryony" seem to call up the plant which Mr. Hotham met in the roadsides of the Riviera rather than the common bindweed or convolvulus for which Liddell and Scott took it, or than the berried yew, as conjectured by Mr. Paley, which, says Mr. Sandys, was regarded as poison by the ancients, and would not lend itself to wreath-twining so easily as bryony, or be so attractive to the merry bacchants. A little further on, at vv. 111, *στικτῶν τ' ἐνδυτὰ νεβρίδων στέφετε λευκοτρίχων πλοκάμων μαλλοῖς* is translated, "Fringe thy livery of dappled fawnskins with woolly tufts of silvery tresses"; and Mr. Sandys holds that there is no need to strain *στέφετε* so as to represent the fawnskins as studded with artificial tufts, it being enough to understand "fringing" or "trimming," *μαλλοῖς* being a metaphor for bunches of hair, and *λευκοτρίχων πλοκάμων* an ornamental phrase for the tufts of hair which the Bacchæ may have taken to trim their fawn-skins from the goats killed by them in the chase. On the famous line 367, *Πενθεὺς δ' ὅπως μὴ πένθος εἰσοίσει δόμοις τοῖς σοῖσι Κάδμε*, we have Mr. Sandys's own idea of a felicitous rendering, which is certainly preferable to Dr. Donaldson's "Penthouse"—"Beware lest Pentheus bring into thine house his namesake Sorrow"; and he multiplies from the three great dramatists similar plays on words, or rather plays on names significant of the destiny of the bearer, and therefore of tragic interest. Here, too, he uses his reading and editing of Cope's *Rhet*. ii. 23-29 to good purpose, and makes us wish that that work might come into wider use. A little below, at 394, *τό τε μὴ θνητὰ φρονεῖν βραχὺς αἰών*, Mr. Sandys adduces cogent reasons for omitting the full stop adopted by most editors at *φρονεῖν*. There is, however, annotatory matter of vital interest at every turn of this most interesting drama. It is a curious addition to the literary interest of this new edition that it has had the advantage of the marginal notes written by Milton in his copy of Euripides, published by Paul Stephens at Geneva in 1602, and bought by him in 1634, the year he wrote his *Comus*. Classical readers may with advantage con their Miltons for parallels from the *Bacchæ*, at the same time that they examine vigilantly the scholarlike emendations of the great English poet.

MINOR NOTICES.

MR. LEATHES, who has lately resumed his old part of Laertes to Mr. Edwin Booth's Hamlet, gives to his volume *An Actor Abroad* (1) the alternative and appropriate title of "Gossip, Dramatic, Narrative, and Descriptive, from the Recollections of an Actor in Australia, New Zealand, the Sandwich Islands, California, Nevada, Central America, and New York"; and it will thus be seen at once that the writer had plenty of experience to draw upon. Out of this he has given us an eminently readable book which is not the less attractive for containing less theatrical "shop" than its first title might suggest. We learn in the first page that he has relied entirely on his memory for the account he gives of the many interesting scenes and events through which he passed, and the well-told stories which he picked up in the course of his travels, and now reproduces. Among the most curious of Mr. Leathes's theatrical experiences was his appearance at Honolulu with Miss C——, a celebrated actress, in selected scenes. Four performances were given, the last being by Royal command, and on this occasion several scenes were given from *Hamlet*, Miss C—— playing the Prince, and Mr. Leathes appearing by turns as Horatio, the Ghost, Rosencrantz, and the Player. On another occasion the author appeared as Cardinal Wolsey. He happened to have with him a complete and accurate costume for the part, but a wig was wanting, and the difficulty was got over by Miss C——'s suggestion that he should arrange and wear her Lady Teazle wig. They had also strange difficulties, which are brightly and humorously described, as to the music which is considered a necessary part of most dramatic entertainments; but these and all other drawbacks were overcome, and the performances seem to have been triumphantly successful, although Mr. Leathes, with a commendable reticence which is observable throughout his work, says very little as to his own share in the success. However, the chief attraction, as may be guessed from what we have already said, of Mr. Leathes's book lies, not in what he has to tell us of the stage, but in his pleasant and unforced account of what he saw and heard as a traveller who happened to be an actor. He sometimes gives us what may seem to be superfluous details; but he has the great merit of being never dull, and it is probably because he has not hesitated to put down everything which dwelt in his memory after some years with regard to his tour, that his writing preserves a vividness which a fastidious criticism as to the relative importance of events might probably have removed. He has the power of telling a story clearly and pointedly without any fussy insistence on its points, and the life-likeness of his descriptions may be judged from his account of an earthquake shock which he felt at San Francisco. He was sitting in the wooden house inhabited by a brother actor and his wife, playing a quiet game of cassino, when he heard a noise like that of a heavily-laden waggon passing, followed by a violent shaking of the window. Mr. Mestayer, the owner of the house, who had been in a worse earthquake before, "cried, 'Earthquake—sit still!' His face turned perfectly livid (he afterwards said that mine was gamboge); his wife sat still, crying, 'Willie! oh Willie!' The cards were thrown on the table, and we sat waiting the crisis." The timbers of the house creaked, and there was a gently undulating movement of the earth, followed by the far more dangerous "shake," which the author describes as suggesting the notion that the whole house was in the grasp of a giant. The whole description is too long to quote, but it conveys an impression, the more striking from its simplicity, of the awe of utter helplessness which an earthquake produces, even more perhaps in those who know by previous experience what it means than in people to whom it is a new experience. In Virginia City and elsewhere Mr. Leathes saw some deadly "shooting affrays"; and in San Francisco he was saved from being mixed up in one himself by his presence of mind and prompt intimation of his readiness to draw his own "shooting-iron." His record of this and similar scenes is strangely and deplorably paralleled by recent reports of assize and police cases in England, where the terrible fashion of carrying loaded revolvers seems to be so much on the increase as to call for some remedy more potent even than the wise observations of a judge which were reported two days ago. *An Actor Abroad* is a bright and pleasant volume; but Mr. Leathes will do well in any future work to correct his proofs more carefully. "A famous entymologist" (p. 155) is a kind of creature as yet unaccounted for.

We have on former occasions noticed some of the tables prepared by various workers under Mr. Herbert Spencer's direction, and according to an elaborate plan of classification laid out by him, which bear the general name of *Descriptive Sociology*. A new folio has appeared this summer, dealing with Hebrew and Phœnician civilization (2). No pains appear to have been spared in collecting the materials from the best authorities; and we have no doubt that, as a collection of facts, the result is substantially trustworthy. But we cannot help entertaining great doubt whether the unwieldy size and form of the book, and the artificial and unfamiliar arrangement of the matter, will not prevent it from being of much use to anybody besides Mr. Herbert Spencer himself.

The third volume of the complete edition of Mr. Bret Harte's writings (3) contains several of his best stories, among them "Mrs. Skaggs's Husbands," "An Episode of Fiddletown," and "Roger Catron's Friend." A story, new to us, which is called "A Passage in the Life of Mr. John Oakhurst," seems to us to be below the author's usual mark. One has by this time heard a good deal of Mr. John Oakhurst and of other characters who differ from him only in name, and it is possible to have enough of a good thing. Apart from this the scope and aim of this particular sketch are not well chosen. Mrs. Decker is a character which wants life and novelty, and the story itself is at best just such a commonplace tale of adultery as might be devised by any one well up in the works of Feydeau. Among the shorter sketches

(1) *An Actor Abroad*. By Edmund Leathes. London: Hurst & Blackett.

(3) *The Complete Works of Bret Harte*. Collected and revised by the Author. Vol. III. London: Chatto & Windus.

which appear in the volume, one of the best, and also one of the best things in its line that Mr. Bret Harte has written, is "A Sleeping-Car Experience."

There is a good deal of entertainment to be got from Mr. Wale's brief autobiography (4), which is pleasantly and commendably free from any kind of affectation. Mr. Wale was in 1845 appointed a cornet in the 15th Hussars, and departed for the East Indies on board a P. and O. boat, the life on which he describes as remarkably pleasant and luxurious. "But what would you think," he adds, "if at the present day on board the steward were to come to your cabin the first thing in the morning saying, 'Brandy-and-soda, sir?'" When the author arrived at Cairo, the Pasha was building a mosque by forced labour, and he describes how he saw "men, women, and children staggering under the weight of large stones they carried on their heads, and the taskmasters urging them on with whips made of rhinoceros hide." The life in India after he had joined his regiment Mr. Wale describes as "truly delightful," in spite of various drawbacks. The treatment of native servants by their English masters which was then common would, he says, "rather astonish the present generation." He states how he has known a man send his "head boy" to a cantonment magistrate bearing a note informing the magistrate that "the bearer has given me no end of trouble lately," and asking him to "kindly give him a dozen." Mr. Wale adds that no doubt in most cases the bearer richly deserved what he got. With his own servant his experience was somewhat curious. After he had been engaged a few days he came in and informed his master that "Massa too much foolish man." He then explained that, as things were at present arranged, Mr. Wale was cheated by every one with whom he dealt, and, with admirable *naïveté*, proposed a simple way of avoiding this in future. "I tell you what, Massa. You give me all de money. I go to the bazaar, and buy Massa's things. I cheat Massa; that one person cheat Massa; then I take good care no one else cheat Massa. That good business." To this arrangement Mr. Wale consented at once, with the result that the man served him well and faithfully throughout his engagement. It is curious at this date to read the description of the regimental dress, or rather dresses, of the time with which Mr. Wale deals, recalling as it does a well-known passage in Thackeray's account of a visit to Major Ponto; but, indeed, the whole of this part of the book is full of interest as an apparently faithful description of a past state of things. Not less interesting in their way are the author's experiences in the Crimea, and, after he left the army to take holy orders, in a country parish. The book is, in short, one which contains much pleasant reading.

Mr. Thomson (5) has added one more to the volumes written in order to prove that the plays and poems usually attributed to Shakspeare were really the work of Bacon. The ingenuity and industry with which he has collated parallel passages from Bacon and Shakespeare which appear to him conclusive as to the identity of the two writers, are remarkable; and it is hardly necessary to add that so is his persistent and skilful avoidance of everything which tells against his theory. It may be convenient to take the treatment of what is probably the best known of Shakspeare's plays as an example of Mr. Thomson's method. He says of *Hamlet*:—"If the proper part of dramatic allegory be to hold a mirror up to nature, the political playwright will naturally turn his theatre reflector towards the leading good or profligate feature of the time. Hence, for example, when queen-empoisoning *Hamlet* was first heard of, all England was agog hunting or unearthing burrowing assassins hired by the agents of claimants for her crown to kill the Queen by secret poison." The letter of Bacon's which the writer presently quotes and identifies in spirit with some lines in *Hamlet* does not afford the best instance of his skill in selecting extracts which may seem to favour his view. The unprejudiced eye will indeed detect no sort of resemblance between the prose and the poetry which are thus brought together. But perhaps the oddest of many odd things in this work is the attempt to prove, from the Ghost's description of the action of the poison dropped into his ears, that the play must have been the work of Bacon. The arguments here brought forward are amazing enough, and are evidently the result of an amount of trouble which one could wish had been employed in some business with which the writer was more fitted to deal. It is not perhaps particularly unfortunate that Mr. Thomson's style is unattractive and somewhat incoherent, and that he or his printers have made strange slips in the few Latin words which he employs.

The new edition of Mr. Heath's *Peasant Life* (6) is practically more a new book than a new edition. The work has been extended from one hundred to four hundred pages, and the original matter has been entirely re-written. As before, the writer has contented himself with recording his observations and "leaving political writers to draw from the facts what conclusions they please," and most of the facts give food enough for reflection.

Mr. Langford's selections from English authors "in praise of books" (7) have been made with judgment and discretion, and the little book furnishes better reading than do most collections of extracts. It is got up with becoming simplicity, and has only the too common fault of refusing to lie open.

A new edition appears of Dyce's Shakspeare (8). No alterations have been made in the text since the third edition, but the notes are now conveniently printed at the foot of the page instead of at the end of each play.

A second edition has appeared of Mr. Hellyer's exhaustive volume (9) on internal plumbing work, which exposes ruthlessly the many dangers incident to the old-fashioned systems, and points out the proper way of avoiding them. If the author is at times too sweeping in his condemnations, that is a fault on the right side.

In writing his *Treatise on the Law concerning Libel and Slander* (10), Mr. Flood appears to have acted on the opinion, in our judgment a gravely erroneous one, that a legal text-book may be made popular by a diffuse and flippant style. Law is a technical and scientific subject, and by no literary device can it be made otherwise. Clearness in arrangement and exactness in expression, not attempts at smart writing, are the proper ornaments of a legal treatise. We greatly fear that in his endeavour "to render the book easily readable, and to present the subject dealt with—considering its gravity and importance—in a form as interesting, and as destitute of technicality as possible," Mr. Flood will find that he has fallen between two stools.

A capitally annotated edition of the latest Wild Birds Protection Act is issued from the *Field* Office (11). The remarks in the preface are terse and to the point.

The *Field* Office also issues an annotated edition of the *Ground Game Act* (12), which will of course be a great convenience to magistrates, and to all persons affected by the Act.

The experiences of such a past master in Romany as Mr. Groome are necessarily interesting to those who would learn more of the gipsies of England. His recent work, entitled *In Gipsy Tents* (13), is, however, neither a nice work nor a clever one. It is introduced by a sort of preface written in the most execrable taste, on the first page of which the "lines are spaced out widely, as there is much to be read between them." This most of his readers are fortunately unable to do. We have then a circumstantial account of the life and habits of a very unsavoury and disreputable set of people, after the manner of George Borrow, but without the earnestness and rough humour of that writer; we are also favoured with sketches of Sylvester Boswell, a Romany gentleman of great erudition, according to his own account, and of a certain Welsh musician, whose only claim to notoriety is the fact that he combines in his own person the rather opposite characters of a gipsy and a respectable man. There is a good deal of philological information scattered throughout, indicating an amount of education which might have been turned to better use. Though written by a professed apologist for the race, the book will, we fancy, prove a wholesome corrective to a great deal of sentimental nonsense which has lately been written about a much overrated set of vagabonds.

Mrs. Arnold has collected together under various headings, with great industry, a quantity of passages from Shakspeare (14), which she hopes may "be found useful to students, by showing them at a glance the mode of thought of Shakspeare upon every subject handled by him," while it will also "be interesting to the general reader, and form a collection of excellent quotations." We must confess that this is a kind of compilation which seems to us to be anything rather than useful or desirable; but we are quite ready to believe that "it differs from all other books of the kind in being much more comprehensive."

The collection in one volume of the late Charles Turner's beautiful sonnets (15) has prefixed to it some memorial lines by the Laureate and a reproduction of Mr. Spedding's admirable essay, which is full of fine criticism and perception. Some forty or more of the sonnets are now published for the first time, and from these we select for quotation the characteristic one called "The Mute Lovers on the Railway Journey":—

> They bade farewell; but neither spoke of love.
> The railway bore him off with rapid pace,
> He gazed awhile on Edith's garden grove,
> Till alien woodlands overlapp'd the place—

(4) *Sword and Surplice; or, Thirty Years' Reminiscences of the Army and the Church.* By H. J. Wale, M.A., Magdalen College, Cambridge; late Lieutenant 15th King's Hussars and Scots Greys; late Rector of Folksworth, Hunts; Curate in Charge Worcester Park Church.

(5) *On Renascence Drama; or, History Made Visible.* By William Thomson, F.R.C.S., F.L.S. Melbourne: Sands & McDougall.

(6) *Peasant Life in the West of England.* By Francis George Heath, Author of "The English Peasantry," &c. New Edition. London: Sampson Low & Co.

(7) *The Praise of Books; as Said and Sung by English Authors.* Selected, with a Preliminary Essay on Books, by John Alfred Langford, LL.D. London, Paris, and New York: Cassell, Petter, & Galpin.

(8) *The Works of William Shakspeare.* The Text revised by the Rev. Alexander Dyce. 10 vols. Vol. I. London: Bickers & Son.

(9) *The Plumber and Sanitary Houses.* By S. Stevens Hellyer. Second Edition. London: Batsford.

(10) *A Treatise on the Law concerning Libel and Slander.* By John C. H. Flood, of the Middle Temple, Esq., Barrister-at-Law, &c. London: Maxwell & Son.

(11) *The Wild Birds Protection Act*, 1880; *with Explanatory Notes.* By Horace Cox. London: The "Field" Office.

(12) *The Ground Game Act*, 1880; *with Explanatory Notes.* London: Horace Cox, "Field" Office.

(13) *In Gipsy Tents.* By F. H. Groome. Edinburgh: Nimmo.

(14) *An Index to Shakspearian Thought: a Collection of Passages from the Plays and Poems of Shakspeare.* Classified under appropriate headings, and alphabetically arranged, by Cecil Arnold. London: Bickers & Son.

(15) *Collected Sonnets, Old and New.* By Charles Tennyson Turner. London: C. Kegan Paul & Co.

Alas! he cried, how mutely did we part!
I fear'd to test the truth I seem'd to see.
Oh! that the love dream in her timid heart
Had sigh'd itself awake, and called for me!
I could have answer'd with a ready mouth,
And told a sweeter dream; but each forebore.
He saw the hedgerows fleeting to the north
On either side, whilst he looked sadly forth:
Then set himself to face the vacant south,
While fields and woods ran back to Edith More.

A seventh edition appears of Canon Hole's *Book about Roses* (16), in the course of which thirty new roses are introduced to the reader.

Messrs. Ward and Lock issue a new and complete edition at a reduced price of Cruden's Bible Concordance (17), to which is prefixed a memoir of the author.

Mr. Denison's *Orcadian Sketch-Book* (18) is, as he says, peculiar in language and aim. His main object has been to preserve the dialect of his native place from "that oblivion to which all unwritten dialects are doomed," and in carrying this out it has come in his way to preserve a good deal of curious and amusing oral lore. The introduction contains an interesting sketch of the fortunes of Orkney, and a full glossary at the end of the book will enable any one, who cares to take the trouble, to read that part of it which is written in the Orkney dialect, a dialect which, without such aid, is puzzling enough.

Mr. Davison has shown a catholic taste in his selection of the authors from whom he has collected "a thousand thoughts" (19). With a view to avoiding matter which is common to other selections of the same kind, he has omitted Shakspeare and all living authors. It is very possible that his compilation may give pleasure to people who care for such collections of snippets.

A second edition has appeared of Mr. Burdett's *Cottage Hospitals* (20), which was reviewed some three years ago in these columns. It is enlarged and written up to date, and alphabetical tables at the end give full information as to the origin, management, and progress of every cottage hospital in the country. We trust the work may fulfil the author's hope that "it may tend to improve the management, to increase the popularity, and to extend the usefulness of cottage hospitals in all parts of the world."

(16) *A Book about Roses.* By S. Reynolds Hole. Seventh Edition. Edinburgh and London: Blackwood.

(17) *A Complete Concordance to the Holy Scriptures of the Old and New Testament.* By Alexander Cruden. To which is added a Sketch of the Life and Character of the Author. With Sixty Pages of Engravings. London: Ward, Lock, & Co.

(18) *The Orcadian Sketch-Book; being Traits of Old Orkney Life, written partly in the Orkney Dialect.* By Walter Traill Denison. Kirkwall: Pearce & Son.

(19) *A Thousand Thoughts from Various Authors.* Selected and arranged by Arthur B. Davison. London: Longmans & Co.

(20) *Cottage Hospitals.* By Henry C. Burdett. Second Edition, re-written and much enlarged. London: J. & A. Churchill.

THE CABINET AND IRELAND.

IT is understood that the Cabinet has for several days been anxiously considering the very serious question raised by the reign of lawlessness in a large part of Ireland. Opinions are said to be divided, and it is not likely that rumours of so circumstantial a kind are wholly wrong. But it is not known what are the precise points of difference, or what will be the ultimate decision of the Cabinet, if it contrives to exist without partial disruption. Meanwhile two Cabinet Ministers have stated their private opinions on the subject. Mr. CHAMBERLAIN and Mr. BRIGHT have spoken at great length and with complete freedom at Birmingham, and have informed their constituents that, although coercion is possible and necessary in conceivable circumstances, the occasion for coercion has not yet arisen. The Irish have grievances, Mr. CHAMBERLAIN contends; and as, according to constitutional theory, redress of grievances comes before Supply, so, by some odd analogy, redress of grievances ought to come before locking people up in prison. Mr. BRIGHT contented himself with remarking that force was no remedy, and that the bad things said to be going on in Ireland were, he felt sure, much exaggerated. Mr. CHAMBERLAIN, however, seems to have convinced himself that, after every possible deduction for exaggeration is made, enough remains to show that a considerable portion of Ireland is in a most terrible state. The plain fact is, that the question which the Government has to decide is not whether the disturbed districts shall go on under ordinary law, but whether they shall go on under no law at all. Law has no meaning unless it stops or punishes assassination, menaces of death, tyrannical dictation, violent assaults, destruction of property, the interruption of the peaceable intercourse of peaceable men. Of law in this sense there is no trace in the disturbed districts. It has been hoped that the reign of ordinary law might be restored by one or both of two means, but these hopes have been crushed altogether. The leaders of the Land League have been prosecuted, and it was considered possible that such terror might have been struck into their minds and the minds of their subordinates that the League would dwindle away for want of guidance. Nothing of the kind has happened, and a Roman Catholic ARCHBISHOP has forwarded a contribution to the PARNELL Defence Fund, on the express ground that, as the prosecution has had no political effect whatever, it must be regarded as merely starting a curious legal point, and he should like to have the side of the defence properly argued. It was also imagined that the Irish might be so touched with gratitude to the Liberal Government for its good intentions towards them that they would help their friends by behaving well. Mr. CHAMBERLAIN was very earnest on this head. May we not entreat, he said, and even demand, that the Irish shall do something for us who are ready to do so much for them? Mr. CHAMBERLAIN is quite entitled to entreat and demand as much as he likes, but it is quite certain that the Liberal party has been urging this plea for months, and that the Irish wrongdoers have not paid the slightest attention to it. Ordinary law has failed, a mild prosecution has failed, the gratitude that expects favours to come has failed. What Mr. CHAMBERLAIN and Mr. BRIGHT really mean is that, in their opinion, a large portion of Ireland shall go on without any law at all until the Government has had time to frame, to propose, and to ensure the success of, a new Land Bill.

There are some objections to coercion on which Mr. CHAMBERLAIN and Mr. BRIGHT did not touch, or touched very lightly, but which deserve notice. Force, Mr. BRIGHT said, is no remedy. This is only very partially true. Force does not redress grievances, and it does not cure disaffection. But it does remedy the particular evil which it is intended to remedy. It prevents the commission of crime; it puts an end to the open tyranny of lawlessness; it encourages those who are willing to abide by the law. And it also acts in another way. It counteracts the contagion of lawlessness. It prevents anarchy and impunity going hand in hand and bringing over the indifferent mass to what seems the winning side. It is with great reluctance that wise men have recourse to coercion, and it is most necessary to see that force is only used to such an extent and in such a way that the objects sought to be attained are attained, and that no more is attained. A White Terror is as bad as a Red Terror; but this is only to say that force may be abused, not that force within rigid limits cannot remedy such an evil as that which now exists in the disturbed districts—the evil of ordinary law being powerless. Then it is said that it would be a very tedious and difficult business to get a Coercion Bill through Parliament. Mr. CHAMBERLAIN and Mr. BRIGHT very properly took no notice of this objection. It is not for Cabinet Ministers to say that Parliament will not do its duty, will not listen to the Government, will not put down wanton obstruction. The difficulties of Parliamentary procedure may embarrass any Government on any subject; but a Government that thinks a thing ought to be done cannot avoid asking Parliament to do it on the mere speculation that Parliament will give it some trouble; otherwise it announces that it despairs altogether of the Parliamentary system. Lastly, it is urged that in this particular instance coercion cannot possibly effect the proposed object. Mr. DILLON, for example, has busied himself with anticipating and providing against coercion, and declares that, if a hundred leading members of the Land League were arrested, there would be another hundred to take their places and keep up the existing tyranny in all its rigour. For once in a way history does really teach by examples. We do not, strictly speaking, know what would be the effect of coercion in the districts now disturbed, but we do know what were its effect in instances precisely similar. In 1871 Lord HARTINGTON brought in his Bill to put down Ribandism in Westmeath, Meath, and King's County. His Bill passed, and Ribandism was put down by its leaders being frightened away. The description which Lord HARTINGTON then gave of Ribandism was this:—"Such a state of terrorism prevails that the Society "has only to issue its edict to secure obedience; nor has "it even to issue its edict; its laws are so well known, "and an infringement of them is followed so regularly "by murderous outrage, that few can treat them with "defiance. Riband law exerts such power that no "landlord dare exercise the commonest rights of pro-"perty; no farmer or other employer dare exercise "his own judgment or discretion as to whom he "shall employ; in fact, so far does the influence of "the Society extend, that a man scarcely dare enter "into open competition in the fairs or markets with

"any one known to belong to the Society." There is nothing new in the Land League. Every word applied by Lord HARTINGTON to Westmeath is now applicable to Mayo. The evil that existed then was not merely something like that which exists now. It was absolutely identical; and the remedy that proved effectual then may be expected to prove effectual now.

The Government is preparing a new Land Bill; and Mr. BRIGHT, like Mr. GLADSTONE, is confident that the Bill, when seen, will be at once recognized as satisfying the reasonable expectations of every one. If such a Bill can be framed, there is not the slightest reason to suppose it will not receive the patient, and even indulgent, consideration of both Houses of Parliament. If grievances, real serious grievances, suffered by Irishmen, are proved, Englishmen, in spite of their disgust and horror at the prevailing anarchy, will be ready to redress them. If a case of justice is made out, justice will be done. If a plea of equity is put forward, the ear of England will be open to the plea. If money is to be found, and it can be shown that, if spent, it will do lasting and great good, and that to find it is not to do injustice to the English taxpayer and to demoralize the Irish tax-spender, the money will be forthcoming. But it must be said that at present no one has been able to give even the faintest outlines of such a measure. Every now and then an amateur offers a scheme for an Irish Land Bill, but there are two facts which may be observed as to all these schemes. Every amateur glides over the difficulties of his proposal, and no amateur agrees with another. Still, if such a Bill can be devised by the Government, there will be every disposition to welcome it. But what Parliament will demand is that the measure shall be at once equitable and efficacious. It must do justice all round; it must offer a fair promise of redressing all the mischief with which it deals; and it must avoid creating new mischiefs as bad as or worse than those it remedies. Every day shows curious and unexpected difficulties, which the framers of such a Bill will have to overcome. One of the points for which Mr. BRIGHT most earnestly contends is that a large part of the disquiet in Ireland is due to the land being held by large proprietors. Mr. CHARLES RUSSELL has been studying and writing about the LANSDOWNE estates, and he thinks the rents have been unduly raised. But what induced the tenants to acquiesce in the raising of their rents? It was the threat held out by the agent that Lord LANSDOWNE would sell his estates, and the tenants would pay anything rather than get into the hands of small men. In another case Lord LOUTH let some land to a tenant at 10*l.* 10*s.* a year. The tenant sublet it for 26*l.*, and had the audacity to ask and obtain from Lord LOUTH a reduction of his rent in consequence of bad times, and then refused any reduction to his sub-tenant. A Land Bill that prevents the rich from grinding the poor will do little for Ireland; it must prevent the poor from grinding the poor, if it is to be efficacious, and to ensure this is a very difficult task. The Bill of the Government must, to succeed, be the fruit of long, patient, wide-reaching study. No Government that ever existed could frame a good Irish Land Bill, if such a Bill is possible, without long deliberation. The Disturbance Bill of last Session failed, not because, as Mr. BRIGHT thinks, the Lords always reject every Bill they ought to pass, but because it was obviously ill considered, and was the fruit of a sudden impulse. If anarchy is to continue in the disturbed districts until the Government bring in a Land Bill, then, if the time is short, the Land Bill will be necessarily a Bill to which proper attention has not been given. If the time is long enough to permit the Bill being adequately considered, it will be so long that this continuance of unpunished lawlessness will be a standing reproach to England and a curse to Ireland, far worse than the most bitter critics of the Irish can think they ought to be permitted to endure.

EASTERN AFFAIRS.

THE SULTAN, although he has failed to keep his promise to the LORD MAYOR, has since the date of his Guildhall message assured the English and German AMBASSADORS that Dulcigno will be surrendered without delay. It would be rash to rely too implicitly on the occurrence of an event which has been so long postponed; but, on the whole, the chances seem to be in favour of compliance with the undertaking repeatedly given by Turkey. DERVISH PASHA is supposed to be more resolute and more thoroughly in earnest than his predecessor; he has a large force of regular troops; and he seems to have persuaded some of the Albanian chiefs to abandon further resistance. The most convincing argument which he could employ would be an announcement that he is authorized to use force if the commands of the SULTAN are not peaceably obeyed. The garrison of Dulcigno has hitherto been expected to retire before the Montenegrins, who declined to advance, under coercion from the combined fleet which was neither to land troops nor to bombard the town, and at the instance of a Turkish general who considered that he was not authorized to fire on loyal subjects of the SULTAN. The fleet has for some time past suspended the so-called demonstration, and nothing has been heard of the Montenegrin army; but the SULTAN seems at last to be bent on the fulfilment of the treaty, in spite of the real or pretended obstacles which were placed in the way of his Government by provincial patriotism. It is not improbable that the Albanian League, which has often furnished the dilatory diplomatists of Turkey with an excuse, may of late have caused real embarrassment. The closeness and permanence of the bond which unites the different Albanian tribes is doubtful; but, as they acquire the habit of acting together, they may probably become jealous of attacks directed against any part of their territory. As the SULTAN is likely to need the aid of the Southern Albanians against the Greeks, he is probably cautious of offending the feelings of those who border on Montenegro. If the complicated difficulties of the case are at last surmounted, the boasted concert of Europe will not have been wholly ineffective. The SULTAN will probably console himself for his final submission to a just demand by the consciousness that he has proved his capacity to be still troublesome to Europe. He has in the course of the negotiations ascertained that he will for the present be secure against naval demonstrations as soon as he has surrendered Dulcigno.

In accordance with the latest exposition of his policy, Mr. GLADSTONE will not engage in any separate adventure for the benefit of oppressed nationalities. His undoubted good will to the Greeks will probably exhibit itself in the form of advice to abstain for the present from aggression. They have a legal right to some extension of territory, inasmuch as more than one Turkish Commission has been appointed to discuss the line of a new frontier. A still stronger moral claim is founded on national and religious sympathy with the population of the border provinces; and prudent politicians are reasonably anxious to strengthen the only State in South-Eastern Europe which is likely to pursue an independent policy. Mr. GLADSTONE repeated at the Guildhall the expression of his belief that the Greek claims would be conceded by Turkey, if they were heartily supported by the Great Powers; but the condition is not at present satisfied, and the Greeks are warned that they are not to expect a separate alliance with England. They have no other foundation for reasonable hopes of success. Russia has never been enthusiastic in their cause, and the other Continental Powers care much more for the maintenance of peace than for the substitution of Orthodox for Mahometan rule. Prince BISMARCK is reported to have said that he should be glad to see the Greeks beat the Turks as their ancestors defeated the Persians; but in the present day the barbarians are more disciplined and more recently inured to war than the Greeks; and their cause is better than that of XERXES, because they have for several centuries held possession of the disputed territory. There is reason to believe that the representatives of Germany, of Austria, and of France have, in similar or identical terms, cautioned the Ministry of Athens against the adoption of an aggressive policy. Good advice becomes exceptionally impressive when it proceeds from powerful Governments. Mr. GLADSTONE has probably been disappointed by the concurrence of France in the resolutions of Germany and Austria; but the Western Powers could not in any case have prudently engaged in a diplomatic conflict with two Empires which were deeply interested in maintaining the present state of Turkey.

It is reported that the Chamber at Athens has been engaged in animated debates, but the issues on which the Government and the Opposition are contending are but imperfectly understood. The party of Mr. TRICOUPIS and the supporters of the present Government profess equal

eagerness for war; and it may be remembered that the KING's call to arms in his speech at the opening of the Session preceded in time the change of Ministry. The armaments, which seem to furnish an additional argument for the conflict which they were designed to sustain, began several months ago, and they are still far from completion. It is probable that, although both parties may use equally warlike language, one of them really desires to postpone a dangerous and doubtful struggle. Sound patriotism is sometimes tempted or compelled to disguise itself by acquiescence in popular prejudice. The resignation of the late Ministers may probably have been caused by their unwillingness to take the decisive step of declaring war; and, if so, their Parliamentary efforts will be directed to avoidance of an immediate rupture. Mr. COUMOUNDOUROS has once more assured an English newspaper Correspondent that the political and financial consequences of a retrograde policy would be more perilous than the hazards of delay. The Ministry also announces that a large loan has already been arranged; and, if the statement is true, the terms of the bargain will undoubtedly be onerous. Nevertheless, peace, however unpalatable, must be cheaper than war; and there seems to be no reason to fear any display of popular resentment, except perhaps a demand for another change of Ministry. Mr. COUMOUNDOUROS himself lately acknowledged that many of the recent recruits are as yet wholly uninstructed. It would be at the same time cruel and unwise to expose raw troops to an encounter with a formidable enemy; and defeat would produce a far deeper feeling of indignation than any temporizing policy. An acute community must well understand the reasons which may deter the Government from executing impracticable threats. A communication to the Chamber of the advice which has probably been tendered by friendly Courts could scarcely fail to have due weight with rational politicians.

The decision between peace and war may perhaps not rest absolutely with the Greek Ministry. The Turks, if they think war advisable, will be fully justified in anticipating a rupture which the enemy loudly proclaims as imminent. A belligerent is not bound to wait for the convenience of an adversary who makes no secret of his hostile purpose. Perhaps Mr. COUMOUNDOUROS may intentionally provoke an attack on the part of Turkey, in the hope of securing foreign sympathy and aid in defending his country from attack. It is also possible that the struggle may be begun, without authority from either Government, by irregular bands on the border of Thessaly and Epirus. Neither the Greek nor the Turkish Government would think itself bound to repress the zeal of undisciplined patriots, even if they were bent rather on plunder than on conquest. A local war once commenced would lead to the despatch of reinforcements, and eventually to the advance of both armies to the scene of action. It is not known whether the Turkish Government has made any considerable preparations for war, or even whether it will seriously defend those parts of its territory which it has from time to time offered to cede. A Greek force in Thessaly and in the south-east of Epirus would have the great advantage of acting in the midst of a friendly population. It is in the execution of the disputed portion of the Berlin award that insuperable difficulties will probably occur. In defending Janina, Prevesa, and Metzovo, the Turkish Government will be warmly supported by the Albanians, who are probably, even in the absence of regular troops, more than a match for a Greek invader. The local resistance of the tribes would not be hampered by the diversion which is probably anticipated to arise from insurrections in the neighbouring provinces.

M. DE FREYCINET AND THE FRENCH MINISTRY.

M. DE FREYCINET has made his explanation, and, after all, nothing has been explained. It is not given to every Minister to evince the delightful candour which characterizes Lord DERBY on leaving office; but the circumstances of this particular retirement were so exceptional that the most scrupulous reticence might be expected to give way when once M. DE FREYCINET was on his legs. M. DE FREYCINET proved himself to be possessed of a quite extraordinary faculty of defeating expectation. He first excited the curiosity of the Senate by announcing his intention to speak just when M. FERRY was making him the subject of a complimentary, but inaccurate, reference; and then, when his turn came, he delivered a speech which was quite to the purpose as a justification of the policy he had proposed to carry out, but not the least to the purpose as a justification of his own conduct in regard to that policy. M. DE FREYCINET gave the fullest and most conclusive reasons why he had refrained from dispersing the rest of the orders after he had dispersed the Jesuits. He showed why he had thought it prudent to hold his hand, and to what good advantage he had employed his time while holding it. He maintained that the distinction between the Jesuits, who were to be dispersed at a date fixed in the Decree, and the other orders, who were to be dispersed at a date to be chosen by the Government, represented a distinction in the tasks laid upon the Minister. His business was to disperse the Jesuits and to bring the other orders into subjection to the State. Dispersion was to be really applied to the Jesuits, while the remaining orders were only to be threatened with it. The only way of extorting any kind of submission from the orders was to open negotiations with the Vatican; and M. DE FREYCINET asks, with great pertinence, what is the use of having a Concordat, keeping an Ambassador at the Vatican, and receiving a Nuncio at Paris, if, when questions of common interest arise, the French Government is not to negotiate with the POPE. There is a party in France which desires the abolition of the Concordat, the suppression of the Budget of Public Worship, and the separation of Church and State. They, as M. DE FREYCINET says, are logical. But it is not logical to desire the maintenance of the Concordat, to argue against the separation of Church and State, and yet to treat the head of the Catholic Church as though he did not exist. This is a neat and well-deserved thrust at M. GAMBETTA. M. GAMBETTA has committed himself with more positiveness than he has often shown of late to the doctrine that the Church is too dangerous a power to be allowed her freedom. He desires the retention of the Concordat, because he holds that it gives the State an advantage which it would greatly miss if the Concordat were abolished. Yet the persons and journals usually supposed to express M. GAMBETTA's mind were markedly hostile to M. DE FREYCINET's negotiation with the POPE. In spite of the treaty, in spite of the Ambassador, in spite of the Nuncio, they thought it degrading to the French Government to have any dealings with the head of the Catholic Church. M. DE FREYCINET took care, however, to add that his colleagues in the Cabinet did not take this view. There was not one of them, he said, who had not wished him success in the steps he was taking. Nor did any difference arise in the course of the negotiations. The POPE was conciliatory from the first; the orders, under pressure from the Vatican, became conciliatory. The orders were to make a declaration which should give the Government an excuse for postponing further action until the meeting of the Chambers, and as soon as the Session began the Government undertook to bring in a Bill to regulate the right of association, under which the orders might apply for recognition. Upon all these points the Cabinet was, to all appearance, united, and M. DE FREYCINET hints that it would have remained united but for his speech at Montauban. After that, he says, difficulties arose. Now, as the part of this speech which referred to the religious orders was only a statement of the policy which had already been agreed to by the Cabinet, the natural inference is that the cause of these difficulties is to be sought elsewhere. M. DE FREYCINET's Cabinet was broken up from without, not from within. The dissentient Ministers did not discover that they disapproved of his policy until they had first discovered that it was disapproved of by a great personage outside. M. DE FREYCINET gave no hint of this beyond the solitary and significant reference to his Montauban speech. He was as unwilling as M. FERRY had before professed himself to gratify the lovers of anecdote, and he accordingly contented himself with the statement, as damaging to M. FERRY as anything that could well have been said, that the whole Cabinet had been acquainted with what was going on between the Government and the Vatican, and that it was only when the policy they had assented to was made public that they saw any reason for withdrawing their consent.

There is another question upon which M. DE FREYCINET must be able to say much that would be interesting,

he not upon this point also imposed on himself the rule of silence. If he had held any post but that which he did hold, his resignation would have been quite intelligible. He would simply have proposed a certain policy to the Cabinet, have secured its acceptance in the first instance, and then have failed to remove the later scruples of his colleagues. But this is not the process ordinarily followed when the proposer of a policy is the Prime Minister. In that case, if the consent which at first seemed to be that of the whole Cabinet, proves in the end to be only that of a part of the Cabinet, it is the dissentients who retire. They find themselves unable on reflection to adopt the Prime Minister's views, and they place their resignations in his hands. In the recent change of Ministry in France this process was entirely reversed. Instead of the dissentient Ministers placing their resignations in the hands of M. DE FREYCINET, M. DE FREYCINET may be said to have placed his resignation in the hands of the dissentient Ministers. There was never perhaps a Ministerial crisis in which the parts were so completely reversed. The malcontents in the Cabinet had the mastery from the first. This is the more remarkable because there is some reason to believe that M. GRÉVY was of the same way of thinking as M. DE FREYCINET, and if so he might, had he chosen, have retained M. DE FREYCINET in office, and filled up the places of M. FERRY and M. CONSTANS. It seems likely, however, that he must have given M. DE FREYCINET a hint to retire, because the PRIME MINISTER would hardly deprive the PRESIDENT of his services on no better ground than the necessity he was under of parting company with some of his colleagues. He must surely have given the PRESIDENT his choice in the matter, and have left it to him to say whether he would begin the reconstruction of the Cabinet at the top or at the bottom. If so, it must be supposed that M. GRÉVY used the opportunity of choice thus afforded, and determined that M. DE FREYCINET should go and that M. FERRY should remain. It is pretty clear, therefore, that the President of the REPUBLIC is no more his own master under the present order of things than the PRIME MINISTER. Each has to bear his burden and to receive his orders. Whether M. DE FREYCINET was willing to remain Minister in spite of M. GAMBETTA had M. GRÉVY wished it, or M. GRÉVY was willing to retain M. DE FREYCINET in spite of M. GAMBETTA had M. DE FREYCINET wished it, are points which the debate in the Senate has made no clearer than they were before.

The French Conservatives have lately heard some very plain truths from an unexpected quarter. They have certainly not been seen to much advantage during the recent conflicts between the police and the religious orders. A genuine street riot, caused by the inability of the authorities to restrain an expression of popular sympathy with the dispossessed monks, might have served the turn of the Opposition very well; but nothing was to be gained by undignified struggles with officers who were only obeying orders. An article in the *Figaro* professes to give the reason why this kind of demonstration has been so much in favour with the Right. They only care, it seems, for politics when some amusement is to be got out of them. They will go in crowds to see a scene in the Chamber, or to dinner at Chambord, or to a barricade set up in a monastery. It is the dull work of politics that they dislike—the quiet endeavours to undo the injustice wrought by the Government, which, if persevered in, would in the end do more than anything to impress the French people. The way in which M. SAINT-GENEST would have had them meet the Decrees would have been by at once providing asylums for the dispossessed monks, employment for the functionaries who had given up their places rather than be instrumental in dispossessing them, and schools for the children whom the monks are no longer there to teach. But, as in so many other instances, the men who are constantly proclaiming their resolution to endure this or that extremity, cannot endure to put their hands in their pockets. That is an operation out of which no amusement is to be got. They prefer to talk about "children without a GOD and monks without a home," and to leave both to shift for themselves. This is not the way to convince the French nation that the religious part of it is really in earnest, and unless this conviction can be created, M. SAINT-GENEST is of opinion that the religious and Conservative part of the nation is in a fair way to be eaten up by the Radicals. M. SAINT-GENEST regrets the approaching catastrophe, but he is not surprised at it, nor does he affect to think that it is undeserved. The Conservatives have become a party of mere talk, and in so severely Radical a world as France is now, a party of mere talk has no chance of living.

THE IRISH ANARCHISTS.

ALTHOUGH it is difficult to determine when fallacies are too gross for refutation, it may perhaps be desirable to expose the perverse pretence that the present Irish agitation is in any sense constitutional or legitimate. Mr. PARNELL, indeed, has on more than one occasion asserted that the organization of the Land League furnishes a substitute for agrarian murder. It would not, as he declared, have been necessary to assassinate Mr. BOYD if a branch of the League had been previously established in the district. The demagogues have sometimes compared their conspiracy with the operations of Trade-Unions, or with the proceedings of the Corn Law League of five-and-thirty years ago; but it may be doubted whether they really wish to convince their followers that they confine themselves within the limits of the law. The leaders are not careful to rebuke their accomplices who publicly threaten the landlords with "leaden pills," or announce that five hundred thousand men in America would die happy if each could first have shot a Saxon. The apologists of the League in England, addressing a different audience, seek to extend to the Land League the toleration which has been enjoyed by many more or less factious clubs and associations. A knot of fussy and obscure admirers of anarchy have instituted a little society of their own for the professed purpose of securing impunity to the promoters of the Land League. In their profession of principles they announce that organized agitation is the best security against crimes of violence. The most conspicuous member of the new Club is a lady who has often exhibited the distinctive peculiarities of the limited class to which she thinks fit to belong. The combination of feminine logic with masculine obtuseness of perception seems to constitute the political variety of the strong-minded woman. There is reason to fear that the promoters of the movement may be disappointed of the interview for which they have applied to Mr. GLADSTONE. If, through an excess of courtesy, he should grant their request, he will perhaps explain to them the meaning of constitutional agitation.

During the earlier stage of his agitation for Repeal O'CONNELL embarrassed the Government of the day by incessant repetition of the argument that petitions for the repeal of an Act of Parliament were presented in exercise of an acknowledged constitutional right. He further contended that combinations for a lawful purpose were necessarily legitimate; and, although his meetings and his speeches brought Ireland to the verge of rebellion, he provided plausible excuses for English politicians who found it convenient to excuse or vindicate his conduct. The managers of the Land League, instead of following the precedent established by O'CONNELL, pass by Parliament in their direct and avowed prosecution of their lawless purposes. They avow their intention of abolishing "landlordism," or the ownership of land demised to occupying tenants, and they urge their followers at once to withhold payment of rent, or of the excess of rent beyond a standard arbitrarily fixed. The rack-rent which they denounce is an undisputed debt; and instigation to refuse the discharge of legal obligations would be a crime even if compliance with the counsels of the agitators were intended to be exclusively voluntary. A still more fundamental doctrine of the Land League is that no member of the body, and, it may be added, no other person, shall occupy land vacated by eviction on account of non-payment of rent. The laws enacted by the multitude on the proposal of Mr. PARNELL and his associates are to be professedly enforced by the formidable machinery of social excommunication, with the well-understood supplement, in case of disobedience, of mutilation of cattle, of bodily torture, of arson, and of murder. Combination for such objects by such methods will only cease to be unlawful when all known or imaginable laws are repealed. Instead of applying to Parliament for the relief of alleged grievances, Mr. PARNELL tells the multitude that it must legislate for itself, in the assurance that Parliament must hereafter recognize and sanction a spoliation which has once

been effected. O'CONNELL's case would be analogous if, instead of expressing a belief that the Act of Union would be repealed, he had openly advised a refusal of obedience to the existing authorities, and assured his followers that Parliament would recognize a successful revolt.

The atrocious conspiracy which has been organized against an agent in Mayo merely because he has discharged his duty to his employer has so far pleased the fancy of his savage persecutors as both to furnish a precedent of oppression, and to add a new word to the jargon of anarchy. At a late meeting of one of the branches it was resolved to "BOYCOTT" fourteen persons who are thought to have offended against the legislation of the League. Some are probably landlords or agents, or tenants who have taken prohibited land. The remainder may be tradesmen, or workmen, or private enemies of some of the local agitators. All these victims of intolerable cruelty are to be excluded from all the intercourse of life like heretics in the worst part of the dark ages. On pain of sharing their sufferings, or of still worse evils, no servant or labourer is to work for them; no tradesman is to sell them the necessaries of life; no dealer is to buy their produce; and if, without an explicit sentence, any of them should meet with a violent death, they may be well assured that no witness of the crime will be forthcoming. Since the time of the French Convention and of the Jacobin Club no more abominable organization of lawless tyranny has been witnessed. Provision has been made for even the rare and improbable contingency of the apprehension of assassins. Mr. BIGGAR lately announced that the League would bear the cost of defending such prisoners, because, as he said amid the sympathetic laughter of the audience, he might perhaps be innocent. The League would never trouble itself about his peril if he were known to be innocent. Mr. PARNELL loudly complained of certain precautions which the police had taken to prevent tampering with witnesses in the case of Mr. BOYD. Any interference with the ruffians who execute the informal decrees of the League is intolerable to the virtual principals.

The prosecution of the leaders, though it may too probably be abortive, is, as might be expected, a subject of indignation and menace. Mr. DILLON, the former apologist of cattle-maiming, and one of the defendants, has the audacity to recommend that the landlords shall be held responsible for the immunity of the chief conspirators from punishment. One peculiarity of the constitutional agitation is a claim to be above the law. The accomplices outside are to take hostages from the Government, and the landlords are within easy reach. It is true that, after threatening the landlords in general terms, Mr. DILLON speaks of an attack, not on their persons, but on their pockets. If his advice is literally followed, rent is to be wholly withheld till Mr. DILLON and his confederates are acquitted. A more liberal interpretation of the proposal will suggest itself to the popular mind. The landlords who are to be robbed or murdered in retaliation for the proceedings of the Government have no control over its policy. If they had been consulted the majority of them would probably have recommended an entirely different course of action, though it may be admitted that precautionary measures and summary justice would be less acceptable to the offenders than a doubtful appeal to a jury. Mr. DILLON's speech illustrates the invariable tendency of lawlessness to become more and more violent and unscrupulous. If there is any truth in O'CONNELL's maxim that he who commits a crime gives strength to the enemy, the enemies of the Land League, or, in other words, the respectable portion of the community, ought to have accumulated a large reserve of strength which has not yet been expended on its behalf by the Government. There is some reason to believe that, in spite of malignant pedants and strong-minded women, opinion in England is rapidly becoming unanimous. The long hesitation of the Government has probably had the effect of straining the patience of those who still retain any regard for law or for liberty. Even the Birmingham Association expresses disapproval of the conduct of the Land League, though it of course thinks it necessary at the same time to protest against the law and the tenure of land. It is less surprising that Lord CORK should have expressed at Bristol the probably well-founded opinion that the Land League agitation has but little to do with any wrongs which may have been formerly inflicted on Ireland. The contrary proposition is maintained by a writer of a pamphlet who has succeeded in eliciting one of Mr. GLADSTONE's effusive expressions of gratitude. Of one slight oversight Mr. GLADSTONE mildly complains. An account in the pamphlet of the Land Act casually omitted all mention of the compensation for disturbance which was not unreasonably considered by Mr. GLADSTONE and his colleagues the most important provision of the Act. Germs of future legislation which were invisible in 1870 are about to expand freely, if their vegetation is not checked by the contemptuous rejection of the whole system by the Land League. In the most innocent part of his last speech Mr. DILLON declared that the Land Act is not to be extended, but to be abolished altogether.

THE LAHORE DURBAR.

THE political characteristics of Englishmen have no doubt undergone some change of late years, yet there are some which continue to show themselves with unvarying constancy. Among these perhaps almost the first place is due to a certain impatience of important questions after they have reached a given stage. "Let us "hear no more of it" is the familiar phrase which expresses this feeling, and as an illustration of the feeling itself nothing could well be more striking than the little attention which has been paid to Lord RIPON's reported utterances at the recent Durbar at Lahore. A very few months ago Afghanistan was sufficiently frequent in the mouths of men. It certainly cannot be said that the brilliant success achieved by General ROBERTS—whose arrival in England almost at the same moment that the news of Lord RIPON's speech came to us might have been thought likely to recall public attention to the subject—ended the Afghan question. On the contrary, that question is in a more difficult, if not a more actively troublesome, condition than ever. The singular combination of resolution and irresolution which made Mr. GLADSTONE's Government decide to hold Candahar during the winter without following up the advantage of the 1st of September, and without finally determining the future status of the city itself, has produced its natural fruit. AYOUB has plucked up his spirit and is recruiting his forces in Herat; ABDURRAHMAN is holding his own, and not more than holding his own, at Cabul; the tribes of the centre are once more thinking of openly avowing their allegiance to YAKOOB, the only chief whom they have really favoured. At any moment the country may be in a blaze again, and though there is no longer much danger of a repetition of the disasters of the summer, the announced retreat from the Kurum deprives us of the last chance of effectively and speedily quenching a conflagration. The policy of holding or of evacuating Afghanistan must always be a question rather for experts possessed of local knowledge than for critics at a distance. But critics at a distance are entitled to say that a policy of shilly-shally between the two can have only one result.

It is this moment that Lord RIPON has chosen for the announcement that he intends to return to the policy of Lord LAWRENCE, and that in the future internal development is to occupy the attention mainly, if not exclusively, of the Government of India. A reporter with a nice sense of distinctions has called this "virtually a manifesto"; we shall take the liberty of discarding whatever limitation may be intended by the use of the adverb. It is a manifesto, and one of the gravest import. Pointed reference was made, it seems, to a Durbar held by the late Lord LAWRENCE in 1864; and it appears to have been implied, or stated, that the last sixteen years were to be regarded as a regrettable "loop" in Indian policy. In making use of such allusions Lord RIPON must have known very well what would be inferred from his words. It does not very much matter what the policy of the late Lord LAWRENCE actually was. It matters very much what construction has been placed on that policy in recent political controversy. That construction is sufficiently well known. For a Liberal Viceroy of India to announce his return to the policy of Lord LAWRENCE means that the policy which Mr. GLADSTONE's last Government instructed Lord NORTHBROOK to carry out is to be enforced to the utmost. What happens outside the frontiers is to be a matter of no moment, or of a languid diplomatic interest only, to the Governments at home and in the peninsula. India is, if possible, to be developed—that is to say, the lamb is to be carefully fattened; but the eyes of the shepherd are to be as carefully averted from any con-

sideration of the neighbourhood of the wolf, and the state of the walls of the fold. Just before he made these remarkable utterances Lord RIPON had been reviewing an imperfectly victorious, but still a victorious, army, to which he had paid merited compliments. But his statements at the Durbar, if not exactly a slight upon that army, amount to an insinuation that it is a somewhat superfluous instrument. All that Indian statesmen have got to do is to attend to home affairs and to let foreign affairs alone. A few months, if General SKOBELEFF's calculations are not wrong, may place him within a stone's throw, metaphorically speaking, of Northern Afghanistan; and Northern Afghanistan is divided between a declared foe of England who has been allowed to escape almost scot-free after affixing a terrible disgrace upon us, and a very uncertain friend, whose good will and power are equally doubtful. Barely three months have passed since the ease with which a hostile army, heavily equipped with artillery, can pass from the frontiers of Turkestan to the immediate neighbourhood of the frontiers of India was proved to demonstration. But all these things have apparently had no effect on Lord RIPON, or on those whose mind he speaks. True, the presence of ten thousand British troops (at least, ten thousand on paper) at Candahar seems to show that internal development is somehow or other not the only thing which must occupy an Indian Government. But this is ignored. The policy of the ostrich, and something more than the policy of the ostrich, is again openly avowed. The angry political inflammation which at the present moment extends over half Asia attracts none of Lord RIPON's attention. He speaks, apparently, as if profound peace reigned in Persia, in the desert, in Afghanistan, on the frontiers of China. He has nothing to do but to cultivate his garden; and spades and navvy's gear, not swords and intrenching tools, are to be the instruments of cultivation.

And yet, as we have said, there landed in England within a few hours of this speech of Lord RIPON's a man who was fresh from the task of relieving and partly avenging a beaten Anglo-Indian army. Sir FREDERICK ROBERTS amply deserved his reception at Dover, and a good deal more too. His famous march was the subject of some absurd apprehensions before it was completed, and of some disproportionate laudation afterwards; his victory, not in the least by his own fault, was curtailed and shorn of its proper consequences and completeness. But few modern generals, perhaps no other modern general for many years, have so thoroughly performed the task set them to do, and nothing higher can possibly be said of any soldier than this. It would, however, be exceedingly interesting, if military and political etiquette permitted it, to hear Sir FREDERICK ROBERTS's opinion as to this formal announcement by Lord RIPON that the sword may now be turned into the ploughshare all over British India. General ROBERTS has himself been almost uniformly victorious. Yet he has seen, as we have said, other English generals cooped up by hostile forces; and he has himself, at no very distant time, been subjected, though under less painful circumstances and with a more satisfactory result, to the same humiliation. He knows that the power which did this still exists, that it is only divided and temporarily reduced, not finally crushed. He is not at all likely to be prejudiced in favour of a forward policy by any vulgar feelings of self-interest; for the credit which he has won ought, at least for the time, to be sufficient for a very glutton of fame and fighting. He is said to be in favour of the permanent retention of Candahar, as indeed are most military men; but that is not the point at issue. The point is whether any one acquainted with the circumstances and unbiassed by political necessities and prejudices can adopt, as Lord RIPON would seem to have adopted, the policy of blindness to the external dangers of India. No doubt there are internal dangers, too, though it is at least worthy of consideration whether over- rather than under-development may not be said to be at the bottom of most of these; but that is not the point either. Of course it is of the highest importance that the prevention and mitigation of famine, the development of manufactures, the proper distribution of taxation, and all the other cares of a wise Home Office, should occupy the attention of the Indian Government. But the question is whether the attitude which might have befitted England as to her own interior condition at the conclusion of the NAPOLEON wars befits India now. It is inconceivable that a practical soldier or a statesman unpledged to party should answer the question in the affirmative. The mere utterance of the words Persia, Merv, Herat, Cabul, Kashgar, Burmah, is sufficient to show that such an answer is utterly wrong. No doubt it is advisable that the military cares and proceedings of the Indian Government should be directed rather to defence than to offence. But defence in Eastern countries has to be of a decidedly offensive character. The mere expression of a plaintive desire to be left alone and allowed to develop oneself comfortably and at leisure is certainly not the way to secure the opportunity for such development. Distasteful as the fact may be to certain schools of politicians, we won India by the sword, and by the sword, like every one else who has ever had anything to do with the country, we must keep or lose it. The expenditure necessary for the purpose of keeping it is no doubt to be regretted; but it is the most necessary and remunerative expenditure in the whole Indian Budget, and there is no reason to believe that, if minimized by a constant maintenance of the army in a state of efficiency and by the showing of a bold front, so as to discourage attempts from without, it is more than the country can fairly bear. On the other hand, the policy, at least as that policy is construed by his own party, to which Lord RIPON announces his return, means in all human probability another Afghan war and the expenditure of an unknown number of millions, perhaps at a time when England and India may be in the severest straits.

THE FRENCH DEBATE ON THE MAGISTRACY.

MOST English readers of newspapers are aware that a measure has been introduced into the French Chamber for a reform of the magistracy, and that the principal provision of the measure is that during the period of one year magistrates belonging to Courts inferior to that of the Supreme Court of Appeal shall be removable at the discretion of the Executive. What cannot be learnt from the ordinary sources of information is how this proposal comes to be made, how it is defended, and on what grounds it is attacked. Every proposal of the Government is attacked by its avowed enemies, but this proposal is attacked by some who are the Government's warm friends. The debate has been ably conducted, and the speeches of those Republicans who support and those Republicans who attack the proposal throw much light on the past history of France, on the present state of French feeling, and on the incidents of French daily life. It is impossible to notice all the speeches that have been made during a long debate; but the speeches of M. RIBOT against the proposal, of M. WALDECK-ROUSSEAU in support of it, and of M. BOYSSET, who not only contributed general arguments in its favour, but adduced specific facts to show that it was needed, may be taken as representative. M. RIBOT is a Republican of the DUFAURE school, and he naturally opposed a measure which he thought revolutionary in itself and dangerous to the Republic. But his line of argument was one which no one but a Frenchman could have invented. He maintained, in the first place, that the magistrates were covered by a sort of prescription. The Republic has now lasted for ten years, and even if a new Government has a title to purify the magistrature, the Republic is barred by time from exercising the right. Magistrates have, he admitted, given recently very perverted decisions in political cases, but that, he suggested, was the fault not of the magistrates so much as of the Legislature, which ought long before this to have referred all political questions to a jury. Magistrates have also given numerous decisions against the agents of the Government in questions arising out of the expulsion of the congregations. But the contention that the Government was wrong in point of law was supported by the authority of a large body of eminent jurisconsults, and magistrates must not be accused of perverting justice to spite the Government simply because they shared the opinion of acknowledged leaders of the Bar. The Tribunal of Conflicts has now decided the law, and decided it by a majority which was only a majority because a member of the Government exercised his right to sit as a member of the Tribunal. However the decision may have been obtained, it exists, and M. RIBOT declares that he would be ready to visit with the most terrible penalties any magistrate who did not obey a

decision which he is bound to obey. But here comes in a phase of French law which is altogether out of the sphere of English thought and experience. The decision of a Court of Appeal, however supreme, is only a "doctrine" which inferior tribunals may adopt or not. In the particular cases carried to the Court of Appeal the judgment is final; but in new cases precisely similar the magistrates may decide, if they please, in direct contravention of the Court of Appeal, and leave suitors to get redress by carrying their cases to the higher tribunal. That in practice the French judges have been irremovable, M. RIBOT avowed that it was impossible to contend. NAPOLEON I. openly declared that his judges must do what he wished, or lose their posts. The charter accepted at the time of the Restoration expressly laid down that judges should be irremovable; but the Government of the Restoration soon cleared the Bench of its opponents, under the pretext that the charter said that judges were appointed by the King, and that, therefore, all judges named before there was a King to appoint them might be dismissed. Under the Second Empire the judges were nominally irremovable, but obnoxious judges were got rid of by the simple process of carting them beyond the French frontier, and filling up their places on the ground that they were absent without leave. But all these Governments were, in M. RIBOT's eyes, bad Governments. What he maintained was, that good Governments did not remove judges. After the Revolution of 1830 the same proposal was made which is made now, that during a year judges should be removable; but this proposal was rejected, through the influence of the Government. In 1848 the Assembly refused to sanction the dismissal of judges who had been summarily relieved of their duties by the Keeper of the Seals, and among the supporters of this refusal was found M. BARTHÉLEMY ST.-HILAIRE. But the argument on which M. RIBOT most confidently insisted, and which seems to have most approved itself to his auditors, was that no Keeper of the Seals could, in the short time of a year, look personally into all the cases of magistrates said to be hostile which would be nominally brought before him. A door would be open to all kinds of enmities and calumnies, and while one obscure clerk in the provinces would settle that a magistrate should be hunted down, another obscure clerk at Paris would settle that the end of the hunt should be the destruction of the victim.

M. WALDECK-ROUSSEAU is the reporter of the Commission in concert with which the Government has brought in its Bill, and it was he who replied to the attack of M. RIBOT. He set himself, in the first place, to destroy the assumption that the judges held their offices under any pledge that they would not under any circumstances be removed. What they really held was a title to permanence of office, subject to the right of every new Government to remove them on its entrance into power. No one could contend that under the First and Second Empires, and under the Restoration, this had been the nature of the tenure of judicial office. Under LOUIS PHILIPPE, the judges had not been removed, but the Government long hesitated whether it would or would not exercise its right, and only decided to abandon it when it thought it had discovered a milder equivalent. It forced all the judges to swear allegiance to LOUIS PHILIPPE, and, as sincere Legitimists would not perjure themselves, the Bench was purified, in an Orleanist sense, by the resignation of all who were hostile. In 1848, it is true, the leading Republicans decided against using the right of removal; but many other leading Republicans thought this decision wrong, and no one was so distinct in condemning the foolish piece of self-sacrifice as M. JULES SIMON. The Republic has now lasted ten years, but during the greater part of the time the Republic has been only nominal. It was not until after the 16th of May and the fall of the Ministry of MM. BUFFET and FOURTOU that a real Republican Government was established, and on no occasion was the hostility of the Bonapartist section of the magistracy displayed with so much violence and ostentatious illegality as on the eve of and during the elections which decided that France should be Republican. M. DUFAURE himself so recently as last year reminded the Chamber that he and his colleagues had attained power after a struggle which at the time of the elections had almost attained the proportions of a civil war, and that they had discovered that "under the orders of an "active and resolute Government many magistrates had "forgotten the rules of judicial impartiality, and had become mere partisans in the exercise of their functions." Many of these magistrates, indeed, make no pretence of impartiality. They were appointed under the Empire, behaved as the Empire wished, were constantly under inspection, and were regularly reported on to the EMPEROR as displaying, or failing to display, the proper degree of devotion. The Republican Government has not been in a hurry to exercise the right which accrued to it when M. DUFAURE became the first real Republican Minister. In spite of the hostility displayed by numerous judges at the time of the elections which founded the real Republic, the Government waited to see how these hostile judges would behave under a Government which wished to be liberal and indulgent. M. WALDECK-ROUSSEAU affirmed that their behaviour had been such as not only to thwart and embarrass the Government, but to bring the general body of the magistracy into disrepute. Every one agreed that the majority of judges were fair and honourable men, but a minority of violent and partial men had undermined the confidence and respect which it was so desirable that the public should accord to the whole body of the magistracy. It was to recreate afresh the lost respect paid to judges, which it was said could only be secured by judges being irremovable, that the Government at last found itself obliged to do as other Governments had done, and to purify the Bench in its own sense.

Any one who had listened to the debate thus far must have longed above all things for the advent of some speaker who would descend from generals to particulars, and would give specific instances of the bad behaviour of bad judges. M. BOYSSET fulfilled, or endeavoured to fulfil, this task. He gave a series of instances, some of which broke down, but some of which were accepted as worth consideration by the opponents of the Bill. There was a case of a man who was tried for using insulting expressions in reference to President GRÉVY, and he was acquitted; but the tribunal merely decided that he had never used the alleged expressions. In another case, a Préfet had been assaulted, and the assailant was acquitted; but it was shown that the Préfet had struck the man's wife, and the Court held that this was reasonable provocation. These cases, when examined, showed nothing at all against the judges. The most rigid Republicans might have been expected to arrive at the same conclusions. In another case, which, however, M. BOYSSET treated with some confusion and indistinctness, it appeared that a large employer of labour, who had taken a part in a recent municipal election against the Republican candidate, and had been guilty of gross corruption and bribery, had been acquitted in face of the evidence. At Angers the judges, before beginning their sitting, had attended mass in a church where fleurs-de-lys were said to be ostentatiously displayed. The Bishop of ANGERS, who is a member of the Chamber, explained that the fleurs-de-lys were not the real political emblems, but were partly intended to represent the virginity of the VIRGIN, and were partly borrowed from the arms of the town of Angers. He had, however, to own that these emblems were so generally taken to be political that the Republican members of the parquet refused to be present. Then, again, in the judgment of the tribunal of Perpignan, the agent of the Government, who had carried out his instructions in expelling a congregation, was described as a malefactor and a thief, and this judgment before it was registered was communicated by the tribunal to a Bonapartist journal. This was indecent and improper, and it was not surprising that it should have irritated the local Republicans. But the general effect of M. BOYSSET's disclosures was to suggest that specific acts of bad behaviour on the part of judges are hard to find, and that the hostility of anti-Republican judges, if it actually exists on any considerable scale, is displayed in their general demeanour, and in slight acts which, to people who know a locality well, show a bias rather than an open violation of justice.

THE COLSTON SPEECHES.

THE citizens of Bristol are fortunate in possessing a local hero or patron saint who bears testimony, probably without any purpose of his own, to the great truths that there are two sides to a question, and that it is not always necessary to take either side. COLSTON's memory

is year after year simultaneously celebrated by Conservatives and Liberals, while the guests at a third or neutral dinner judiciously abstain from talking politics. The managers naturally exert themselves to secure the attendance of the most considerable members of their respective parties. In the present year the Conservatives were fortunate in obtaining the services of their leader in the House of Commons, while the Cabinet Councils in London compelled the Liberals to content themselves with a highly respectable politician of the second rank. In the peculiar circumstances it was impossible for Mr. OSBORNE MORGAN to answer Sir STAFFORD NORTHCOTE. The "Dolphin" and the "Anchor" Societies are not within hearing of one another, and consequently the representatives of opposite opinions are in the position of hostile champions separated from one another as in an ancient tilt-yard by a longitudinal barrier which prevents a direct encounter. Although, as a general rule, the conflict of arguments may be thought conducive to the eliciting of true results, the comparison of independent statements is also a useful form of political controversy. When two competent speakers severally expound their respective doctrines, they can scarcely fail to throw light on the points at issue between them. It may be collected from the Bristol speeches that on the questions which are immediately urgent there is no violent antagonism between Conservatives and temperate Liberals. Mr. OSBORNE MORGAN did not recommend a war for the aggrandizement of Greece, and Sir STAFFORD NORTHCOTE admitted that an enlargement of Greek territory would be desirable, if it could be peaceably accomplished. The general proposition that the Government ought, to the best of its power, to carry out the Treaty of Berlin will not be denied by those who were vehemently attacked for creating the obligation which is, when convenient, to be discharged.

There is nothing inconsistent in paying a personal tribute to the merits of both the eminent personages who have for many years been the undisputed leaders of the two great parties. Sir STAFFORD NORTHCOTE praised the courage and the skill with which Lord BEACONSFIELD organized and disciplined the followers whom he eventually led to temporary success. As he justly observed, the similar exercise of the same qualities might perhaps lead to a like result; and it was not necessary to remember that the task would require the efforts of another DISRAELI. Since the fall of the late Government the torrent of vituperation which had long been directed against Lord BEACONSFIELD has been dried up or diverted. His adversaries are appeased by the knowledge that he is not likely to head a future reaction against their present supremacy. Mr. OSBORNE MORGAN also began his speech with an enthusiastic eulogy of "that great statesman who, with a fire unquenched by "the snows of seventy winters, had answered a nation's "call, and grasped the rudder of State." He might have added that Mr. GLADSTONE himself evoked the call, and that he thrust aside all competitors for the command of the State rudder. No adverse critic will dispute the fiery energy of the PRIME MINISTER, though domestic and foreign affairs afford at present but doubtful illustrations of his wisdom. Expressions of party loyalty are always becoming, and they conveniently fill up the intervals of practical discussion. It is perhaps not inexpedient that a popular audience should from time to time be reminded of the great influence which personal qualities have exercised on the course of recent history. It is impossible to conjecture the consequences which might have followed from the uncontested predominance of either of the two great rivals; but it may be confidently affirmed that none of their contemporaries could have filled the place of either.

Neither of the COLSTON orators thought it necessary to abstain from the commonplaces which unavoidably constitute the staple of party speeches. Sir STAFFORD NORTHCOTE reproduced at length the just comments which have been made during two or three months on the naval demonstration; and he even thought it worth while to explain, for the twentieth time, that Dulcigno was, according to the text of the Treaty of Berlin, to be surrendered, not by Turkey to Montenegro, but by Montenegro to Turkey. As Dulcigno was by a double process of negotiation substituted for another district which had been assigned to Montenegro, the provisions of the Treaty apply to the territory now in dispute; and the Turkish Government has, in fact, never denied the justice of the claim which it has so long hesitated to satisfy. After all, Sir STAFFORD NORTHCOTE hoped that Dulcigno would be surrendered, though, in the discharge of his duty as a party politician, he implied rather than asserted that the Government was to blame. It is less unstatesmanlike to carp vaguely at the policy of a hostile Ministry than to emulate the factious violence of the late Opposition. No enemy of England will be encouraged, and no ally will be alienated, by the conventional arguments of Sir STAFFORD NORTHCOTE. On Indian policy he was wisely and patriotically silent. The difficulties of the Government are national embarrassments which can only be aggravated by premature censure and unseasonable discussion. On domestic legislation the leader of the Opposition had nothing to say. Mr. OSBORNE MORGAN referred, it may be hoped with laudable brevity, to his own triumph in the matter of the Burials Bill; and he recommended a sweeping change in the laws which regulate the tenure of land. The oddest expression of opinion at either dinner was Mr. SAMUEL MORLEY's demand of protection for sugar refiners against the effect of the perverse French bounties. There seem to have been differences of opinion among the audience; and it is certain that the present Government will not concede Mr. MORLEY's demand. It is curious and instructive to learn how lightly the true economic faith is regarded by some of its professed votaries.

Entering into the spirit of a party banquet, Sir STAFFORD NORTHCOTE was more anxious to taunt the Government with its errors than to suggest a sound policy for Ireland. His references to the reckless language of some of the Ministers were perfectly accurate; but the quotations had been anticipated, and the mischief is done. Mr. OSBORNE MORGAN spoke even more strongly of the crimes of the Irish agitators, and of the duty which devolves on the Government. "When," he said, "they saw "murder and outrage stalking in the noonday undetected, "and, he might almost say, unreproved, when they found "that men of note and position advocated assassination "on the ground that in certain circumstances it might be "necessary, then it was high time for any Government "worthy of the name to remember that there was one "duty which was before and above that of maintaining "and upholding the law, and that was of protecting the "lives of the people, and of maintaining the integrity of "the Empire." A vigorous and distinct declaration in favour of exceptional temporary legislation may compensate for commonplaces in which in other parts of his speech Mr. OSBORNE MORGAN freely indulged. Nothing is more tiresome in ordinary Liberal speeches than the unfounded assertion that the party is too vigorous, too independent, and too original to constitute a mechanical majority. The Liberal of rhetorical fiction is a philosopher, if not a man of genius, who has investigated all political problems for himself, and who consequently finds himself not strictly in accordance with the equally spontaneous convictions of his allies. The Liberal voter or member in real life is one of the most servile of adherents to the stock propositions which are from time to time enunciated by his teachers and repeated by his associates. It is of such materials that constituencies—not to say deliberative assemblies—are necessarily formed, and both Conservatives and Liberals think and speak in flocks. It is but idle flattery to teach one of two organized bodies of partisans that it consists wholly of thoughtful inquirers after truth. It may be the right of Liberals, as Mr. OSBORNE MORGAN affirms, to think for themselves, but it is a right which they seldom exercise. The orator, indeed, proceeded to caution his party not to endanger their political orthodoxy by too much communication with the educated classes. They are not to look to Pall Mall or Piccadilly, but to the great centres of industry—to Birmingham, Manchester, and Bristol. Liverpool, which is even more Conservative than London, is of course excluded from the list of oracular shrines. Mr. GLADSTONE has often laid down the principle that he is not to be judged by his social and intellectual equals, but by blind and devoted disciples. It is probable that Mr. OSBORNE MORGAN would, if he had the choice, rather convince scholars, economists, and men of the world than even the most enlightened artisans; but the enterprise is more arduous, and political power and cultivated intelligence are in modern times effectually dissociated.

THE JEWS IN GERMANY.

It may seem strange that the English, who are not at bottom a tolerant race, should be distinctly in advance of their German relatives in their attitude towards the Jews. Even when they were doing their best to keep Baron Rothschild out of Parliament, Englishmen spoke with genuine reverence of his vast wealth. He was so very rich that he ought to have been an orthodox Christian. Surely Divine grace could not in the end be withheld from a man with such a business. It was necessary to oppose his entry into the House of Commons in the interval; but it was a necessity that gave pain, not pleasure, to those who felt its force. For many years past all that we have done in the way of persecuting the Jews has been to try to convert them; and, though a good deal of money has been spent on this excellent object, we never heard that a single Jew objected to the outlay. Nothing came of the effort, and the Jewish race have always been content to put up with it, on the familiar plea that it pleased us and did not hurt them. Unfortunately, Germany is not precisely a country in which schemes of conversion are likely to make much way. If an English Protestant is troubled at the worldly success of a Hebrew neighbour, he may hope that by the labours of the admirable Society for the Conversion of the Jews his rival may have the veil removed from his eyes and be brought to see the wickedness of underselling an equally eager, but rather less clever, Christian. Herr Stocker, the Court Chaplain who has made himself so especially conspicuous in the *Judenhetze*, has no such resource open to him. The last thing that a German thinks of doing with a Jew is to convert him. The hatred in which the race is now held in Germany is far too practical to be appeased by any such trifle as a change of religion. If the German Jews became Christians to-morrow, they would be equally unpopular, because they would be equally powerful. If they were rather stupid, and not good at making money, and altogether given to lag behind their Christian neighbours, they might be of any religion they liked. Their offence is that in all these respects they are better men than the Christians. They work harder, they earn more, they are sharper to see and seize advantages. If they became Christians, a new reason would have to be found for hating them; but it certainly would be found. At the same time it is prudent not to plume ourselves too much on the superior reasonableness of our attitude towards the Jews, because we have undoubtedly enjoyed an advantage which the Germans have lacked. We had the Roman Catholics to bait, and no one can accuse us of having let this part of our duties go unperformed. Herr Stocker recalls the late Dr. McNeile. The strongest things that have been publicly said against the Jews might be paralleled in the controversial literature of English Protestantism. Nor had Englishmen the same excuse that the Germans have. The Roman Catholics in this country, at the time when the baiting of them was carried to the greatest extent, were neither powerful nor numerous. They did not absorb the business of Protestants, or divert to their own use gains which, but for them, might have fructified in the pockets of men who could have passed an examination in every dark saying in the Apocalypse. It will be time enough to praise ourselves as unmistakably superior to the Germans when we have been exposed to similar temptations.

The *Judenhetze* has now assumed a highly concrete and practical form. According to the Berlin Correspondent of the *Times*, the position of the Jews has lately borne in some cases an unpleasant resemblance to their lot in the middle ages. They are subjected to constant indignities, and though they seem very well able to protect themseves, the fact that they are in a minority makes it difficult to have the means of protecting themselves always at hand. A Jewish volunteer has lately shot his lieutenant. A Jewish passenger in a public conveyance has caned a teacher in a gymnasium. A Jewish student at Göttingen has just killed a Christian fellow-student in a duel. A Jewish merchant has boxed an offending Christian's ears. Of course these little incidents were all preceded by some violent act on the part of the Christian antagonist. The Jews are a great deal too shrewd to quarrel with Christians when the latter give them no provocation. The presence of a Jew in a café or in a railway-carriage seems to be regarded by many persons as a sufficient excuse for turning the conversation to the degraded position and despicable character of this unfortunate race. As there are 400,000 Jews in Germany alone, and 800,000 across the frontier in German Austria, the unfortunate race is not likely to submit to ill treatment calmly. It is fair to say that, so far as the authorities are concerned, the Jews seem to be treated quite fairly. The Jew who punished a Christian in a public conveyance afterwards placed him in the hands of the police, and it is not stated that the police made any difficulties about receiving the charge. The Jewish student who killed a Christian at Göttingen has been liberated on his own recognizances. The persecution is a purely popular one, though it is not perhaps the less annoying on that account.

It usually happens nowadays that even the most irrational persecutors shrink from putting their exact demands on paper. The Germans are in this respect more logical. They know what they want, and they are quite willing that the world should know it too. They have been circulating a petition to Prince Bismarck, in which their modest requests are formulated in the simplest and most childlike fashion. They ask that foreign Jews shall not be allowed to settle in Germany, and that the race shall be excluded from the higher Civil Service, from practising as advocates, from holding judicial positions, and from acting as teachers in schools. The curious feature about this petition is that it says nothing about the career in which Jews have won their greatest successes, and consequently given the greatest offence. Why should a Jew be forbidden to be a tax-gatherer or an usher in a school when he is allowed to make a hundred times as much money in business? The explanation may be that German merchants are too shrewd to ask for impossibilities, and leave that method of opposing the Jews to Professors and Court Chaplains; or that they are afraid of the consequences that might follow if their requests were put into words without being conceded in fact. To have offended all their Jewish fellow-traders, and yet not have deprived them of any of their power of rendering mischief for mischief, would decidedly be a dangerous game. However superior the meanest Christian may feel himself in comparison with a Jew, this superiority does not in the least prevent the Christian from owing the Jew money, or the Jew from holding the Christian's securities. A creditor might not be very accommodating if he had just read a prayer that he should in future be shut out from exercising his calling, and had noticed his debtor's name appended to the petition. It is not likely that Herr Stocker or Professor Treitschke have in this sense gone to the Jews before taking up arms against them. When things have come to this pass, it is plainly time that Parliament should have something to say about them. The Government are about to be asked some question which will give them an opportunity of throwing cold water on the Anti-Jewish movement, and it can hardly be supposed that they will let the occasion slip. In these days Continental sovereigns find the Jews an exceedingly convenient class of subjects. They are of far too much importance, speaking financially, to make any Minister wish to quarrel with them. The authors of the petition will probably be slow to abandon all hope that they will gain their end; but the rejection of their demands will, it may be hoped, be sufficiently decisive to prevent any new adherents from joining them. It is not improbable that this curious wave of reaction and intolerance may be only the dash of cold water thrown on just before the pot boils, and be regarded hereafter as the prelude to a fresh Jewish advance rather than as the signal for any permanent decline.

WATER.

The deputation which waited on the President of the Local Government Board last week had a disastrous story to tell. There was at once a melancholy sameness and a melancholy variety about the statements made by the various speakers. All had to speak of heavy losses, and each district had lost that which it most cared to save. Near Bedford there are ten thousand acres practically under water, and one large farmer is paying rent for many acres which he has not seen for two years. In the valley of the Ouse enough produce to feed thirty thousand head of cattle has been made worthless, and the fertility of the soil is gradually being destroyed by constant soaking. During the past year the death-rate in the town of Huntingdon has been double the normal rate; and in the towns and villages

along the Ouse the inhabitants have again and again had to live in the top stories of their houses, and to have all their provisions brought to them in boats. In the valley of the Avon food to the value of 63,000l. has been destroyed on eighteen miles of ground within the last twelve months, and the hay crop was carried into the sea. These cases are typical of a vast number more. Small losses that make but little figure in themselves may, in the aggregate, represent as much poverty and suffering as more conspicuous calamities. No one can have travelled over the English lowlands during the last six weeks without seeing for himself something of what the floods have done. There is hardly a river which has not overflowed its banks, and wherever that overflow has come there has been loss of produce or loss of time, destruction of wealth actually harvested, or delay in the production of fresh wealth. When crops are carried away or rendered worthless, it means injury to the farmer. When the ground cannot be prepared for new crops, it means injury to the labourer. Our streams are only innocent when they are kept within their natural boundaries; and, with such seasons as we have had of late years, the natural boundaries of many streams are coming to be scarcely known except by tradition.

Mr. DODSON is not the only Minister whose life is made burdensome by the water question. The singular system which makes London a law to itself in sanitary matters commits the question of the London Water Supply to the care of Sir WILLIAM HARCOURT. The Vestries and district Boards of London and its suburbs have appointed delegates to consider the composition of the Water Trust which the Select Committee of last Session recommended should be appointed, and these delegates now ask for an interview with the HOME SECRETARY, at which they may acquaint him with the conclusions they have come to. As is commonly the case, the public have been made acquainted with these views in advance of the Minister. The delegates want a Water Trust, but they object to the particular Water Trust suggested by the Select Committee. They do not wish that the Water Trust should be "filtrated" from the Metropolitan Board of Works and the Corporation of London. Possibly the recollection of the very imperfect results obtained by a similar process as regards the actual water supply may unconsciously have suggested this preference for direct election. The proposal of the delegates is that the water authority should be constructed on a basis as representative as that of the London School Board, and that all the districts supplied by the London Water Companies should have members allotted to them. This Water Trust should be empowered to buy the undertakings of the existing Water Companies, if they can be had on reasonable terms, or, if that proves impossible, to introduce an independent supply. For this purpose the Trust should have full powers to raise capital, impose rates, and "control, in the "interest of the ratepayers, this essential necessary of "life." At this early stage of the proposal it may be enough to point out that life in London is in danger of being seriously embittered by the multiplication of municipal bodies of one sort or another. If the new Water Trust is constituted in the manner proposed by the delegates, Londoners will be in this singular position. One large part of their affairs, including the care of the public health, drainage only excepted, will be in the hands of the Vestries. Another large part, drainage included, will be in the hands of the Metropolitan Board of Works. About the election to these two bodies the average Londoner knows nothing whatever. He is probably ignorant of the names of the vestrymen who are supposed to represent him, of the time when they were elected, and of the time when they will be elected again. All his electioneering interest will be devoted to the periodical creation of two quite different bodies—a Board to look after the supply of water, and a Board to look after the supply of education. As the Corporation of London takes the place of some of these bodies within the City, the result will be that London will be governed by five distinct, and occasionally conflicting, authorities—a state of things which can only be agreeable to the gentlemen who compose the bodies in question.

These two subjects—the supply of water and the prevention of floods—may prove by and by to have a closer mutual connexion than that which is furnished by their being concerned with the same material, or being brought before the notice of the Government about the same time. London, though it is the largest, is not the only, consumer of water. Every other great town either is or has been dissatisfied with the water to be had in its own immediate neighbourhood, and is going, or has already gone, in search of water it likes better. The cause to which the increased prevalence of floods is generally attributed is the improved drainage of land. The water which was once allowed to soak into the soil is now carried off from it, and poured into the rivers in volumes too great for them to carry off. But it is carried off in the end, and, when carried off, is lost. If wet seasons were habitual in this country this consideration might not have much importance. But, though they have been common of late years, they are not the rule. It is quite possible that we may have a succession of droughts as marked as the succession of floods which we have recently witnessed; it is almost certain that on a large average of years the customary proportion between the two will be fairly maintained. Whether floods remain as common as they are now, or are prevented by better arrangements for carrying them away, it seems conceivable, to say the least, that any very large adoption of the practice of bringing water from a distance for the use of great towns may end in something like a water famine to the unfortunate inhabitants of the villages and small towns lying nearer to the source of the supply. Their water will be cut off from them at both ends. The gathering-ground will be drained by London or Manchester, and what little escapes will be swept into the empty channels of the rivers and carried at once into the sea. It seems imperatively necessary, if we are not in remedying one evil to lay the seeds of another, that the Water question should be taken up as a whole at the same time that it is taken up in parts. With such a population as ours even water is not inexhaustible. If we have too much of it at one time or in one place, we may easily have too little of it at another time or in another place. We have seen something already of the mischief that may be done by ill-considered draining—ill-considered, that is, in the sense that the immediate object is pursued to the neglect of more remote objects of equal importance. If, on the one hand, Parliament sets to work to improve the channels of our rivers, to remove obstructions in their course, to buy up the mills that now help to keep the water back, and generally to do all the things that the deputation pressed on Mr. DODSON's attention the other day; and if, on the other hand, it gives power to local authorities everywhere to bring water from any district where water is to be found, without regard to the drought that will be left behind, the consequences may be very much more serious than seems to be supposed. The unfortunate thing is that matters have now come to that pass that any suggestion which points to any considerable further delay is sure to be scouted. When cities like London or Manchester want water, they do not like to be put off with a Royal Commission. Nor do we know that any further evidence on these points remains to be taken. What is wanted is rather such a digest of the testimony already in hand as may give the Government a reasonable confidence that no important fact has been overlooked, and that they can meet Parliament with a full and precise statement of what it is that needs to be done. The situation and extent of our chief sources of supply, the possibility of making the inhabitants of the places in the neighbourhood of the gathering-grounds independent of any loss caused by the diversion of their contents, the extent to which river-water can any longer be safely used for drinking, the possibility of utilizing rain-water on a large scale—these are the points upon which the Government ought to have information; and we are inclined to think that, if two or three competent public servants were appointed to digest and draw inferences from the materials already brought together, the preparation of a really useful body of legislation on the subject need not be long delayed. Even the delay of a year or two would be preferable to the discovery that our whole action in relation to water supply had been a series of costly blunders.

CONTINENTAL TRAVEL.

THE palmy days of innkeeping, when in August or September travellers often had to implore shelter, and assert with the most pathetic fervour their readiness to sleep in the *salle-à-manger*, the reading-room, or indeed in any place where they would be under cover, are passed, and, except in one or two happy spots,

do not seem likely to recur; but probably the hotel-keepers on the great routes and in the districts frequented by tourists have done well during the autumn season which has just closed, and, though not proud and joyous as they were in the days when they sternly ruled submissive guests, have no reason to be discontented with the custom they have received either this or last year, and probably consider that things are, on the whole, well ordered in a respectable world. Whether travellers have much reason for content is unfortunately a different question. Those people, for the most part very young, to whom foreign travel is entirely new, of course find enjoyment everywhere, and are indifferent to discomfort; but those who have experience of the Continent, and have journeyed in the frequented countries during the last two or three seasons, must have perceived that, notwithstanding some recent improvements, travel is not becoming, on the whole, easier, and that, despite the lesson which has been read to extortionate landlords, it is likely to become more expensive. That there have of late been some alterations for the better may be freely acknowledged. Sleeping-carriages, which have long been running in Germany, have at last been fully accepted by some of the great French Companies, and though the tariff for them is in many cases exorbitant, the facilities for using them are being increased. Under a Republic the marvellous tyranny which railway officials were wont to show has been tempered. On the line which is taken by most of those who go to the South, travellers are no longer treated as if they were convicts, and the Company has actually pushed its liberality so far as to refrain from penning them up, and to allow them to walk about the platforms. It is true that the permission is given with fear and trembling, and is fenced round with precautions much resembling those which in England are addressed to little boys who are going out by themselves; but still it is, for so conservative a Company, a considerable concession. With inns, as with French railways, there has been some amelioration. Hotel accommodation has been extended, and places which formerly had to be avoided by all but those who were very hardy can now be visited in comparative comfort. Knowledge of English has, owing principally to the Americans, extended in a marvellous manner, and the traveller who is a good linguist often finds that he is scarcely allowed to speak the language of the country in which he is sojourning. There is almost everywhere some attempt at cleanliness, and some deference is now generally shown to what are regarded as the peculiar prejudices of Englishmen. The ways of British and American tourists are more thoroughly understood than they were, and the effort to please them is more intelligent.

But, if there has been a slight improvement in some respects, in others there seems to have been a change for the worse. If in France railways are a little more comfortable than they were, those in Italy, where the number of English travellers is now so very large, seem to be, if possible, worse than ever. The management of most of the lines is marked by all the faults of the French railway system, but by none of its merits. The officials are often peremptory in the extreme, the trains are now usually crowded, and the carriages are uncomfortable and sometimes filthy. These annoyances, though not inconsiderable, might be cheerfully endured if there was fair punctuality. This, however, seems scarcely to be thought of on many Italian lines. Long as are the periods allowed for the journeys, the trains are usually behind time. For some incomprehensible reason it is the delight of Italian managers to fix long stoppages at many stations where there is but little traffic. These stoppages it is the delight of station-masters and guards to protract, and they seem specially to take pleasure in prolonging them when the train is late. Who that has travelled much in Italy does not recall those long and weary halts at wayside stations? The train, which is fifty minutes or so late, slackens most gradually its very moderate speed, and at last draws up before the rickety little building in front of which a dirty official is standing. One second-class passenger with a small hand-bag gets out, and another gets in. There is no luggage to load or unload, and it is fondly hoped that the train will go on; but this does not happen. The station-master converses with the guards, the engine-driver with some local friends. One of the guards relieves his feelings at intervals by crying out "Partenza!" and then resumes the thread of his discourse. If any unfortunate people get down, they are savagely driven back again; but still the train remains stationary. When at last it makes its creaking way out, the unnecessarily long period allowed for the halt has been largely exceeded, and the probable time of arrival at the terminus made yet more painfully obscure than it was. That such dawdling is common in Italy, and that it is typical of the general spirit of unpunctuality which prevails, will hardly be denied by any one who knows much of the country. Of course with some trains more care is taken; but there is, on the whole, great carelessness, and great discomfort in consequence. In fact, it may be said that the Italian railways are to those of France and Germany as the London and South-Western is to the Northern lines; and, besides being unpunctual, Italian trains sometimes start at the most inconvenient hours. The comfort of travellers seems to be utterly disregarded, and probably those who arrange the times never give a thought to it, but consider only what will best suit the Railway Company. The discomfort caused by crowded carriages, unpunctuality, and inconvenient times of departure is not inconsiderable; but it is a small matter compared with a much graver evil which too often afflicts travellers in Italy, and which seems to have increased of late. Robbery appears now to be more frequent than ever, and thieves occasionally show an audacity which strongly argues the connivance of the officials. By no small troubles, then, is the traveller in the much-sought country now beset, and these seem lately to have grown greater rather than less.

Good hotels are even more desired by the wanderer than quick and punctual trains; and hotels, both in Italy and elsewhere, have latterly, as has been said above, improved a little in some respects, but in others they have certainly deteriorated. In the first place, there is the painful monotony of modern inns which grows more marked every year. Hotels now are built on the same plan, furnished in the same way, and have similar *menus*, similar German waiters, and similar dining and sitting rooms all over Europe. In the house in which the traveller stops there is nothing, or scarcely anything, to suggest to him the country he is sojourning in. An hotel in one great city is exactly like an hotel in another great city. This was not so formerly, when one of the pleasant things in travelling in some parts of Europe was to observe the difference in national habits as shown by the customs of good old-fashioned inns. This monotony certainly detracts from the enjoyment of travel, one of the principal objects of which is variety; but it might easily be tolerated if uniformity had brought excellence. Unfortunately this is not the case, uniformity having in some respects made things worse instead of better. It is tiresome to have to eat the same dinner all over Europe; but it is more than tiresome when that dinner is a bad one. In other days the table-d'hôte frequently offered the traveller an excellent meal. There were local dishes, often accompanied by good local wines. Now the special aim of the hotel manager seems to be to exclude anything peculiar to the national *cuisine*, and to give only those dishes which can be got anywhere. These are usually composed of very bad materials. Formerly the best food in the market was often bought by hotel-keepers, but now the cheapest is generally taken. This is disguised by those wonderful sauces which are so precisely alike everywhere as to encourage the supposition that they are made at some central factory, and thence despatched all over Europe. In nothing has there been so much falling off as in the Continental table-d'hôte, and of late this has been specially marked. Some hotels keep up their reputation; but, as a rule, the "ordinary" grows more monotonous and worse every season; and, after all, dinner is an important incident in travel. The wine which has to be drunk is also a matter of some importance to the traveller; and the more so that the water at hotels is sometimes more dangerous than British gin or Boulevard absinthe, and that death may lurk, it seems, even in the apparently harmless siphon. With regard to wine, hotel-keepers are apparently incorrigible, and, indeed, so covetous in penny-wise fashion as to be blind to their own interests. They expect to make a large profit on it, and in this perhaps they are justified; but the profit which they consider a proper one is so enormous as to make their trade in wine much smaller than it might be. They cannot grasp the very simple fact that, if the price of an article is raised beyond a certain point, the consumption is checked. The poorest and cheapest wine is generally bought, and, re-christened with high-sounding names, is offered at high prices in the extremely untruthful *carte des vins*. Travellers find that they have to pay a great deal for wretched stuff, and accordingly drink as little as possible. Not long ago a German sitting next to an Englishman at a table-d'hôte observed, "I have never been in England, sir, but I have travelled much in Europe, and I cannot imagine why your countrymen are said to be large wine-drinkers. They have always seemed to me extremely moderate. Look round this table, now." The German was quite right so far as his observation went. Generally speaking, not much wine is consumed at hotels, because it is so dear and so abominable. No doubt in one respect a good result is produced; but abroad, as at home, all but a few fanatics think good wine in moderation desirable, and at most hotels this is not to be obtained save at exorbitant prices. Very often even those who are willing to pay exorbitant prices find merely that they have been more cheated than the rest. Some time ago we spoke of the foolish covetousness of landlords in this respect, and since then their ideas of what they should supply to their guests seem to have sunk lower and lower. Just now the unfortunate traveller is being told with great emphasis that he must avoid water and aërated water. Both contain the germs of typhoid, and the latter in addition is charged with lead. His position, therefore, when he has to decide what he will drink at dinner, is not a pleasant one. He has to choose between harsh, crude stuff at huge prices, and liquids which he formerly believed to be innocuous, but now knows to be dangerous in the extreme. The badness of the wines supplied at hotels is a very unpleasant fact in modern travel, and is certainly made the more trying by painful revelations respecting the true character of what were thought to be innocent fluids.

Charges generally do not appear to have risen much during the last two or three seasons, landlords having learnt the lesson which was taught them by the significant paucity of travellers a few years ago. It seems, however, at present not unlikely that before long prices will be quietly augmented. If a gold currency is established in Italy, the practical effect will be to raise hotel charges ten or twelve per cent. The rapacity of servants constantly increases, and the unfortunate tourist suffers more and more each season from the array of expectant faces which surround him as he quits his hotel, having, it is to be observed, paid largely for service already. Apart from

hotel charges and extortions, other demands on him constantly increase. In the travelled parts of Europe a very considerable number of people, besides innkeepers and their servants, now live entirely or principally on what they make out of travellers. As these, like the rest of the world, are constantly striving to increase their earnings, the tax on the traveller is steadily raised. Of the abominable extortion which is too often practised in case of serious illness or death we will not now speak, as we do not wish to deal with the tragic part of the subject. Of petty troubles there are many, and a diminution of them seems in no way probable. Despite the marvellous facilities which are now afforded for making long journeys, and the existence everywhere of big hotels with English-speaking waiters, the much harassed tourist too often feels that travel is not a little trying, and, on the whole, is certainly not growing easier or pleasanter than it was.

POLITICAL CLUBS.

THE outside world is very much less apt to consider the occasions of vacation speeches than the speeches themselves. There are not improbably several earnest politicians in England who have read the speeches of Mr. Bright and Mr. Chamberlain last Tuesday, or who at any rate have read articles about those speeches, and who yet would be puzzled to say what was the particular purpose which took, or was supposed to take, Mr. Chamberlain and Mr. Bright to Birmingham. Very matter-of-fact or very cynical persons might say that the President of the Board of Trade and the Chancellor of the Duchy of Lancaster went down to the distinguished town which they so worthily represent for the purpose of making speeches which should console extreme Radicals for the speeches of Mr. Gladstone and Lord Selborne the week before. Perhaps, as is usually the case when matter-of-factness and cynicism coincide in their conclusions, the actual *causa causans* of the speeches would be not inaccurately indicated by this hypothesis. Ostensibly, however, Mr. Chamberlain and Mr. Bright went to open—we are glad to salute Mr. Bright on his protest against the silly word "inaugurate"—a Junior Liberal Club at Birmingham. It might have been thought that active persons of various nationalities and classes—from Mayors and members of Parliament down to mysterious election managers, such as the person whom Birmingham lent the other day to Oxford in order that he might show the Oxford Liberals how to conduct elections—had already resorted to every possible plan for binding down the Midland town inextricably in their toils. But the wise know that in political management there is no such thing as finality. It is not enough to have Mayors and Town Councillors at one end of the scale, and at the other end artful agents, who disguise their understrappers as ardent Tories and send them about in low public-houses to discover, and perhaps to create, treating and such misdemeanours. For, with some fifteen thousand voters ready in the blindness of their eyes and the stubbornness of their hearts to vote against the truth, it is evidently dangerous to relax. So Birmingham has set up a Junior Liberal Club, just as several other large towns have set up Junior Liberal Clubs, and, for the matter of that, Junior Conservative Clubs too. It is intended for those "who do not care or cannot afford to belong to more expensive institutions, and especially for members of the Liberal party." The last clause expresses the generous sentiments of the promoters. Access to politics and "provant," as Captain Dalgetty would put it, of exceptional purity at a cheap rate, is not to be limited to professing Liberals. The little Conservative children are to be suffered to come in, and if by any chance the comforts and advantages inseparable from adoption of the right side should happen to convert them, so much the better. A wide toleration is one of the most honourable boasts of the party, and it is gratifying to observe that the principle has been recognized by the founders of the Birmingham Junior Liberal Club.

The speakers, to do them justice, did not entirely neglect the subject. When Mr. Bright was not dancing on the Irish landowner, or demonstrating that the House of Lords is the root of all political evil, he said several things about the Liberal Club and other clubs. When Mr. Chamberlain was not descanting on the magnificent success of the naval demonstration, or horrifying his æsthetic hearers by describing an imaginary bombardment of the Parthenon, he took occasion to refer to the "great instrument that had been forged" for the purpose, among other things, of making him President of the Board of Trade, and to point out what an important part in the forging was borne by political associations. But in this and in other matters the elder politician was the chief speaker. Mr. Bright joins issue broadly and generally with those who say that clubs are not good places for young men to belong to, and we certainly have no intention of differing with him on this point. He thinks that, if clubs lead their frequenters into a danger of spending their evenings in a manner not specially profitable, the same may be said of a good many other things and institutions, which is undoubtedly true. But of course Mr. Bright, though he is not a speaker wholly proof against fallacies, knew better than to suppose that the essence of the Junior Liberal Club was conviviality. In such places society and social amusements are merely means, more or less avowed, to an end, and that end is political organization. The Junior Liberal Club of a place like Birmingham or Manchester has but a very faint resemblance to the political clubs in the neighbourhood of Pall Mall. For the most part, the members of the latter are Conservatives or Liberals before they join; the object of the Birmingham Junior Liberal Club is almost avowedly to make or keep its members Liberal. This is delicately represented by Mr. Bright as a contribution to a good object. He "knows nothing more useful to a young man than to occupy his mind at some portion of the day or week with the consideration of public questions, and to try to fill himself with a strong interest in what so much concerns himself and his countrymen." The syllogism is of course obvious, and the conclusion follows if the premisses be granted. What Mr. Bright says is useful, certainly is useful; and if the Junior Liberal Club conduces to this end, then the Junior Liberal Club is an excellent institution. But, it seems, Mr. Bright does not wish that anybody should join such a club "merely to become a more efficient member of a party, that he may partake in party fights and in the glorification of party victories." It is only that he may become a better man and a better patriot. Besides, he will not always be a young man, and it seems very important to Mr. Bright that he should be trained early in the right way. Therefore, all these things being considered, Mr. Bright seems to think that he can recommend the Junior Liberal Club to anxious mothers with some confidence.

Let us see how far these arguments will hold water. The question is one of which it can be said, with very much less than the usual hypocrisy of the remark, that it is not a party question. As soon as one party adopts means of this kind, the other is bound to follow; and we are rather inclined to think that, in Lancashire at any rate, Tory clubs of this kind were not uncommon before the opposite side perceived the necessity of going and doing likewise. Of course if a junior political club of the Birmingham type were the sort of place which Mr. Bright's words picture it as being, there would be very little to be said against it. But, as a matter of fact, it rather seems likely to develop, and, what is more, is usually intended by its promoters to do nothing else than develop, the very tendencies which Mr. Bright deprecates. It does make its members, of whatever political complexion, members of a party and partakers in the glorification of party victories. Indeed it does very little else. We may take an illustration from the speeches of that very evening. Mr. Chamberlain said, and was cheered to the echo by the young persons who, according to Mr. Bright, are to be devoted by the Junior Liberal Club's influence to the intelligent consideration of public questions, that the recent troubles on the North-West frontier of India were due to "a wanton invasion of Afghanistan." Of course when Mr. Chamberlain says this, he says it with the fullest knowledge of the facts, and expresses, possibly in somewhat strong language, a conclusion which he has the right to form. A very great many persons, also possessed of the fullest knowledge of the facts, would say, and would be equally justified in saying, that these troubles were due to the culpable inaction of Mr. Chamberlain's present chief and his then colleagues seven years ago. Does Mr. Bright think that the atmosphere of the Junior Liberal Club is favourable to the investigation of these rival views on their merits by the members? If he were in a tolerably calm mood, and if Providence mercifully permitted him to forget for a moment the existence of peers, bishops, and other cankers of the State and of his own peace of mind, he would probably admit, candidly enough, that it is likely to be very much the reverse. The wanton invasion of Afghanistan probably presents itself to the mind of the average member as an accepted fact, as unchallengeable as the multiplication table. His business is to accept all those things which the heads of the party tell him, to cheer and repeat them lustily, and to vote straight and get other people to vote straight. That is the principle of all political clubs, and we are inclined to think that a member of the Junior Liberal Club who began to examine matters for himself, and to be a political eclectic, would, unless reticence and the Ballot hid his false-brotherhood, speedily find the club a more or less uncomfortable place of resort. To politicians like Mr. Bright and Mr. Gladstone himself, who have an unlimited and sublime faith in the coincidence of their party views with the requirements of abstract truth and justice, this may seem immaterial. The man who votes with the party is sure to be right, the man who votes against the party wrong. But to people who cannot quite adopt this comfortable creed, political associations, and especially political clubs, are perhaps not quite such cheering signs of the times. Already a great, if not a surprising, incapacity to appreciate the value of any political fact or situation is apparent in the new constituencies. Political clubs seem best suited for organizing this incapacity, and rendering it still more formidable. Perhaps Mr. Chamberlain's phrase of "forging" was happier than he knew it to be. For the verb has a double sense, and, in the second and less favourable acceptation, a national vote procured by an immense organization of clubs may certainly be said to be forged. It is not in any way genuine or spontaneous, it does not represent the intelligence, and hardly even the desires, of the individual voter; it becomes, the more it is perfected, the expression merely of the will of wire-pullers and cliques.

Bad as the system is, however, it is one which, like a good many other bad things, can only be fought with its own weapons. There is nothing for anybody to do but, as has been said already, to go and do likewise, while it is time. With his usual frankness, Mr. Chamberlain has already pointed out that there may not be so very much time. The great forged instrument is to be used, he tells us, so as to make a recurrence of the events of 1874-9 im-

possible—that is to say, the franchise and the distribution of seats are to be so manipulated as to give Mr. Chamberlain's party a permanent lease of power. Much of this, doubtless, is mere brag, and much of it the expression of the wishes of a small section of the Government, and a still smaller section in Parliament and the nation. But these sections, if the smallest, are also the most active, and have the great advantage of knowing what they want, and of being perfectly unscrupulous as to the means by which it is to be obtained. It is all the more necessary to fight these persons with such of their own weapons as are not discreditable to handle, because there seems to be in English politics a growing spirit of mere partisanship, as distinguished from the older party spirit. The last election showed the existence of a desire to be on the winning side merely because it was the winning side, which, unpleasant feature as it is, has to be reckoned with. By and by, no doubt, as things always happen, so they will happen at Birmingham. The presiding spirits of the Radical ring will be less active or less intelligent. Discord will arise in the camp, and the enemy will carry the stronghold. But, if it be so, it will be because means to the end have not been neglected. The great constituencies which now exist, and which we may expect to see multiplied sooner or later, offer such temptations to organizers that they are certain to be organized. Whatever faults we may find with the system of organization, it is desirable for national, and not for party reasons, that it should not be all on one side.

THE LUXURIES OF ILLNESS.

MANY writers have observed that it is possible to indulge grief to such a point that it becomes a luxury; but we do not think that the luxuries of illness have met with as much attention as they deserve. Invalids may object that the very idea of comfort and pleasure in connexion with illness is a delusion and a mockery, but perhaps they may change their minds on reflection. It would, of course, be impossible to pretend that a distressing cough, a burning fever, an attack of gout, or a fit of sea-sickness is a luxury in any sense of the word, however strained; and it might, on the other hand, be urged, with a great show of reason, that any luxuries which may be enjoyed during ill-health are luxuries not of illness, but of the cessation, or at any rate the decrease, of illness. At first sight, therefore, it might appear that he who writes of the luxury of illness writes of a thing which does not exist.

We are inclined to believe that very few people really know when they are enjoying themselves. Many persons suppose themselves to be supremely happy when they are partaking of amusements which afford them little pleasure, and imagine themselves to be undergoing a sort of semi-martyrdom when they are in reality pleasing themselves according to their own tastes. Now people who have time to be ill often enjoy themselves in no mean degree without knowing it. Even if we were to allow that the only pleasures experienced during ill-health arise from the alleviation of illness, we still think we could prove our case; for the pleasurable sensation of relief from pain or fever cannot be enjoyed by those who have had neither fever nor pain, and it is something quite different from the ordinary pleasures of health. Mere absence of pain is usually unnoticed; relief from pain is sometimes ecstasy. It may be open to question whether it is worth suffering pain in order to enjoy the relief which ensues when it ceases; but when we have paid the price, it is highly desirable that we should get as much pleasure as possible in return for our suffering. The exorbitant premium which has to be given in advance for enjoyment of relief from pain does not prevent that enjoyment from being a distinct and a special pleasure, and a pleasure unobtainable in any other manner. In other ways also these are pleasures peculiar to illness. One of the highest enjoyments in life to certain temperaments is the receipt of sympathy, and we get more sympathy when suffering from illness than when enduring any other misfortune. If we lose our money, or have the ill-luck to offend a powerful patron, our friends are not usually sympathetic or attentive, although our sufferings under these circumstances may be much greater than in an illness. An invalid feels flattered by the constant messages of inquiry which are certain to arrive if he is rich. People whom he least expected to take any interest in his health call to inquire as to his progress; men whom he had hitherto supposed to regard him with dislike come frequently to hear the latest bulletin; and great ladies, who would, he thought, forget his existence unless he constantly reminded them of it, drive to his door to leave cards of inquiry. He begins to think that this is not such a wicked world after all; he forgives his enemies who have called to inquire for him, and he becomes a believer in the reality of friendship. If he is pleased with others, he is still better pleased with himself, for he reflects with satisfaction upon his evident popularity. His female belongings help to confirm him in these notions. They say, "I met So-and-so to-day, and he made a great many inquiries about you, and seemed very anxious to know when you would be well"; or "Lady —— called this afternoon, and said that everybody was talking about your illness, and that she had never heard so much sympathy expressed for any one." The wife and sisters read to the patient pretty little extracts from feminine letters, and perhaps sympathetic little paragraphs about his health from the local journals. All this can scarcely fail to give him more or less pleasure and satisfaction. He feels that everybody is a good fellow, and that he himself must be the best of good fellows, which is surely a very happy condition of mind for a man to be in. It does not in the least signify that among his friends at his clubs the mention of his illness merely excites interest in the questions of the disposal, in case of his death, of his property, his seat in Parliament, or his appointment; that the world does not care a straw about his aches and his pains, or whether he has had a good night or been able to eat his dinner; that outside his own family his death would only be regretted by the Insurance Companies; that many of the cards of inquiry are left at his house with a view to obtaining cards of invitation on his return to health, and that the most tender words of sympathy expressed by any of his male friends are "poor devil." It is enough that the invalid in his room hears of nothing but kindness, and he can hardly fail to be gratified thereby.

Under certain conditions there is something nearly allied to luxury in weakness and enforced idleness. Italians are not the only people who appreciate the pleasure of doing nothing; but in our climate a somewhat unnatural state of health is necessary for its thorough enjoyment. Inactivity is irksome when we have a restless desire to be doing something; but when neither pain nor fever torments us, we may enjoy considerable luxury in simply lying in bed with reduced energies. Nature then tells us that we require rest and repose, and we experience satisfaction in obtaining them. An illness not unfrequently follows overwork, and the consequent idleness which then becomes necessary is singularly grateful. There is a highly satisfactory feeling, under such circumstances, that to do nothing is, so to speak, to do one's highest duty. There are many people whose natural inclinations are strongly averse to activity, trouble, and even to serious thought; and to such as these there is something highly delightful in being peremptorily ordered by a physician to abstain from all exertion, to keep the mind free from cares and anxieties, and on no account to study. They are especially gratified at the reflection that the strict fulfilment of this injunction becomes a moral duty of a high order. They follow the rule of life laid down for them with saint-like obedience and religious scrupulosity. Here are their ascetic instructions. On no account to rise too early; to take a cup of tea before getting out of bed, a little fresh air after breakfast, a glass of wine and some beef tea at eleven, a drive after luncheon, a couple of hours' repose on a bed or sofa in the afternoon, plenty of good food, a rich vintage claret—no light washy Gladstone; to smoke in moderation, and to keep the mind amused. A still greater luxury enjoyed by the invalid is the privilege of never being crossed or thwarted. The doctor says that serious consequences might follow if he were to be annoyed or worried, and his family and friends have to take care accordingly. The able physician even goes so far as to say that it may be better to allow him to have or to do certain things which are not, strictly speaking, desirable for him, rather than that he should be put out of humour or get excited. He must on no consideration be bored. He had better not go to church; he might get hot when in the building, and cold when he came out, and, in his present state of health, the length of the service might weary him. Theatres of course would not be desirable, but if he sets his mind very much upon going to one, it might perhaps be better not to thwart him. He may see a few friends who are likely to amuse him, but he had better not see the clergyman until he is stronger. He must not write letters at present; another member of his family had better do this for him. He must certainly not be troubled with any business matters, but somebody ought carefully to attend to them for him during his illness and convalescence, because a complete relapse might ensue if he were to find an accumulation of business matters and letters awaiting him on partially regaining his strength. We need scarcely say that the patient is not likely to find it either difficult or unpleasant to do his duty in such a state of life. Another luxury of illness is the colourable excuse which it affords for extravagance. We may be living in a tolerably economical manner in order to provide fortunes for our younger children, to build a church, or to bring about some other good object; but when we are invalided, it becomes our pleasing duty to spend our money on ourselves and our personal luxuries, and we virtuously do this without the slightest qualm of conscience. It is our bounden duty, both to ourselves and to everybody else, to endeavour to get well, and our first efforts must be directed towards this object. It was very right and proper that we should lay by money and deny ourselves when we were in good health; but now it is incumbent upon us to treat ourselves, however unwillingly, to foreign tours, Château Lafitte, "C" springed barouches, and possibly steam-yachts. Such expenditures have even an aspect of economy about them; for are they not made with a view to prolonging our lives, and what is so valuable as life? We argue, with much reason, that it is better that we should spend our money on fruit and game even at their highest prices than on physic; we pitifully submit that it would be hard indeed if we could not have our garden made nice when we have only sufficient strength to walk within a couple of hundred yards of the hall door, or if we could not have our conservatory filled with tropical plants, when we cannot leave the house for several months during the winter. We are so reduced by ill-health that our only amusement consists in our pictures; so we have to content ourselves by covering our walls with Turners, Landseers, and Linnels, and surely a few choice water-colour drawings are an innocent amusement for the poor sick man. The invalid is too delicate to go during the winter

months to his parish church, so he builds himself a beautiful Gothic chapel, communicating with the house by means of a passage warmed with hot pipes. This lovely little edifice, with its marbles, its stained glass, its carvings in wood and stone, and its well-toned organ, is of course a pure act of piety, and goes down to "charities." It is a very pretty addition to the house all the same.

It is a merciful provision of Providence that a certain cheerfulness should often accompany serious and even fatal illnesses. Most medical men will bear us out in saying that, when consumptive patients have been informed that they must not hope to recover, they generally become cheerful and reconciled in a wonderfully short space of time. The first shock is naturally a painful one, but in most cases the patient can hardly help feeling that he will not recover before the information is formally given to him. After all, when death is not likely to come to-day or to-morrow, or this week or next week, it still seems a long way off, and it is far from impossible that the doctor who tells us our fate may even yet die before us. The cheerfulness of very old people who do not suffer from any of the unpleasant accompaniments of age has often been noticed. The probable cause of this cheerfulness consists in their freedom from the anxieties of further ambition and labour. In the same manner, invalids who are aware that their lives will probably terminate in a few months feel that they may take their ease, as the work of their life is over, and the hopes and fears of this world need no longer make them anxious. They then often yield themselves to a lethargic contentment and resignation to which luxury is not altogether a stranger. Every one around them is striving to make them happy, and sympathy, comforts, and kindnesses are showered upon them. They have no cares, no worries; the nights may be long and the cough may be distressing, but the gradually increasing weakness becomes so natural by habit, that it is almost a relief to submit to it, and at last the patient scarcely struggles against the failing of his powers.

We need not be told that there is another side of the question. We are fully aware of this fact. Most matters appear different when viewed from various aspects; but on the adverse side of the subject before us we decline to look at present.

SCHOOLMASTERS AND CRAMMERS.

AMONG the abominable devices of the late Government was the introduction of "Protection" instead of "Free-trade" principles into the examinations for the Indian Civil Service. This is the grave charge brought by Mr. Walter Wren, using language supplied by a leading article in the *Guardian*, against the innovations of Lord Salisbury. Mr. Wren had a brief chance of asserting the dignity and righteousness of Free-trade in the House of Commons; but the unfortunately venal condition of the borough of Wallingford, for which he sat, has relegated him to private life, and obliged him to defend Free-trade and his private interests in the columns of the *Guardian*. Those columns have lately been the field of a free and rather interesting scuffle between public schoolmasters and crammers. In using the technical word "crammer," we must guard ourselves against being supposed to have any invidious meaning. Very probably the gentlemen who prepare private pupils for special examinations are tutors or teachers in the noblest sense of the word. Their system may be as wide, liberal, and free from sordid regard of anything but pure education as the system on which Ponocrates trained Gargantua. But the poverty of the English language provides no name for these instructors but "crammers." "Coach," however dignified, is appropriated by a peculiar class of University teachers. "Private tutors" are not generally understood to prepare their pupils for any single special examination. If you ask a lad who has left school to be instructed specially for the Indian Civil Service or for the army what he is doing, he will reply that he is "at a crammer's." Therefore we must be understood to use the term "crammer," not as begging the question, but as the recognized title applied to a particular set of teachers called into existence by the competitive system.

Having thus cleared the ground, we may return to the war between public and private teachers. For many years previously to 1878 the first examinations for the Indian Civil Service were open to any candidate under twenty-one years of age. In 1878 the limit of age was lowered from twenty-one to nineteen years. To ourselves it seems that there are good and bad features in this change. The schoolmasters, however, see little but good in it; the private teachers see nothing but harm. The interests of both are affected; those of the schoolmasters favourably, those of the private teachers, or so Mr. Wren thinks, unfavourably. Boys do not stay at school till they are twenty-one; and, under the old system, those who desired Indian appointments went, say, at the age of eighteen, from school to the private teacher, generally resident in or near London. Now the schoolmasters would have been glad, for various reasons, most of them obvious, to keep the clever boys of eighteen for another year. It must also be said that there was among parents, and even among candidates, a very strong prejudice against the sort of life led by some pupils of some private teachers. Young men, by no means prudish, described that life as a kind of cross between the monotonous career of a mill-horse and the rowdiest existence of medical students. Mr. Scoones, a well-known and successful teacher, remarks in the *Guardian* of November 17, that, in his experience, "candidates have either resided with their parents in London, or in batches of three or four in the houses of lecturers, who exercised strict supervision over them." But the opinion prevailed that in certain notorious cases no moral supervision whatever was exercised. Public schools are not precisely the last refuges of Astræa, but, masters and parents, and boys of decent manners and tastes, had some reason to dislike the sort of "life at a crammer's" which was popularly supposed to be not absolutely unknown. Thus the schoolmasters had at least a show of right on their side when they wished boys to go straight from school to the examination. On the other hand, it is plain that nineteen is a very early age to endure the labour and anxiety of an examination on which depends a man's whole fortune and career. Yet Dr. Percival, in a letter published by the *Guardian* (November 10), remarks that, under the new system, boys will go out "younger, fresher, incomparably less jaded, than under the old system." Younger, certainly they will be; indeed, considering the nature of their duties, they may be rather too young. Mr. Scoones speaks of a boy who recently started for India "to assume junior magisterial functions long before he had attained his own majority." Still, most of the lads before they begin to govern India have attained the age at which they may lawfully enter the Legislature. As to Dr. Percival's statement that the younger candidates are "less jaded" than the elder men were, we agree with Mr. Scoones that the former system may well have been the healthier. In work, as in play, a man of twenty-one can stand more labour than a lad of nineteen. So far, then, there seem to be advantages on both sides; though, on the whole, we rather prefer the old system. Parents, if they were alarmed about their sons' morals, could seek out teachers not indifferent on the subject. But, in this affair as in others, *rien n'est sacré pour un père de famille*. If our ghostly foe had the reputation of "passing" his pupils, he would be in immense request as a crammer.

There was a necessary consequence of the alteration of the limit of age. Intellectual work that was fitted for men of twenty and twenty-one was not fitted for boys of eighteen and nineteen. The nature of the studies was altered. Here, again, Mr. Wren can raise his war-whoop of "protection." He says that the headmasters asked Lord Salisbury for "exclusion of subjects they could not teach, and 'special prominence' to the subjects they can" (*Guardian*, November 3). Who can say what a headmaster cannot teach? That august being may have "learned the art that none can name, in Padua far beyond the sea"; or he may even be conversant with "moral science," which is of little value, Mr. Scoones complains, under the new system. On the other hand, the schoolmasters obviously believe that under the old system moral science was purely theoretical, and was allowed by some crammers to have no bearing on practice. It might be more fair to say that the schoolmasters suggested studies within the reach of the faculties of boys than that they demanded "protection" for the subjects they could teach and restriction on the subjects in which they were unable to instruct. But, as Mr. Wren insists on making the question very much one of personal and pecuniary interests, we must admit that we scarcely see how he is a loser. "The reduction of the limits of age prevents any but schoolboys from competing," he says (*Guardian*, November 3). But why should not lads from seventeen to nineteen years of age enjoy the advantage of Mr. Wren's acknowledged skill in teaching? Boys as young are their own masters at the Scotch, and even in many cases at the English, Universities. And, if the topics in which lads are examined are changed, are we to suppose that Mr. Wren and his staff are incapable of tackling the new subjects? He avers that boys can read far more cheaply with him than they can at the public schools. Dr. Percival, on the other hand, says that "the schools offer cheaper education and a healthier life." But, if Mr. Wren is right, if he really can undersell his competitors, and if, as he asserts, he is so much more successful than they, of what is it that he complains? What is the meaning of these commercial lamentations about protection? The whole paper war seems to have arisen out of the removal of a boy from Clifton to Mr. Wren's establishment. There appears to be no reason, in the new system, why all the public schoolboys for whom Mr. Wren has room should not desert Rugby and Marlborough to place themselves in his hands. The only practical reason for keeping them at school is the possible superiority of school teaching in the new subjects. Does Mr. Wren doubt his ability to beat the schools at their own work? He seems to suffer from no such diffidence. "The work we are paid to do we do," he cries with honest resolution. We really think that his commercial are as fallacious as his theological reasons for opposing the new system. He appears to hold that the advocates of the new system aimed at favouring Churchmen, to the disadvantage of those suffering lambs, the Nonconformists. Of the two, we imagine that Nonconformists would be the more ready to place their offspring under Mr. Wren's moral and intellectual supervision, and, therefore, to secure appointments. Mr. Wren, at least, is not, like so many headmasters, a clergyman of the Church of England.

It is a relief to turn from what is more or less a personal question to a letter in which Mr. Scoones exposes what he believes to be the defects of the new system of examinations. Here we leave money matters and come to education. Mr. Scoones thinks that the old secured a better education than the new system. We confess that we are only partly persuaded by his arguments. Under the old rules, he says, "a broad field of choice was extended to each and every examinee, so broad that a deep knowledge of classics or mathematics was not positively essential to success."

But was there not a prevalent opinion that the "broad" was also the shallow knowledge? Was not sciolism encouraged by the demand for breadth and the disregard of "depth"? Of course, people who believe exclusively in a classical education have already made up their minds against the arguments of Mr. Scoones. Give us accuracy of scholarship, they say, and we ask no more from men of twenty-one. Now under the old system acquirements very unlike accuracy of classical scholarship had their chance of success. Sanskrit, moral science, thorough English and French, with Fifth-form Latin, might secure an appointment. But under the new system you cannot ask for this wealth of learning. Aristotle himself, who ought to know, says that young men are unapt for moral science, and Plato compares lads engaged with moral science to puppies worrying some unfortunate object. Sanskrit, too, is a "link too many" for most boys, if we may adopt an idiom from Nicholas, the regretted author of a work on Knur and Spell. Again, Mr. Scoones says that "ripe English scholarship, good average soundness in modern languages, and a branch of natural science, added to Fifth-form Latin," would sometimes win a place. But these accomplishments are no longer of service. It comes to this, Mr. Scoones says, that it is practically impossible for any lad whose bent is not to classics or mathematics to enter the Indian Civil Service. And he adds, "Only Upper Sixth-form boys need apply." We still fail to see, granting Mr. Scoones's premisses, why private teachers should not turn out boys quite as strong in classics and mathematics as the schools can produce. If the present private teachers are not masters of the classics, a new order of men who are adepts will take their places. For there must always be boys whom a private teacher can induce to be industrious, but who are tempted away from work by the social and athletic pleasures of schools. Among these boys the private teacher who is able to teach the subjects required will inevitably find his pupils.

Things become much more serious when Mr. Scoones complains that, under the new system, "every particle of real culture was made to disappear." We had supposed that the attentive reading of Homer and Thucydides was in itself no small part of a liberal education. But Mr. Scoones says that Greek and Latin are no longer to be studied in a liberal spirit. They are to be "shorn of their history, their literature, and antiquities." If this indeed be so, not only is the new system bad, but it follows that classical teaching at the public schools must be bad in spirit. We had understood that classical antiquities were no longer neglected at the schools, that gems and coins were studied, that history went along with philology; but it seems we were mistaken. English history, too, and the history of English literature, are neglected. Out of twenty-seven successful candidates in last July, twelve did not "take up" English history, and twelve declined to be examined in English literature. We doubt whether a man of twenty-one can be, as Mr. Scoones thinks, "a ripe English scholar"; but certainly a boy of nineteen should be ashamed of ignorance of English history.

It is not easy to arrive at any definite opinion upon the whole question. We confess that we prefer public to private, and classical to "general," education. We are tolerably certain that no wrong is done to the private interests of crammers by the new system, but we are by no means so sure that the public interests of India have not suffered. As to the personal topic, we admire the letter of a Crammer published in the *Guardian* (Nov. 17). This excellent tutor, when a parent asks his advice, says, "Keep him at a public school as long as you can. Still, I keep on in this line (cramming), for a man must live." As to the public interests, the experience of a very few years will show us whether the native gentry are wise in agitating, as Mr. Scoones says they are doing, "against what must appear to them an unstatesmanlike monopoly." Was the practical monopoly previously secured by the exertions of one or two private teachers more "statesmanlike"?

THE QUICK MARCH OF MILITARY REFORM.

THE British officer has fallen upon evil times. In common with his civilian fellow-creatures, he suffers from excess of paternal legislation regarding his mental improvement. The authorities will not leave him alone, and the insatiable educational demands of modern military science sit heavy on his soul. It can hardly be a matter for surprise if, during his moments of leisure, supposing him ever to have any, he now and then casts a regretful glance backward at the life led by his professional ancestors as depicted by Charles Lever and the authors of his school. It appeared to be all play and no work in those days; plenty of hard fighting in time of war and hard drinking in time of peace being the component elements of military life. Nor is there any reason to suppose that the picture was much overdrawn, for it is in keeping alike with the social and the military life of the day. At the beginning of this century an officer who had once passed his recruit's drill had completed the educational curriculum then required, and everything else was left to chance. He might or might not study his drill-book, and master the mysteries of battalion drill. If he did, he was regarded with mingled feelings of surprise and contempt by his comrades; if he did not, it did not much matter. The stock-in-trade with which he entered upon the arduous duties of active service consisted principally in a sublime ignorance of tactics in particular and of the art of war in general, and a firm trust in Providence that everything would go right when the time came. When his turn for promotion arrived no questions as to his fitness were asked, for the simple reason that there was no one able to ask them. He might not know more than his predecessor; but, on the other hand, he certainly could not know less; and thus a certain standard of proficiency, though perhaps not a very exalted one, was maintained. Such a system naturally acted as a dead weight upon brains and talents, these commodities being at a discount, while money and interest came to the front. The service was full of purchase, nepotism, favouritism, and all uncleanness; in fact, it is evident altogether that, judged by the enlightened standard of the present day, the British officer of the past was but a sorry creature; and it is also clear that no troops led by such men had any business to win victories. Yet, strange to say, they were always winning victories. The long roll of names borne on the standards of our various regiments records a series of victories and triumphs won over the best troops of Europe and the most warlike tribes of Asia. A well-known officer of the first French Empire, Marshal Bugeaud, declared his opinion that the English infantry was the finest in the world. Another General Foy, advised his countrymen never to attack them unless success was certain. The discipline of the British army has repeatedly excited the admiration of foreign critics. There yet remains another important fact to notice—namely, that, while in most other countries the army has seldom failed at some period or other to be a source of political embarrassment, our army has never caused us a moment's uneasiness on that score. We have had such things as naval mutinies, as witness Spithead and the Nore; but we have never had a military mutiny.

Now it is idle to maintain that such an army can have been badly officered. As a matter of fact, it was remarkably well officered; for the officers were exactly suited to the times in which they lived and to the men whom they commanded. It is to be observed that at the period we are speaking of—namely, the commencement of the present century—war had not attained to the dignity of a science. Here and there an officer who had risen rapidly through the lower grades might study tactics and strategy; but for the great mass who could never hope to rise high in their profession there was nothing to learn beyond the formal and cumbersome drill of the day. The weapons in use were primitive, and required no special training. Rifle drill, signalling, field-work instruction, topography, and the numerous other studies which are now considered necessary were not yet invented. The British officer of the day had nothing to do in time of peace, and he did it thoroughly and conscientiously. Nor was this of much moment when the nature of the warfare of those days is considered. Military operations were conducted with an amount of concentration which seldom allowed a subordinate to distinguish himself on detached service, and with a slowness and formality which gave ample time for deliberation in any moment of emergency or danger. A single example will suffice. Most readers of Napier's *Peninsula War* will remember his vivid description of how, in the operations preceding the battle of Salamanca, two hostile columns marched towards a common goal for upwards of ten miles within half musket-shot distance, the officers on either side saluting each other with their swords. But, as already stated, there was one thing which the British officer of the past did, and did well—he preserved most excellent discipline, and he maintained his authority and influence over his men unimpaired under circumstances which have almost invariably proved fatal to the discipline of foreign armies. We have seen it remarked by a foreign critic that the proudest boast of our troops ought to be that they have never been routed—that they have never exhibited such spectacles as those presented by the French at Rossbach and Vittoria, or by the Prussians at Jena. The bloody defeat of Fontenoy saw the British leave the field with unbroken ranks; the disastrous retreat to Corunna concluded with the orderly embarkation of every man who could reach the shore; the terrible day of Albuhera showed how they could, by sheer steadiness and discipline, convert downright defeat into decisive victory; while, to come down to more modern times, the account of their behaviour at the wreck of the *Birkenhead* was ordered to be read to every regiment in the Prussian army. On the principle that the tree should be judged by its fruits, the British officer of those days was, we repeat, in spite of his lack of learning, a good, and what is more, a successful, public servant.

So much for him in the past. Before we consider him in the present we must glance for a moment at the new conditions of his profession. Every one is aware of the changes that have taken place in modern war. We have improved our weapons to such an extent as to inspire a wholesome fear of their effects, and whereas the soldier of the past had but one object in action, namely, to kill his enemy, the soldier of the present has two—to kill his enemy and to preserve himself. Possibly we may some day arrive at a state of things which will involve the inversion of the order in which we have put them, but we must not anticipate. In the meantime this new order of things has necessitated a considerable amount of study, the object of which is to make even the most subordinate officers familiar with the nature of the weapons wielded by their men, the formations and tactics best calculated to give those weapons their proper effect, and the best means for providing cover from the enemy's fire. Moreover, operations are nowadays conducted with a rapidity which allows no time for deliberation, and thus any officer may find himself compromised in a moment of emergency from want of knowledge. Accordingly, we have been compelled, in order to keep up with the times,

to institute a regular system of military education. At first it was confined exclusively to those who had not yet obtained commissions, an entrance examination only being demanded, and later examinations in drill and interior army economy were ordered before each step in rank was attained. Here there was a pause for some years, and then the educational or extra-professional subjects began to make their appearance. First came the musketry drill, which included the theory of the flight of projectiles, the effects of rifling the barrels of small arms, and the manufacture of gunpowder; next came elementary fortification, military law, military topography, minor tactics, including the principles of employment of all three arms and the projectiles in use by artillery, military signalling, &c. At first the greater part of these were demanded only in the early stages of an officer's career, and even then on a moderate scale; but of late the educational pace has become more severe, and a recent Horse Guards' Order has created something approaching to consternation among captains in the army. It introduces a new system which is to come into force on the 1st of January next, and its leading feature is that successive examinations of increasing severity have to be passed to qualify for each rank up to that of major, when all further examination ceases. The subjects are divided into four headings, namely—(*a*) Regimental Duties, (*b*) Drill, (*c*) Military Law, and (*d*) Duties in the Field. The two former are merely what have previously been demanded, though perhaps the new test is somewhat more searching. Section *c* involves a knowledge of the history of military law, of the Army Discipline Act, of the procedure of courts-martial, and of practice in framing charges. Section *d* is by far the most formidable, embracing as it does topography and fortification. In the former we have the construction and use of the prismatic compass and the necessary drawing implements, triangulation, traversing, contouring, eye-sketching, and road reconnaisance and reports. In addition to the above, captains are required to undertake the reconnaisance and occupation of a military position. The course of fortification includes the construction and use of scales, construction of parapets, penetrative powers of artillery, nature of field-guns now in use and their projectiles, hasty entrenchments, field-works, obstacles, revetments, working parties, various kinds of field-works with their advantages and defects, defence and attack of houses, demolition of bridges, barricades, railways, &c., knotting and lashing spars and construction of spar bridges, passage of rivers and fords. In addition to these, captains must also have a knowledge of the principles to be observed in attacking and defending villages, woods, and positions. At present there is one reassuring circumstance, and that is that only half-marks are required to pass in each subject; but before long the standard will probably be raised. An examination in riding is also now made compulsory—and most properly so—before the rank of major is attained. We remark, too, that no exemption from examination is now allowed, as was formerly the case, to officers who have proved their fitness in the field. It is distinctly stated that no officer either at home or abroad will be promoted when his turn arrives unless he has fulfilled the required conditions. No doubt all this is right and necessary, but we fear that there are numbers of old captains still serving upon whom these demands will press hardly, men who entered the service under very different conditions, and who, though they may not possess a high educational status, are not the less good officers. There are other serious questions also connected with this development of military education, but these we must reserve for a future occasion.

A GUEST BOOK.

THE passion for writing oneself down may be proved by excellent authorities to have always existed, but opportunities for its gratification have never been so fully provided as in these latter days. First there were the confidences of Confession Books, which, adopting the idea of an old children's game, enabled young ladies in their salad days to extract from their unhappy friends compromising avowals as to their tastes in literature, history, food, and many other things. Then followed an avalanche of Birthday Books, which indeed cannot be said to have yet ceased to fall. Every author of importance has now been laid under contribution, for mottoes, and birthday books are getting not a little stale. So some intelligent person has hit upon the idea of a Guest Book, which lies before us at this moment; and a well-known firm of publishers, celebrated for Christmas cards and such like things, has got it up in oblong album shape on paper of the colour of iced gooseberry fool, with blue lines and letterpress. Like all great ideas the notion is a simple conversion of an old and familiar thing, the "Visitors Book," familiar to the traveller as perhaps the most fertile field for the discovery and exploration of the folly and vulgarity of British mankind. The arrangement is methodical enough. There is a quotation at the head of each page, and a quotation at the beginning of each line. On this line the guest is supposed to inscribe his name, his address, the dates of his arrival and departure, and the place of his destination, while a space is allowed him for "events, adventures, and remarks." The latter might be found a little cramping by the scribblers who cover whole pages of inn-albums with comic verse or gushing prose, for it does not much exceed an inch in height, and seven or eight in width. But a good deal may be done in it with a crowquill. Very possibly the thing may be itself intended for an inn-album, but it rather suggests itself as appealing to private hosts, and to guests who do not pay for their entertainment in coin of the realm.

This being the case, the section of "events, adventures, and remarks" seems a little awkward. Matter-of-fact persons ought not to be much puzzled by the "events," and a faithful record might be instructive to after-comers, by showing them what they have to expect. There are few houses so abundantly provided with distractions that the course of A.'s experiences will not in some way forecast B.'s, and the thoughtful person anxious to lay out his time to the best advantage might be grateful for the record. "Adventures" suggests more difficulties, but "remarks" is the *crux*. What sort of remarks is an unfortunate guest taking leave of his host expected to put down in that host's Guest Book? Is he to be guided by veracity or politeness? And, if by the latter, how far may his politeness go without introducing a dangerous confusion between the house and the hotel? For instance, would it be safe to imitate The Mulligan, and remark that the champagne is good at this house? If this be allowed, we are obviously on an inclined plane; and the distance is not so very great to "very comfortable house, great civility and attention from the worthy host and hostess"—which is not to be thought of. Uncomplimentary remarks are obviously impossible, and yet successive eulogies might be suspicious. The poetical vein which seizes persons who take their ease in their inn could hardly be indulged; and altogether it seems probable that, whenever the Guest Book is brought into actual use, the section of "events, adventures, and remarks" might as well be covered with black ink, like an English newspaper when it is delivered to the reader in Russia. Without this, however, it sinks to the level of a mere register of names and dates, such as used to be kept at most London hall-doors before the invention of visiting cards; and its positive service would not go much further than to make it tolerably certain that the visitor's letters would be sent on to the right place. The compiler, therefore, seems to have done either too much or too little. Instead of his dangerous and ambiguous heading of "events, adventures, and remarks," he should have appended a string of definite questions for the departing guest to answer to the best of his judgment—such as "What is the best wine in the cellar of this house?" "Is it safe to come down very late to breakfast?" and so forth. Such inquiries would be a little *intimes*, but they might be so put and so answered as to be full of instruction to the newcomer, and to avoid any danger of hurting the susceptibilities of the hosts. In strictness, to be sure, this part of the book ought to be in the charge of a confidential servant, who should show it to no one but a *bonâ fide* arriving or departing guest. But there might be difficulties about this. Indeed it is not particularly easy to imagine any arrangement of the Guest Book which should provide for "remarks," and which at the same time should not be exposed to difficulties.

The mottoes, or, as he himself calls them, the "appropriate quotations," of the Guest Book are apparently the feature of it on which the author most prides himself. The worst of them is that there seems to be a certain happy-go-luckiness about them, and that it is by no means sure that they would always go lucky. For instance, a whole departure page is headed, "I have not seen this year such company at once within this house as is here now," which, if complimentary to the present, is a little unkind to the absent. A man, too, who pays his first visit, and is shy, might not be best pleased to find the epigraph "Old friends are best" staring him in the face as he signs his unfamiliar name. A martyr to the gout with a snappish temper—as such martyrs frequently have—might be somewhat insulted at being requested to "Come and trip it as you go on the light fantastic toe." "Small cheer and great welcome make a merry feast," suggests Pecksniffian possibilities. Nor, though the author—or, rather, the compiler—has in some cases ventured thus on perilous ground, has he been able to fill his book. After some scores of pages the mottoes begin again and revolve in the same cycle, which seems to show either a certain poverty in English literature, or a certain indolence in the selector. It is fair, however, to remember that when he has headed his pages his labour is by no means over. He has then to devise side mottoes, one of which, as has been said, accompanies every line. Here, however, like the compilers of the birthday books already mentioned, he has given himself a really charming latitude of selection. What, in the name of the Sphinx, is an unhappy, and possibly nervous, person, to make of the statement, "I must be cruel only to be kind," against which he or she is solicited to write his or her name? It suggests the most awful possibilities, and the heroine of *Northanger Abbey* would have nearly fainted at the announcement. "A friend of solitude" may mean that the guest is to be left a good deal to himself, and this, though acceptable to some people, would be very much the reverse to others. "To me, fair friend, you never can be old," suggests a painful inference as to the probable opinion of the world in general. "I have important business, the tide whereof is now," seems rather appropriate to the holder of a little bill than to a guest. "Dearest friends, alas, must part," addressed to a guest on his arrival, is of dubious hospitality. "Farewell, Othello's occupation's gone," suggests that the compiler thought that anything that had farewell in it would do. In short, we do very much suspect that mottoes already selected for a Birthday Book or some other similar work have been re-arranged pell-mell by the sides of these pages, the effect being occasionally describable by no other word than idiotic. What in the world, for instance, can be the fitness of "Sigh no more, ladies, sigh no more," in such a place as this? Re-

petition prevails here, as in the headlines, and it might be a little mortifying to somebody who had been pleased to find himself described in the flattering terms "You flavour everything; you are the *vanille* of society," to turn over the pages and discover the same text standing by the side of the name of the greatest bore of his acquaintance.

We do not suppose that the mania for mottoes will stop at Guest Books, nor is there any reason why it should. Doubtless, we shall soon have motto Cellar Books, motto Washing Books, and so forth, all "the books of the establishment," in short, with which Frank Fairlegh made his acquaintance, but adapted to cultivated tastes and nicely illuminated. Both the volumes we have suggested have great capacities for intelligent selection of quotations. The Washing Book might be made into a treatise *de re vestiaria*, almost after the heart of the Baron of Bradwardine; and the testimony of the Cellar Book to classic views of fermented liquor would make Dr. Richardson shake his head more than ever over the secular perversity of mankind. The various publications by which Messrs. Letts and other enterprising printers endeavour to lessen the toil of house-keeping all admit of similar treatment. The Rental Book, especially at the present time, suggests a neat *encadrement* of selections from the oratorical works of Messrs. Parnell, Dillon, Redpath, and other guides and friends of landlords. The Game Book might be edited by Mr. Peter Taylor from one point of view, by Mr. Chaplin from another, and by an enthusiastic naturalist from a third. Only we would suggest that in any future extension of the system the mottoes should be more liberal in number and somewhat more appropriate to the subject than is the case in the volume before us. We cannot undertake to say who was responsible in the first place for the bright idea of taking scraps from the classics and applying them anyhow to base uses of this kind; but the notion certainly seems to have "taken." To a reasonable being one would have thought that the whole charm of such a thing, if it had any charm at all, would be in the fact of its being home-made, as, to do it justice, the original album, the fount of all these plagues, was at least supposed to be. It is sufficiently absurd that a thousand Smiths or Browns should be proudly appropriating the same printed description of their character and virtues in a Birthday Book, or writing themselves down "a scholar, and a ripe and good one," or "Of high-wrought vein, fastidious" in this present Guest Book. Perhaps the machine-made air of the proceeding is not unbefitting an age of machinery. After all, the Guest Book may possibly amuse somebody in an inn parlour, which seems its natural home, and in that case the exiguity of its space for remarks will be rather a blessing than otherwise. Perhaps we should mention, in respect to its ornamentation, that, while it has duly got *Salve* and *Vale* on it, it has not got a dog, nor have we discovered any trace of *Cave canem*. The absence of these favourite embellishments is somewhat surprising. However, there are some rather pleasing swallows on the cover, which, if not so learned as the dog, are perhaps more appropriate.

THE COST OF LITIGATION.

A LETTER has lately been published, addressed by Mr. Chalmers, a barrister, to Baron Pollock, on the subject of "The Cost of Litigation." When we say that Mr. Chalmers regrets the excessive cost of legal proceedings nowadays, and strives to point out a method by which it may be reduced and minimized, the irreverent and flippant may be tempted to scoff at his laudable endeavour, and to suggest that the idea of a barrister seeking to reduce the cost of law is analogous to that of an alderman deprecating the consumption of turtle, or a thief petitioning for an increase of the police force. To such, however, Mr. Chalmers's effort may be justified on the low ground of worldly wisdom, in that he points out that there is such a thing as killing the goose that lays the golden eggs, and that law probably follows the same rules of supply and demand as other commodities. If it is good and cheap, the demand for it will rise in a corresponding ratio. We ourselves attribute to Mr. Chalmers a higher and more legitimate motive; but unquestionably Bar work has been very slack for some time past. Delay and expense combined, both of which evils seem to be on the increase, have frightened men from litigation; and there appears considerable danger of people adopting the Apostolic advice of suffering their wrongs quietly, and not going to law one with another, at any rate to the same extent that they used to do. Such a state of affairs, however, is scarcely suited to modern times, and rogues would flourish marvellously if by necessity or common accord their victims refrained from appealing to the arm of the law for protection or redress. So that it behoves lawyers, for the sake of the public no less than their own, to look around and see how they may render the Temple of Justice more accessible.

It is a sad and humiliating thing when any system introduced with a great flourish of trumpets is found wanting, when the goodly fruit crumbles like Dead Sea apples; but it is far worse to go on living in a fool's paradise, to congratulate ourselves on our system being the best possible system when in reality it is full of faults and aggravates the very evils it was designed to obviate. Seven years ago the first Judicature Act was passed, which was to introduce a new and matchless system of legal procedure; it was to redeem—tardily perhaps, but completely—the promise given at Runnymede, that "justice shall not be denied or delayed to any man," by bringing good and cheap law to every man's door. Inveigled by this flattering tale, litigants for a while flocked to the Law Courts, only to find things pretty much as they were before. But litigants are as slow as sheep to take example and warning by the fate of their precursors; and the disappointed ones were quieted by being told that the new system wanted a little time to get into working order, while those who were trembling on the brink were encouraged to take the fatal plunge by being assured that by the time their turn came everything would infallibly be in full working trim; and so the game was kept up. But now seven years have rolled by—time enough, in all conscience, for anything which was ever going to work at all to be working—with the result that there were at the beginning of the present sittings some eight hundred causes waiting for trial in Middlesex alone; which ghastly list is diminishing under the efforts of the few available judges, only because the disgusted would-be suitors do not care to pile Pelion on Ossa and begin actions to be set down possibly among the thousands; or else because some of those whose names already figure on this portentous roll, tired of waiting, have resorted, contrary to their original intention, to the expensive tribunal of the arbitrator. The number of R's and W's, denoting that a cause is referred or withdrawn respectively, now to be seen on the Middlesex list at Westminster, is a sorry sight for those who still believe in the efficacy of the Judicature Acts. Meanwhile, solicitors are engaged in making out bills for old work done instead of doing new, and barristers, returning fresh and keen for work after the Long Vacation, are compelled to eat out their hearts in chambers or loaf about Westminster with nothing to do, by reason of what is now too well known as a block in the Courts.

And is it really the lauded Judicature Acts that have brought us to this? Mr. Chalmers says it is, and he is in a position to judge. He was in the confidence of Mr. Arthur Wilson, draftsman of the original rules which constitute the working basis of the new procedure, and author of the standard work on existing practice. When Mr. Wilson was translated to a judgeship in India he bequeathed his mantle to Mr. Chalmers, who is bringing out a new edition of the aforesaid book of practice; and it is in the course of the study involved in this task that Mr. Chalmers has become convinced that the present state of affairs is attributable, in part at least, to defects in our code of procedure.

Having satisfied himself that the present system is far from perfect, Mr. Chalmers casts about for a remedy. It is obvious, as he points out, that "the deliberate policy of the Judicature Acts cannot be reversed, and that any return to the old state of things is impossible." The disturbance and confusion of a second revolution in judicial procedure occurring within a decade would be appalling, and is not to be thought of for a moment. "Any reforms in procedure must," as Mr. Chalmers justly observes, "be by way of amendment in the existing system." Before considering what appear to him the principal faults of that system, Mr. Chalmers remarks that "the cost of litigation is made up of two constituent elements, the expenditure of money out of pocket and the expenditure of time." It would, however, be bad economy to sacrifice efficiency for either expedition or mere cheapness, and therefore the two tests to which not only a system of procedure, but each individual rule of it, must in the interest of litigants be subjected are—"First, does it tend to elicit the whole of the relevant facts in a convenient form for the application of the law thereto? Second, does it seek to attain this end in the quickest possible manner, and with the least possible expenditure of time and money?" But to attain these ends a system of procedure need be very elastic. The causes which come before the Courts present every imaginable degree of complexity. Where the issues are simple, a simple method of presenting them for decision should be adopted; where the issues are multiform and involved, a more elaborate preliminary procedure may well be justified as tending to ultimate simplification and true economy. That the first of these principles was recognized by the framers of the Judicature Acts and their auxiliary rules is beyond question. With a view to meeting the very simplest cases, they did not deem it derogatory to the dignity of the High Court of Justice to undertake the lowly office of a debt collector. By the invaluable process technically known as Order 14, a plaintiff for debt may at the very earliest stage of his action call upon his adversary to show cause why he should not at once pay the sum claimed from him. If the case be a simple and plain one, the plaintiff recovers without further delay, and it is difficult to conceive a more speedy and salutary remedy, considering the number of actions which were formerly defended for the mere purpose of gaining time or bringing about a compromise. But it is only in the most transparent cases that this procedure is applicable. Judges will not try a case on an application of this sort, and the unsupported oath of the defendant that he does not owe the money, or his offer to bring it into Court, is in general sufficient to remit the plaintiff to the ordinary course of his action. Here, then, is the first of the defects Mr. Chalmers attributes to the Judicature Act system. It is, he says, a grave mistake to have no intermediate method of procedure between the bare simplicity of such debt-collecting as the above, and the elaborate, expensive, and tedious ordeal of a regular trial, with all its preliminary business of pleadings, interrogatories, discovery, &c. There are a large number of cases which are perhaps not quite simple and plain enough to be disposed of summarily amid the noise and bustle of Judges' Chambers by means of Order

14; but to apply to which the whole machinery necessarily framed and designed for the unravelling of the most complicated and multiform series of facts is as absurd and wasteful as using an hydraulic press to break a butterfly. Some intermediate process is manifestly desirable. What it should be we cannot undertake to say here, nor does Mr. Chalmers enlighten us; he only vaguely refers to "Chapter XII. of the Indian Civil Procedure Code."

The next object of Mr. Chalmers's animadversion is no less than that palladium of our liberties, the British Jury, which he states to be "by far the most expensive mode of trial that can be selected." The items of expense particularly chargeable against trial by jury are: (1) The necessity of more evidence, because of the impossibility of supplementing any oversight later on. (2) The greater uncertainty as to when the trial will come on, whereby witnesses are kept in attendance longer than they otherwise would be. (3) The necessity, or at least opportunity, for longer speeches by counsel, and a summing-up by the judge, whereby the trial is protracted. (4) The almost invariable application for a new trial, on some ground connected with the finding of the jury. All this, as Mr. Chalmers says, "unavoidably gives an advantage to the litigant with the longest purse," and he suggests two amendments. The first carries a well-known provision of the existing system a little further, and provides that "when both parties consent to a trial by jury no new trial shall be granted on the ground that the verdict was against the weight of evidence, and that where one party insists on his right to a jury against the wish of the other, the verdict shall be conclusive as regards the party so insisting." This really appears a most sensible suggestion. It is merely putting the finding of a jury on the same footing as the finding of an arbitrator, and there seems no logical reason why the decision of one man selected by the parties should be more conclusive than the decision of twelve men selected for them by the law. Moreover, as Mr. Chalmers points out, juries are now relieved from a large portion of their responsibility by knowing that if the presiding judge disagrees with their verdict, there will in all probability be a new trial; and with this pleasing assurance that justice will probably ultimately be done in any case, they are apt to disregard the extra expense which a careless or unconsidered verdict is likely to entail upon the parties; whereas, if they knew their verdict would be final, they would in all probability bestow more care and thought upon it. The lightening the work of Divisional Courts, and the consequent liberation of more judges to try causes at Nisi Prius, would not be least of the advantages to be expected from such a scheme. Mr. Chalmers even goes so far as to suggest that "except in certain specified cases, trial by jury should only be allowed after leave obtained from a judge, and that the decision of the judge on the point should be final"—thus making trial by jury the exception instead of the rule. This appears an alarming innovation, but, as Mr. Chalmers says, a good many cases have latterly been tried very satisfactorily by a judge alone which would formerly have been tried with a jury. Unsuccessful litigants are more wont to attribute partiality to a jury than to a judge; and a large number of cases which now come for trial before a jury have sooner or later in the course of the trial to be referred, to the no small disgust and expense of the parties. If, as appears demonstrable, trial by jury is in a large majority of cases an inappropriate and extravagant method of adjudication, it is certainly advisable to bring a little pressure to bear in order to wean people from that to which they would, more from force of habit than from any deliberate or intelligent choice, be prone to resort. The class of actions which Mr. Chalmers would always retain for the consideration of a jury are actions involving questions of fraud or personal character, actions involving complicated questions of mercantile usage, tried in a place where a good special jury can be got, and actions against Railway Companies for personal injuries. The retention of the latter class of actions he justifies on the ground of public policy, the exemplary damages usually given by juries in accident cases acting as a salutary incentive to caution and vigilance on the part of Companies.

The abolition of formal pleadings in favour of a simple statement of the issues of fact in simple cases is also recommended by Mr. Chalmers, and, as in the case of jury trials, he points out that a little gentle compulsion would probably be necessary to induce people to quit the beaten tracks of procedure for those which might be selected as more conducive to their welfare. Such at least was the experience derived from an optional provision of this sort which existed in the Common Law Procedure Act of 1852, but which, probably because nobody availed himself of it, was not reproduced in the Judicature Acts.

The number of appeals from an order of a Master sitting at Common Law Chambers which is open to a persistent litigant naturally calls for some remark. The Master is practically sitting as Judge, yet an appeal lies from him to the Judge, from the Judge to the Divisional Court, from the Divisional Court to the Court of Appeal, and thence to the House of Lords; and all this about a matter which may not ultimately materially affect the final decision of the cause. The Chancery practice is far more rational—an appeal from the Judge in Chambers usually going straight to the Court of Appeal, no such thing as a Divisional Court being known; and an assimilation of the two systems would be a ready and natural method of diminishing the cost and delay incident to the Common Law procedure; an almost endless chain of appeals tending, moreover, to induce that sense of comparative irresponsibility in judges and counsel which the ever-present potentiality of a new trial inspires in juries.

The constitution of Divisional Courts is also open to criticism. The judges of the Chancery Division are not *ex hypothesi* wiser than their Common Law brethren, and yet a single Chancery judge daily disposes of matters no less important or momentous than those which require the united energies of two, or sometimes three, Common Law judges. To adopt one of Mr. Chalmers's illustrations, County Court judges have unlimited jurisdiction in bankruptcy, yet a bankruptcy appeal from a County Court lies to a single Chancery judge, while the most trumpery appeal from the limited Common Law jurisdiction of the same County Court can only be dealt with by two Common Law judges sitting as a Divisional Court. An amending Judicature Act of 1876 was certainly a step in the right direction, enacting as it did that all matters should as far as possible be settled by one judge, and that, save in exceptional cases, a Divisional Court should be constituted of two, not three, judges; but the first clause of this provision has hitherto only resulted in a scanty number of "further considerations;" and it is by no means an uncommon sight at Westminster to see three judges sitting in banc, hearing cases obviously not within the far too large class directed so to be heard. Mr. Chalmers would relegate matters now heard by Divisional Courts, with but two justifiable exceptions, to a single judge sitting in open Court, thus assimilating the practice of the Divisions, and effecting a large saving of judicial power.

The next suggested amendment is that the Long Vacation should be curtailed, or, if that be found impracticable, that it should begin and end earlier, in order to fit in more with the ordinary holiday time of business men and secure the greatest amount of efficiency; the heat of a crowded court in August rendering, as Mr. Chalmers says, a day's work then inferior in quantity and quality to a day's work in October. We will not dwell here on the anachronism of a total cessation of business for more than three months at a time in this hard-working age, or on the hardship thereby inflicted alike on suitors and those members of the legal profession whose work cannot necessitate, and whose means can hardly stand, so protracted a period of idleness. The Long Vacation in its inordinate immensity is, we fondly hope, doomed; it certainly is so unless concessions are made by its upholders, and the least of such concessions is that suggested by Mr. Chalmers.

Passing over a suggestion as to the functions of the Council of Judges, which body Mr. Chalmers believes has never met since its institution, we come to a very serious blot in the existing system. The Judicature Acts expressly preserved all pre-existing procedure, save so far as it might be inconsistent with the new, and they expressly repealed nothing. The extent of the confusion thus introduced may be judged from the fact recorded by Mr. Chalmers, that when in 1877 Mr. Arthur Wilson was commissioned to draw up a list of the unrepealed statutes relating to procedure, that list contained no less than 479 Acts, to say nothing of 231 Rules of Court under the Common Law Procedure Acts and 42 Consolidated Orders of the Court of Chancery. A repealing Act passed in 1879 got rid of 104 of the above-mentioned statutes, but affected none passed since 1851; so that more than 300 Acts, together with a mass of rules and orders, still remain to complicate matters and hinder the rapidity and efficiency of the course of litigation; for, inasmuch as the Judicature Acts fail to cover the whole ground, many important remedies have still to be sought by means of the old procedure. Mr. Chalmers suggests the obvious remedy—namely, that all these statutes, rules, and orders should be swept clean away, and that such of their provisions as it appears desirable to retain should be incorporated into the Judicature Acts and rules, thus rendering these the sole repository of a self-contained and complete code of procedure.

Such is the substance of Mr. Chalmers's charge against the Judicature Acts and the system introduced by them. As will have been seen, he does not in every case attribute the enhanced cost and delay of litigation directly to the inherent vices of the new procedure. Its faults are as much those of omission as of commission. Its framers had an opportunity of really reforming all existing abuses; they allowed many of these to continue, and added a few more. But people grow wiser by experience, and though tinkering legislation is usually to be deprecated, it might be well to try the effect of the adoption of some, if not all, of Mr. Chalmers's suggestions.

GUSTAVE PLANCHE ON KEAN AND MACREADY.

IN 1835 there appeared in Paris an illustrated magazine called *Le Monde Dramatique*, which had enough success to leave its mark behind it in the shape of three well but closely printed volumes, averaging considerably over four hundred pages each. Whether it reached beyond the third volume, which is dated 1836, the first two belonging to 1835, we have never been able to find out; but the three volumes as they stand are a mine of information and criticism on the theatre of the time, which, it need hardly be said, was one of the most important in the history of the modern drama. Among the contributors were the great Dumas, Théophile Gautier, Alfred de Musset, Frédéric Soulié, Alphonse Karr, Macquet, Bouchardy, Léon Gozlan, Albéric Second, Gustave Planche, and Hector Berlioz; among the illustrators were Gavarni, Devéria, and Célestin Nanteuil. It is, however, only in the first two volumes, and especially in the first, that such distinguished names as these are to be found; and it seems not unlikely, therefore, that the interest or popularity, or both, of the

work declined by degrees, and that it practically, if not actually, disappeared in the second year of its life. Its criticisms include the German, English, Russian, Italian, Spanish, and Chinese stages, and deal with theatrical performances of every kind, from the Français to the Cirque Franconi; its illustrations and its portraits of singers and actors of the time are full of merit and interest. Besides theatrical and musical criticism, the volumes contain a great deal of fine confused reading—wild stories by Bouchardy, artistic essays of many kinds, and amongst other curious matter a biography of the real Mlle. Maupin, which shows how much material Gautier found ready to his hand, and what a skilful use he made of it, and to which, on the words, "sa vie toute bizarre, pleine d'incidens curieux, pourrait fournir la matière d'un roman plein d'intérêt," there is a foot-note:—"Un de nos collaborateurs, M. Théophile Gautier, s'occupe en effet depuis longtemps d'un roman qui porte pour titre; *Mlle. Maupin.*" The volumes are, as we have already said, full of interest for all who care about dramatic affairs, and we may have more to say of them on a future occasion. For the present it may be not uninteresting, especially in this time of Shakspearian revivals, to see what Gustave Planche had to say of the "Théâtre Anglais" in 1835. M. Planche began his essay by some remarks on the close connexion which, as he thought, always existed between the state of poetry and the state of the stage. Great poets may sometimes be interpreted by mediocre actors, and great actors may find no contemporary work worthy of their powers; but "il faut reconnaître que les grands poètes et les grands acteurs se tiennent ordinairement par la main. Pour les grandes pensées il se trouve d'éclatans interprètes; et même il n'est pas rare que le spectacle d'une pantomime admirable renouvelle et inspire des esprits qui jusque-là demeuraient engourdis." Instances of the truth of this last assertion might easily be multiplied, and readers of Macready's Reminiscences will remember a striking one which is to be found in them. "What I have just said," continues the writer, "gives the key to the present state of the stage in England. There is a want of great writers, and a consequent want of great actors." He goes on to say that since Kean's death there has been no tragedian worthy of Shakspeare. Between Shakspeare and Kean there was a complete sympathy; "chez le poète et le comédien c'était la même inspiration, la même soudaineté de génie." Shakspeare's method as a writer was matched by Kean's as an actor. Shakspeare did not, as many "docteurs ignorans" believe and assert, allow himself to be carried away by the impetus of his thought; on the contrary, "il intervient par sa volonté et même par sa patience dans les moindres parties de son œuvre. Mais il aime particulièrement les traits imprévus par lesquels se révèle le caractère d'un personnage." He had the resources of the stage completely at command, and he took his own way with a deliberate purpose. To that way Kean's way was admirably fitted. The actor could give to his interpretation the same air of spontaneity, the result of patient labour, which the poet gave to his writing. Not, says M. Planche, that I deny the inspiration which often impelled this great actor. But I know that he never trusted to inspiration as it might come on the boards at night for the interpretation of a character. He had a higher idea of his art. He did not wait till he was before the public to find the means of moving them. He came on the stage conscious of a power already tried, knowing what gestures, what intonations, he meant to use. But, like the great orators, while he commanded the crowd, he himself obeyed a higher power, and sometimes, in his complete identification of himself with the character he represented, his familiar demon gave him some new light. However, "la spontanéité apparente de ses mouvemens n'allait jamais à l'entier abandon." Kean, M. Planche ended by saying, carried his secret away with him; no one who followed him recalled his genius.

Macready, he continued, was certainly the best of Kean's successors; but how wide was the interval between them! Macready should play tragedy rather than drama. "Il est trop dédaigneux et trop sévère pour se plier aux détails de la réalité. Amoureux avant tout de la beauté linéaire, Macready représenterait dignement les héros de Sophocle." He excelled in giving by his gestures and attitudes a meaning to words which otherwise might fall flat. He has the statuesque beauty and repose which belong to the Greek drama; he has majesty and simplicity, but he wants vivacity and impulse—"on dirait qu'il a peur de troubler sa beauté par un mouvement indiscret." In short, Sophocles, Corneille, and Racine he can play admirably; Shakspeare he cannot play. It is not surprising to M. Planche that Macready has a special liking for Sheridan Knowles's plays. Since he cannot appear in Greek or French tragedy, it is natural that he should turn to those pieces which, without resembling the classical type, are yet furthest removed from Shakspeare. In works of this kind, which have in themselves mighty little value, Macready finds a free scope. He takes the play as a painter might take a blank canvas. There is nothing to prevent his indulging his love for simple and harmonious lines. As the sentiments he has to utter are of little importance, and the action is generally subordinated to the scenic effect, Macready assumes a tragedy of Sheridan Knowles's as he might assume a large flowing cloak, in which he drapes himself, loosening and tightening it round his shoulders at will. His liking for Sheridan Knowles, far from being a tribute to the playwright, is merely a proof of the actor's shrewdness. He does not devote himself to interpreting the poet; he makes use of him as a man makes use of a well-trained hack. Macready, M. Planche ends by saying, is about, it is said, to leave the stage, and become a clergyman. It would not be surprising if in this new career he obtains more fame and popularity than in his former one. "Car la prédication n'a pas les mêmes exigences que la scène; l'évangile est plus simple que Shakspeare."

All this reads oddly enough nowadays, and seems to show that Gustave Planche, having seen Macready only in Sheridan Knowles's plays, founded upon his performances the curious theories which he put forward. There may, no doubt, have been truth in some parts of his judgment; but, if it was entirely true, one can only suppose that he knew better than all the English critics whose opinions have been recorded.

Charles Kemble (M. Planche seems not to have seen the great John) brings to the parts which he plays close study and remarkable insight. But he was not any better fitted to play Shakspeare than was Macready, with his sculptural grace. He paid too much attention to the "caractère prosodique et musical d'Hamlet et de Roméo." And although, no doubt, there is grace and melody in many of Shakspeare's pages, yet M. Planche was sure that metrical beauties were the last things he considered; "ses devoirs de comédien et de directeur ne lui permettaient pas de travailler comme un poète de cour." There is a cheerful assurance about this statement which belonged naturally enough to one of the clique who had determined to "enfoncer les anciens." It would have hardly done for a devout Romanticist to admit that Shakspeare's verse was beautiful except by chance, and in "plusieurs pages." However, the effect upon M. Planche of Charles Kemble's style was that he missed all the meaning of the part. In Hamlet, for example, in "*To be or not to be*," il multiplie les pauses presque à chaque vers. On dirait qu' il craint de laisser dans l'ombre une beauté de style. Son débit ressemble volontiers à une leçon de déclamation." He seems to be reading Shakspeare to a class of young students, and pointing out to them the rhetorical beauties of the great poet. One expects to hear him diverge into comments on the text. The lecturer is thoroughly up in his work; but the author disappears. On the methodic and monotonous method which Planche attributed, justly or not, to Charles Kemble in tragic poetry, he has some good remarks to make. In ordinary life, he wrote, the uniform carrying out of one purpose may be, to some placid and unemotional natures, true happiness; but it will not do upon the stage. The perpetual repetition of the same gestures and intonation will end by giving coldness to the most perfectly conceived part. No one should be recommended to trust to the impulse of the moment; that is a senseless attempt; a mere caprice of vanity. But in every part memory and invention should have each a distinct place. "Que la trame générale du rôle soit déterminée d'avance, mais qu'il soit permis à l'acteur d'inventer pour quelques mailles de ce tissu des figures nouvelles; qu'il puisse, sans être accusé d'aventure, exercer à la fois sa mémoire et son imagination. Charles Kemble ne partage pas notre avis. Mais le public se range de notre côté; et nous croyons qu'il n'agit pas légèrement. L'art dramatique, réduit à la seule mémoire, n'a plus d'action sur la foule."

THE SCARCITY OF SOUND INVESTMENTS.

THE growing scarcity of sound investments is a phenomenon that is forcing itself upon the attention of the least observant of those who have any money to put by. Only a few years ago French Rentes yielded over 5 per cent. on the market price, and not very long since United States Government Bonds could be bought to return 7 and 8 per cent. Where now can securities such as these be found to give a like income? Consols are no longer at par, but they are so little under it that practically they may be said to yield only 3 per cent.; United States Fours yield about 3½ per cent.; French Rentes about 4 per cent.; Indian Sterling Bonds not quite 4 per cent.; and Colonial Government securities generally about the same rate. Even Russian and Hungarian bonds, great as is the risk attached to them, pay an investor only 5½ and 6½ per cent. respectively. And if we pass from the securities of States to those of private Companies we find that those in good credit give usually from 3 to 4 per cent., but seldom more. It is obvious, too, that the tendency is to reduce still lower the return to the investor. In other words, really good investments are becoming scarcer and scarcer every year, and of course their scarcity enhances their price. It is a common complaint that all Stock Exchange prices at present are extravagantly high, not alone in England, but all over the world; and though to a certain extent this is due to speculation, fostered by the abundance of capital in the short-loan market, the permanent tendency of events is to lower the interest of money. The principal cause of this is the magnitude of the annual savings in the more advanced countries of the world. In his paper on "Recent Accumulations of Capital" Mr. Giffen estimates the annual savings of the United Kingdom in the ten years from 1865 to 1875 at 240 millions. Granting that the depression in trade and the series of bad harvests have since greatly diminished the rate of accumulation, still the savings every year must have been enormous. Part of these were invested in bringing new land into cultivation—a process which went on even in 1879, perhaps the worst year of the century; part in improving land previously cultivated; part in ship-building; part in renewing and replacing the mechanical appliances used in industry; part in house-building; and part in founding new businesses or extending old ones. But there remained a large balance, which flowed to the Stock Exchange for investment.

The busy man and the idle man alike who have surplus money wish to invest it in a manner in which, if there should be need, it can be easily realized, and in which, while out of the owner's control, it will not call for his supervision, or give him any trouble. On the Stock Exchange alone can he usually find a security of the kind. And accordingly there is always an immense sum seeking employment there. It has been said—we know not upon what basis of calculation—that at the present moment there are 200 millions in this country waiting investment. Whatever may be thought of this estimate, it is certain that the amount is enormous. In France it is generally estimated that, in spite of the loss of Alsace-Lorraine, of the ravages of the *phylloxera*, and of the series of bad harvests, the annual savings are about 120 millions sterling. We are inclined to think this estimate too low. It is only half Mr. Giffen's estimate for the United Kingdom during the period 1866-75; and France, we know, is making marvellous progress in wealth, her people are among the thriftiest in the world, and the national riches are so widely distributed that very few amongst them are without the means of saving something. They invest upon the Stock Exchange far more generally than English people do, and consequently the demand for Stock Exchange securities is very great in France. It is hardly necessary to say anything of the great and rapid growth of wealth in the United States. Estimates of the rate of growth must necessarily be very conjectural, but we may safely conclude that the annual savings are not less than in the United Kingdom. Thus for these three countries alone we arrive at a grand total of about 600 millions sterling of annual savings. If this conclusion appears incredible to any of our readers, we would remind them that Russia, the poorest of the great European States, was able to defray the whole cost of the war against Turkey out of her own savings. Not having been able to raise a loan abroad, she was compelled to borrow at home - that is to say, to defray the cost of the war out of the funds in her own loan market. If the savings of Russia sufficed for this purpose, our estimate for England, France, and the United States is clearly not exaggerated.

The demand growing out of this vast saving necessarily enhances prices. And the effect is intensified by the rapid diminution of existing first-class securities, and the rare creation of new ones. Since the close of the Civil War the United States have paid off nearly 160 millions sterling of their debt, and they have converted the greater part of the remainder into a debt bearing only 4½ and 4 per cent. interest. The Sixes and the Fives still outstanding will fall due and be refunded next year. When this process is completed, nearly one-third of the United States Debt will have been swept away, and of what will be left not a single bond will bear more than 4½ per cent. interest. Moreover, the reduction in the charge of the debt will be such as to make it possible, if the people so choose, to clear it bodily away in about fifteen years or less. In other words, United States bonds will by-and-by not be obtainable in Europe. Compared with what the Americans have done, our efforts to reduce debt have been trifling. Still we have greatly diminished the funded debt during the past twenty years, and in 1885, when the Terminable Annuities fall in, it will be in the power of the Chancellor of the Exchequer of that day, provided peace is preserved, to put in operation a scheme that will rapidly reduce the debt. Further, Turkey's repudiation of her debt in 1875 destroyed at a stroke what had previously been considered a vast property. And the bankruptcy of so many other States has still further narrowed the area of investment. Against these reductions and disappearances the only great creation of first-class securities within the past ten years has been the French Indemnity Loans. It will be seen, however, if we add together the repayments by the United States, England, and Germany, and the repudiations by Turkey and Peru, that the latter greatly exceed the new issues. In fact, since 1873, new issues upon a great scale have ceased. This is true of industrial and commercial undertakings as well as of States. As we saw last week in discussing the railways of the world, the United Kingdom has practically completed its railway system. Whatever may be done in the future, there can in this country be no vast railway constructions as in the past. France, Germany, Holland, and Belgium find capital for their own lines; Russia has not credit enough to raise a loan for the present; and Hungary is obliged to be cautious. It is the same with most of the colonies. At any moment a new mania for foreign loans may no doubt spring up, and railways may be financed for all sorts of places; but we are now dealing only with the present and the immediate past, and it is unquestionable that the issues of first-class securities have not kept pace with the reductions. At the same time the new savings constantly made have been seeking for investment, and have not been met by any new creations.

The inevitable result of this double movement is the rise of prices to which we referred above, or, in other words, a fall in the rate of interest. This is the natural tendency in all advanced communities. During the past forty years it has been counteracted by the construction of railways, which, in the United Kingdom alone, have used up a capital nearly equal to the present amount of the National Debt. The tendency has further been checked by the laying down of telegraph wires all over the globe, by the replacement of sailing vessels by steamers, and the substitution of iron for wood in naval construction, by the vast development of industry and manufactures, and by the immense loans made to foreign States. But there has come a pause in the creation of all these forms of investment, and instantly the permanent tendency of events asserts itself. The prices of securities rise, money accumulates in Lombard Street, and bankers complain that they can get nothing for it. Is this state of things likely to last? Are the saving classes permanently to make up their minds to a lower return for their savings? It is always hazardous to predict; but we are not inclined to give an affirmative answer to these questions. We see no reason to conclude that the era of mechanical inventions has abruptly come to an end; and, if it has not, we cannot suppose that our present instruments of production and locomotion do not admit of improvement. To take an illustration. If the Thomas and Gilchrist process of making steel turns out as well as is now expected, it is only reasonable to infer that steel will supplant iron in naval construction, just as iron supplanted wood, and consequently that we are about to witness a revolution in shipbuilding. Further, steel rails must take the place of iron rails. Even now this latter change is in progress. But, if steel is really so much more lasting than iron and so much cheaper as is said, railway directors will soon find out that the line which is first steel-laid from end to end will get an advantage over its competitors; and when once this is realized there will be a race between the Companies. But such a race would involve a revolution in the iron industry also, and a complete reconstruction of works; and none of these transformations can be effected without an immense expenditure. This particular forecast may or may not be fulfilled, but in any case the possibility shows how a single great invention may put all vaticinations to nought. Again, as we pointed out last week, the railway systems of the world are as yet in their infancy, will certainly be extended, and must use up vast capitals. Lastly, should a great European war break out, it would rapidly absorb the world's savings. It would be out of place here to inquire into the probability of a great European war; but nobody will deny that it is among the possible contingencies of the future. In spite, then, of the permanent tendency towards a low rate of interest, it would be rash to assume hastily that the inducements to saving are about to be diminished.

REVIEWS.

FOWLER'S LOCKE.*

It is difficult to refrain from doubt as to the wisdom or necessity of the rule which has imposed an inflexible uniformity of size on this "English Men of Letters" series. The handiness and cheapness of the volumes are laudable objects in themselves; and it appears to be assumed in all enterprises of this kind that not only a certain average size and price are to be maintained, but the size and price must be invariable for each individual member of the series. Doubtless English publishers know their public; and the intrusion, say, of a three-and-sixpenny volume into a half-crown series, would import a loss in copies sold not to be made up by subsequent redress of the balance in some two-shilling successor. The singularly artificial arrangements of our book-trade seem to have brought us into a state in which nobody will buy books unless they are very dear or very cheap; and in either case a certain tickling of the imagination seems needful to make the price go down. The cost of the luxurious library edition of a work whose standing is already assured must be counted in guineas; that of the cheap student's book must be expressible by some equally familiar, though humbler, unit of account. In the name of half-a-crown there seems to be a certain fitness of things, whereby in the subjective arithmetic of the book-buyer two half-crowns are manifestly less than three shillings and two shillings. Nevertheless, uniformity has its drawbacks; and it is a Procrustean exigency that compels Goldsmith to be treated on the same scale as Milton. And Professor Fowler must have chafed a little, we should guess, at the compass allotted to him in common with his fellows for his own particular task of setting forth Locke's life and work. In the case of Hume, Professor Huxley cut the knot by giving but a slight sketch of the man's life, and throwing his whole strength on a free and popular, yet concentrated, exposition of Hume's philosophy. With Locke this was hardly possible; the manifold activity and varied interests of his life could not fairly be dealt with in a less proportion of the whole book than has been allotted to them. We cannot say but that Professor Fowler has done well, though the account of the *Essay concerning Human Understanding* for which room is thus left is perforce very slender indeed. With the execution, too, we have every reason to be content; the tale is well and pleasantly told, and told with the scholar-like composure and absence of flippancy which become the matter of it.

Nevertheless, Professor Fowler has not escaped falling into a quarrel by his useful and, as we should have said, unpretentious piece of work. Four years ago Mr. Fox Bourne brought out a Life of Locke in two volumes, a careful and meritorious performance, containing many new facts and documents—unpublished writings of Locke's and other things of considerable interest. It was duly noticed here and elsewhere, and may be said to have established itself as not only the latest, but the fullest and best, account of Locke to be had.

* *Locke.* By Thomas Fowler, Professor of Logic in the University of Oxford. London: Macmillan & Co. 1880. (In "English Men of Letters" Series.)

This being so, Professor Fowler naturally made use of Mr. Fox Bourne's work, with such acknowledgment as he thought fitting to the nature of the case. We should suppose that Mr. Fox Bourne's Life was pretty constantly before him; now and then he seems to have followed it even in the turn of a phrase, which, however, may be due to fresh but unconscious reminiscence rather than to copying. But Professor Fowler, naturally enough again, did not think it needful to make a special note every time he gave a fact or document which had been given by Mr. Fox Bourne. Even in works of a larger scale we take the rule to be this:—If A. gives something material simply on B.'s authority, he ought to cite B. for it. But if, whether guided by B. or otherwise, he goes to the ultimate authorities which B. consulted and works from them, he is not bound to cite B. specifically, though his results may be the same. A general acknowledgment of having found B.'s work useful is all that literary justice requires. And we now know from the statement made by Professor Fowler in self-defence—which, being not improbable in itself, we are bound to accept—that he has by no means used Mr. Fox Bourne's work without verification, but has constantly verified and sometimes corrected it. What Professor Fowler has actually done in the matter of acknowledgment is this; in the prefatory note he says:—

In writing the chapters on Locke's Life, I have derived much information from the biographies of Lord King and Mr. Fox Bourne, especially the latter, which contains a large amount of most interesting documents never before printed. In a work like the present, where numerous foot-notes would be out of place, I am obliged to content myself with this general acknowledgment.

Most authors, we think, would accept such an acknowledgment as sufficient to cover any fair use of their work. But this is not all. Mr. Fox Bourne's name is mentioned eight times in the body of the work (not in foot-notes, but in the text); once it is to express a not unfriendly dissent on a point of which Mr. Fowler should be a particularly competent judge; every other time it is to approve some piece of Mr. Fox Bourne's work. Taken together, these references amount to saying, as plainly as words can say it, to every reader who has a tincture of literary habits:—"If you want to study Locke's life and writings more at large, Mr. Fox Bourne's book undoubtedly is the book you should go to." So far from tending to interfere with the reputation or sale of Mr. Fox Bourne's work, we should have thought this would be the best possible advertisement for it. And we should have expected a reasonable man in Mr. Fox Bourne's position to be content for the sake of this to have his work much more freely drawn upon than it appears to have been in this case. Unfortunately Mr. Fox Bourne has taken a different view of his rights and interests. He has written to the *Athenæum* charging Professor Fowler in unmeasured language with injustice, discourtesy, and plagiarism. Professor Fowler made a very temperate reply, stating in effect that he also had been at work on Locke's life and writings for many years, and that he had used Mr. Fox Bourne's book fairly and honestly in conjunction with other material. He also pointed out, in our opinion quite rightly, that Mr. Fox Bourne was really claiming a monopoly of the whole subject; for one of Mr. Fox Bourne's chief grievances was that Professor Fowler had gone to work without consulting him. At this rate, as Professor Fowler says, "literature"—and, we may add, science—"would be reduced within a very narrow compass indeed." No teacher of history would be free to speak of the mediæval constitution of England without an *imprimatur* from Professor Stubbs, and every student of physics wishing to investigate electrical discharges in a high vacuum would have to exhibit a petition to Mr. Crookes. Mr. Fox Bourne, however, rejoined by repeating his charges in a more offensive tone, and, among other things, rashly challenging Professor Fowler to make good what he had gently hinted in his first letter, that Mr. Fox Bourne's scholarship was not of the most exact. Professor Fowler has made a final reply, in which his assertion on this point is more than sufficiently justified as regards Latin. As to Greek, there is not much occasion for it in dealing with Locke; but Mr. Fox Bourne persistently gives ἐλαιωψορία for ἐλαιοφορία, the name of an Oxford collection of verses addressed to Cromwell, to which Locke contributed. He should have been thankful to Professor Fowler for correcting the mistake in silence. Meanwhile an unexpected diversion is created by Mr. Noel Sainsbury delivering in turn an attack on Mr. Fox Bourne, who, if Mr. Sainsbury's contention be right, has a beam in his own eye as concerning divers unpublished materials communicated to him by Mr. Sainsbury. For it was Mr. Sainsbury's intention at the time, as he alleges, to use these materials himself, and Mr. Fox Bourne knew it. He did not think it needful to complain when Mr. Fox Bourne's book was published; but now that Mr. Fox Bourne brings charges against other people of using his materials without his consent, Mr. Sainsbury thinks he may be fairly called upon to justify himself on his own principles. Mr. Fox Bourne denies the correctness of Mr. Sainsbury's statement of the facts. Here we have, as it stands, a very pretty triangular duel. It may go on two or three weeks more for anything we can tell, though Professor Fowler has wisely declared that, for his part, his last shot is fired. One thing is tolerably clear, that the person who comes out of the whole matter with most credit will not be Mr. Fox Bourne. There have been other unpleasant signs lately of a tendency among authors to display morbid jealousy about their claims, and fierce resentment of trifling or imaginary wrongs. We trust that English literature is not to be disgraced by a habit of wretched disputes about originality and priority, such as have become too common in several departments of science. And now, as they say in the Sagas, Mr. Fox Bourne is out of the story.

Professor Fowler's agreeable and scholarlike sketch of Locke's life will help to bring home to Locke's countrymen the practical occupations and active citizenship that distinguished him from many speculative philosophers. A sound currency, a free press, and the system of private arbitration under judicial sanction which is so powerful an auxiliary to our civil courts of justice, all bear in their earliest history the stamp of Locke's wisdom and manly sense. Another point not less worthy of note is that the calendar might have been reformed in England, if Locke could have had his way, some years sooner than it actually was, and that by a gradual and easy remedy, instead of by the sudden jump from old to new style which raised the cry of "Give us back our eleven days." The account of Locke's philosophical work suffers from condensation, as we have already hinted. It is impossible to explain in a few sentences the conditions which made the *Essay concerning Human Understanding* a new departure in mental science. Professor Fowler's words of introduction hardly do justice, we think, to Locke's immediate predecessors. He speaks of them thus:—

The science which we now call Psychology, or the study of mind, had hitherto, amongst modern writers, been almost exclusively subordinated to the interests of other branches of speculation. Some exceptions must, indeed, be made in favour of Hobbes and Gassendi, Descartes and Spinoza; but all these authors treated the questions of psychology somewhat cursorily, while the two former seem usually to have had in view the illustration of some favourite position in physics or ethics; the two latter the ultimate establishment of some proposition relating to the nature or attributes of God.

To confine ourselves to the two latter, this sentence would certainly give anything but a just notion to a reader unacquainted with Descartes's treatise on the Passions, and the third and fourth parts of Spinoza's *Ethics*. In these we have psychological studies which cannot be fairly pronounced cursory, and which are treated, though of course not without a view to ulterior ethical purposes, yet with a great deal of pure scientific interest. Descartes, indeed, has a good title to be reckoned, saving perhaps a part for Hobbes, as the founder of mental physiology. That his explanations were commonly premature and sometimes crude cannot seriously affect his merit when we allow for the conditions under which he worked. So that when Mr. Fowler says that Locke's task was undertaken "not in the dogmatic spirit of his predecessors, but in the critical spirit which he may be said to have almost inaugurated," there is again a touch of injustice towards Descartes. But it is perfectly true that it was Locke who first brought to the front the specific problem of knowledge, who forced men to consider, before they speculated at large on the nature of the universe, what human knowledge means, and of what it is capable. Vigorously and solidly handled by Locke, dissected by Hume, renewed on a different plane and with more elaborate method by Kant, this problem has with but slight intermissions, and with no really successful attempt at a diversion, occupied philosophers for well nigh two centuries; and it may be said that it is the one branch of philosophy in which an undoubted scientific progress has been made good. When Locke touches on purely metaphysical questions, his opinions are less interesting, and indeed comparatively commonplace. His position as to the relations of mind and matter—namely, that a supreme intelligence is necessary to account for finite thought, but that, given the supreme intelligence of God, it is quite conceivable that he should make matter think, if such were his pleasure, without interposing a finite spiritual substance—is well and clearly stated by Professor Fowler. This is worth noting, not only because the position is curious in itself, but because it is easily misunderstood, and has in fact been misunderstood by at least one ingenious writer of our own time. As a suggestion of what may be called a qualified and limited materialism, it is quite consistent; but, if the point of it is missed, Locke seems to be speaking as a materialist in one place and as a spiritualist in another.

Locke's minor writings are also duly noticed. On theological ground we occasionally find him in startling coincidence with the *Tractatus Theologico-politicus* of Spinoza, to which it is at least improbable that he ever gave much attention. Take the following passage quoted by Professor Fowler from *The Reasonableness of Christianity*:—

Natural religion, in its full extent, was nowhere that I know taken care of by the force of natural reason. It should seem, by the little that has hitherto been done in it, that it is too hard a task for unassisted reason to establish morality in all its parts, upon its true foundation, with a clear and convincing light. And it is at least a surer and shorter way to the apprehensions of the vulgar and mass of mankind, that one manifestly sent from God, and coming with visible authority from him, should, as a king and law-maker, tell them their duties and require their obedience, than leave it to the long and sometimes intricate deductions of reason to be made out to them. Such trains of reasoning the greater part of mankind have neither leisure to weigh, nor, for want of education and use, skill to judge of. . . . You may as soon hope to have all the day-labourers and tradesmen, the spinsters and dairy-maids, perfect mathematicians, as to have them perfect in ethics this way. Hearing plain commands is the sure and only course to bring them to obedience and practice. The greater part cannot learn, and therefore they must believe.

This is extremely like the idea which runs all through the *Tractatus Theologico-politicus* as to the necessity of revelation; though Locke seems more in doubt than Spinoza whether unassisted reason be sufficient even for the philosopher. And in his conclusion "that the articles of saving faith are few and simple," he stands much nearer to Spinoza than to the great majority of

writers on the subject, both at that time and since. Professor Fowler gives a good summary of the "Thoughts on Education," a work wonderfully in advance of its age, of which, by the way, two reprints have lately appeared. Of the tractate on the Conduct of the Understanding he says, with the bitterness of one in University authority who sees many strange things done in the name of knowledge, that "except for the inveterate and growing custom of confining works employed in education to such as can be easily lectured on and easily examined in," one cannot understand why it is nowadays so little read. It is pointed out, as a matter of course, that the doctrine of an original contract set forth in Locke's treatise on Civil Government is now quite untenable. Perhaps it might have been well to add that the one fatal difficulty that the supposed state of nature is a mere fiction was not overlooked by Locke himself. "'Tis often asked, as a mighty objection," he says, "where are, or ever were, there any men in such a state of nature?" The reply provided by him is ingenious, though it shows that the real might of the objection could not then be perceived. In matters of speculation it is not much, after all, that we find to add to the actual arguments of our forefathers. It is the grouping, the perspective, and the bearings of them that are changed by new facts and new points of view.

BIRDWOOD'S INDIAN ARTS.*

THESE volumes, prepared by Dr. Birdwood for the Art Series of the South Kensington Museum, contain an account, not only of the old Indian collection, but also of the additions lately made from the Museum of the Indian Office. At the same time the work is not a catalogue, but is intended apparently for general reading as well as special study. The part devoted to industrial arts is about two-thirds of the whole, and is preceded by a summary of Hindoo mythology. Even a summary of such a subject is not necessarily brief, and if Dr. Birdwood had adopted the method usually pursued by Egyptian mythologists his courage must have failed him before the completion of his task. He has, however, adopted the chronological method, and is able therefore to distinguish between what is ancient and what is modern, what is of importance and what may be lightly passed over. It would indeed be well for Egyptian studies if Dr. Birdwood could be induced to turn aside for a moment and give a little of his knowledge and experience to the unravelling of the network of ignorance and guess which at present oppresses the mythological student. In his researches as to the religion of our remotest ancestors—for from the old Aryan stock in the valleys of the Himalayas must have proceeded the modern people both of Europe and India—he goes direct to the early records in the hymns of the Veda, and shows that these primitive folk, who may have lived twelve centuries before the Christian era, or during the Hyksos domination in Egypt, expressed the sentiments of admiration, gratitude, and fear awakened in them by the overwhelming powers of nature; and that "the words uttered three thousand years ago by the Vedic bards, or *rishis*, gradually became the gods of India, Greece, and Rome." There is, of course, nothing absolutely new in this, but there is something new in the simple and systematic manner in which the gradual corruption of this primitive mythology is shown to have resulted in "the most puerile superstitions and the grossest idolatry." This degradation he ascribes chiefly to the sacerdotal pretensions and unceasing efforts of the Brahmans, or priestly caste, a caste which did not exist at the first. In order to bring in the aboriginal inhabitants they permitted the engrafting of the "gods of the land" upon the old Vedic theogony; and finally, when the religious revolution of Gautama had made Buddhism almost universal, they contrived to corrupt it also, so that at the present day there is little to choose between the older and the newer form of idolatry. The Jainas, says Mr. Birdwood, made a compromise with the Brahmans; resistance to caste and to the sacerdotal claims of the Brahmans once removed, the compromise became a conquest. Provided the rules of caste and their own supremacy were acknowledged, the priests allowed the utmost latitude of religious belief and philosophical opinion. Buddhism, in its purer form, indeed in any form, has almost or quite disappeared from India. It spread into Ceylon about the end of the third century B.C. and into Tibet and China during the first century of the Christian era; and Dr. Birdwood goes on to say, it "was carried in the fifth century A.D. by Chinese missionaries into Mexico, where it flourished until the thirteenth century, when it was extirpated by the victorious Aztecs."

In a series of small plates Dr. Birdwood gives us the figures of the principal deities—figures so familiar in all our houses, yet so seldom recognized by their names. In the present work we are told all about each one, and the author gives us besides a brief description of the sacred writings or Vedas of which we have heard so much lately, and tells the story of the Mahabharata and the Ramayana. He next notices at some length the code of Manu and its influence on the development—or, to speak more exactly perhaps, the arrest of development—of the Hindoo people. It is the legal foundation of the whole social, religious, economical, and political system of Hindoo life. It failed to provide for the external defence of the country, but it has rendered it proof against internal revolution. "India is, in fact, the only Aryan country which has maintained the continuity of its marvellous social, religious, and economical life from the earliest antiquity to the present day."

The second part of Dr. Birdwood's work contains a full and systematic description of Hindoo art and the "master handicrafts of India." The village communities have been the strongholds of the traditionary arts, for, as the husbandmen of whom these communities exclusively consist could not do without manufactures, a certain number of artisans came to reside in each village. There they reside as "strangers within the gate," even after the lapse of three thousand years. The artisans in the lapse of time sought employment in the larger towns and the "great polytechnical cities," and formed trade-unions, the bonds of which in India are rendered practically indissoluble by the force of caste. Dr. Birdwood is mistaken in attributing caste to the ancient Egyptians, but in this he only follows the misleading authorities to which we have already referred. Two things have acted unfavourably on the hereditary skill of the Hindoo craftsman in recent years. The authority of the trade guilds has been relaxed under the freedom of English rule, and the importation of our goods has forced many artisans into agriculture and even domestic service. Dr. Birdwood's remarks on this subject are extremely interesting, not only archæologically as bearing on the history of our own trade guilds, but also economically. It was under the Indian guild system that the sumptuary arts were carried to a state of perfection, "until at length the whole bullion of the Western nations of antiquity and mediæval times was poured into the East in exchange for them."

The only notice of gold plate in the Rig Veda is a mention of gold cups; but the references to jewelry are so frequent that the precious metals and stones must have been familiar to the Aryan immigrants from their earliest settlement. Yet no specimen of the art of gold-working has been met with which can with any certainty be attributed to the ancient period of Indian history. The oldest example now extant was found by Mr. Masson about forty years ago in a Buddhist tope in the neighbourhood of Jellalabad. In the centre of the tope was a small apartment constructed of squares of slate. A steatite vase was found in it, containing, besides mould and the ashes of burnt pearls, a gold casket filled with similar remains. By its side were four copper coins, by which the monument is assigned to one of the dynasty of Greco-barbaric kings who ruled the North-West of India about half a century before the Christian era. The ornaments of this casket are extremely curious. The Greek feeling apparent in them is most interesting. A plate of silver of similar design was long in possession of a family, the Mirs of Badakshan, who claimed to be descendants of Alexander the Great. Dr. Birdwood sees in these relics distinct evidence of the influence of Alexander's invasion on the arts of India. The Greeks, he asserts, had conquered all this part of India, had established a monarchy, and issued a coinage. Their money is well known, and is thoroughly Greek in character. Moreover, in the travels of Apollonius of Tyana he is said to have come upon remnants of Greek civilization and language in the former kingdom of Porus. The Buddhistic sculptures in the Punjab are due, says Dr. Birdwood, to Greek rather than Byzantine influence. It is true that their exact date is unknown. They may have been carved at any time in the thousand years between the middle of the third century B.C. and the middle of the eighth of our reckoning, and those which are later than A.D. 300 may have been influenced by Constantinople. But the date of this gold casket proves that its Greek look is due to direct Greek inspiration, and many specimens of carving in stone are now recognized as betraying a similar origin.

The Punjabese artists have retained a high reputation for skill goldsmiths. Their best known manufacture is in parcel gilt water-jars, graven through the gilding to the silver below. The illustrations Dr. Birdwood gives of objects in this kind of work are very pleasing. Still more pleasing are the copper-hammered work "lotas" from Tanjore, of which Dr. Birdwood gives several engravings. "In its bold forms" the brass work of the same place "recalls the descriptions of Homer of the work of the artists of Sidon." Some are simply etched, others deeply cut in mythological designs, and others diapered all over with a leaf pattern similar to that seen in Assyrian sculpture. Those encrusted with silver are the most beautiful, and the effect is wonderfully well rendered in some of the cuts. Enamelling, which Dr. Birdwood considers the "master craft of the world," is practised in great perfection at Jaipur (Jeypore) in Rajputana. It is "champlevé." A round plate presented to the Prince of Wales is the largest specimen ever produced, and took four years in the making. There is an engraving of a native writing-case in the shape of an Indian gondola, which is of admirable workmanship; the colours of the blue and green enamel being brighter even than the natural iridescence of the peacock's tail. The canopy which covers the ink-bottle is coloured with green, blue, ruby, and coral red enamels.

Of jewelry for personal adornment Dr. Birdwood gives a great number of fine examples. An amazing effect is sometimes produced by the simplest means, as, for instance, in necklaces made up of strings of pearls and gems, graduated so as to hang in the form of a rich collar. The effect to be produced is the chief aim of the Indian jeweller. He thinks only of the dazzling variety of rich and brilliant colours. "He must have quantity, and cares nothing for commercial quality, and the flawed 'tallow drop' emeralds, and foul spinel rubies, large as walnuts, and mere splinters and scales of diamonds, which he so lavishly uses, are

* *Indian Arts.* By Dr. Birdwood, C.S.I. 2 vols. Published for the Committee of Council on Education. London: Chapman & Hall, Limited.

often valueless except as points, and sparkles and splashes of effulgent coloring."

Dr. Birdwood peppers his pages plentifully with commas, and spells some words after a fashion unusual in England, as in the passage above quoted, but on the whole even what may be called the catalogue portion of the book is pleasant reading. The art of describing objects of art is not given to every one. We can overlook peculiarities of composition when the author is able to convey a clear impression in words, and this Dr. Birdwood does. He is well helped by the large number of excellent woodcuts with which his volumes are illustrated; but in the absence of colour his descriptions, florid as they may occasionally seem, are very necessary. In his preface, by the way, he makes a complaint which will find an echo in the minds of many students of Indian history and Indian art, to say nothing of Indian language. He has been much exercised, he says, with the spelling of geographical names. On this occasion, for the first time, he has submitted to use the official system. "I have given up," he cries in despair, "Sir Charles Napier's 'Scinde'; but I have not been able to give up Moore's 'Cashmere.' Whoever heard of the vale of 'Kashmir'?" There is much reason in the complaint. The spelling fixed upon for the Indian Civil Service is not English, but French; and, as Dr. Birdwood observes, Dam-Dam is not the real English pronunciation, but Dum-Dum; and Shirpur does not represent the sound of Sherepore. "I saw Kurnool the other day rhymed to skull, simply because the writer of the poem, himself an accomplished Orientalist, had been, in a heedless moment, misled by the official spelling of the word, *Karnul*."

GILL'S SAVAGE LIFE IN POLYNESIA.*

MR. GILL'S present contribution to our stock of information respecting savage life in Polynesia is of no slight value. It is not, perhaps, so generally interesting as his previous work, the very remarkable *Myths and Songs from the South Pacific*—a collection of antiquities, to use the words of Professor Max Müller, "showing us, far better than any stone weapons or stone idols, the growth of the human mind during a period which as yet is full of the most perplexing problems to the psychologist, the historian, and the theologian." The "Historical Sketches" deal with the rough realities more than with the picturesque fictions of savage life, and the work is somewhat monotonous in its records of sacrifices to fierce gods, its legends of internecine feuds, and its chronicles of cannibalism. But the testimony it bears has the great merit of being quite trustworthy; and Mr. Gill has done very good service by placing on record the heathenish traditions which must before long fade from the memories of the Christian descendants of the fierce islanders to whom they relate. He justly regrets that the early missionaries burnt the magnificent mahogany trees of Tahiti, the growth of centuries, on account of their supposed connexion with idolatry. It would have been a still greater loss if the legendary records of heathenism had been simultaneously rooted out of the minds of the converts to Christianity.

As might be expected, much may be learnt from these sketches about the former gods of Polynesia, although their ordinary themes are events due to the mutual relations of tribes or families. Thus the legend of "The Expelled God" tells how Tanè was once worshipped in the peninsula forming the southern part of Tahiti, "but was ignominiously expelled, on account of his man-devouring propensities," which gained him the appellation of "the yellow-toothed god." His sorrowing priest "hid the unpopular god in an empty cocoanut-shell, securely plugged the tiny aperture, and threw it into the sea, adjuring Tanè to seek a new home in some distant land." The shell drifted to Mangaia, where the priest found it. "On opening it he heard a chirp; it was his long-lost god Tanè, who henceforth was known as Tanè-Kio, or Tanè the chirper." Tanè is represented in Polynesian mythology as being the fifth son of the father of gods and of men, the fish-god Vâtea, whose name means "noon" in all the dialects of eastern Polynesia, and he is supposed to be enshrined in the sun. The morning star is sometimes called the eye of Tanè, and by one tribe the thunder is considered as his voice. Few of the legends are as distinctly mythological as that of "The Expelled God"; but, even in narratives of ordinary events, there sometimes occur references to now all but forgotten deities. We are told, for instance, that when the remnants of the defeated Teipe tribe sheltered themselves for months within a cave, although they found it very difficult to obtain food, they abstained from making use of the land-crabs and pigeons which abounded within their rocky haunt. "The reason for this was that they imagined themselves to be under the special protection of these rock-gods." On sacrifices to fiercer deities many of the stories turn. Mautara, the priest of the god Motoro, having been slighted by the chiefs of his tribe, revenged himself by declaring that Motoro desired that their first-born should be slain and eaten in his honour. So "on the day appointed these children, the flower of the ruling clan, were killed, cooked, and eaten by the assembled tribe." In after years Mautara confessed that the divine command was an invention of his own. On the eve of one of the great battles a priest of Tanè determined to offer his blood as a sacrifice to Rongo, in order to secure for his clansmen the favour of that god of war. The self-devoted victim took a sad farewell of his friends, and tranquilly entered the camp of his foes. They at once speared him, and so unwittingly ensured their own discomfiture. After a like fashion, the heroic Kauate "agreed to die on behalf of his tribe. Not, however, as an altar-offering to Rongo—that were impossible; but Kauate should seek a violent death at the hand of his foes."

Cannibalism forms a prominent feature in these records of Polynesian life. It was frequently practised as a religious duty, and on such occasions it was naturally respected; but it sometimes brought into discredit private persons who were addicted to it from merely sensual and selfish motives. Thus the cave-dweller Tangaka, who lived two centuries ago on human flesh secretly devoured, has left behind him an evil reputation, which is kept alive by the constantly recurring allusions in native preaching and praying to "Satan going about, like Tangaka, seeking whom he may devour." A warrior of the cannibal tribe of Ruanae "fell violently in love with a pretty girl called Tanuau, who repelled his advances and foolishly reviled him for his ugliness." Soon afterwards she died, and her dead body was let down by her relatives into the deep chasm which formed the burying-place of her tribe. The cannibal whom she had refused had meanwhile hidden himself and two of his friends within the gloomy abyss, and they secured the body when it was lowered. After the mourners had left, the cannibals emerged, bearing the corpse, which they carried to the seaside. But to their great disappointment. "it was found impossible to eat the decomposed body," and the rejected lover could revenge himself only by burning it. It seems that "the natives are absurdly sensitive to threats of burning anything belonging to themselves." One of the narratives tells how a woman who had been captured by cannibals was obliged herself to heat the oven in which she was about to be cooked. It will be remembered that in folk-tales it is often said that a clever hero or heroine, who has been captured by an ogre or ogress, is ordered to heat the oven for a similar purpose, pleads ignorance of the proper mode of procedure, is instructed how to act, and seizes the first opportunity of baking the instructor in his or her own oven. Mr. Gill's sketches of cannibalism will prove of special value to those commentators on popular tales who recognize in these time-honoured fictions reminiscences of savage life. Vague memories of days in which men ate their captives may reasonably be supposed to account for the attribution of man-eating propensities to Ghouls, Rakshasas, Giants, Baba Yagas, and all the rest of their monstrous brood. No very great light is thrown on other obscure features of popular fiction by the customs described or the stories narrated in the present work. But here and there a personage figures or an incident occurs which is worthy of notice on account of its likeness to some being or event with which we have long been familiar in European popular romance. Thus Polyphemus finds a parallel in Ngako, the employer of Vaina, and his sister Mangaia, young people who long cooked for him the human victims which he caught by day and ate by night. At length his hunting began to prove unsuccessful, and the time was evidently drawing near when he would devour his cooks. While Ngako slept soundly one night, "Vaina felt sorely tempted to take up the cannibal's spear and drive it through one of his eyes into the brain." But, instead of doing so, he and his sister took to flight and escaped. A Polynesian variant of the "Sleeping Beauty" myth is afforded by the legend of "Tavare, the profound sleeper, so named because she was in the habit of sleeping from the month of Pipiri (July) until the bread-fruit was ripe and crabs were plentiful (February). During all these months her limbs were rigid; but at length the fervid rays of the sun relaxed her muscles and put an end to her sleep." And to the list of stories about bird-husbands may be added that which describes the birth of the first inhabitant of Atiu. A pigeon flew to that island from spirit land, and rested for awhile beside a spring in a grotto. Presently "it noticed a female shadow of great beauty in the fountain." Now the pigeon "was in reality one of the gods, and therefore readily embraced the lovely shadow, and then returned to its home in netherland. The child thus originated was named 'Atiu'—'first fruit' or 'eldest born'—and from him the island derives its name." Polynesian deities are often represented as appearing under the forms of animals. Thus, Motoro "is supposed to be enshrined in the blackbird," and Tanè of the Barringtonia tree in sprats; Tinio is "supposed to be incarnate in the eel and shark," and Teipe in the centipede.

Many of the traits of savage life contained in Mr. Gill's sketches are worthy of mention. It seems that it was an invariable custom in olden times to enjoy a feast before going to battle, as the revellers might not survive to eat again. On the eve of a fight the chieftain Arekare went with his ten wives to catch fish for the usual banquet. To one of these wives, Eiau, the beauty of her day, he was tenderly attached. So on the way back he pushed her over a precipice. She was much disfigured, though not killed, by her fall, which her husband attributed to "an accident." But "Eiau easily divined the truth; it was the clear presentiment in his mind that he would be slain tomorrow, and then the lovely Eiau would belong to one of his mortal foes. Arekare's grief was that she was not killed outright." A quaint grimness relieves the monotony of one of the stories of bloodshed. One set of warriors surprised another by night. Stealing up to the unsuspecting sleepers, the invaders proceeded to select their victims. "Each head was gently lifted up. If heavy,

---

being clearly the head of a warrior, it was immediately clubbed; but, if the head proved to be light, the owner was permitted to sleep on until daylight, as it was evidently the head of a coward." The Christian inhabitants of Mangaia now eat their supper by lamp-light. But it was formerly the custom to sup before the setting of the sun, in order to avoid a surprise. The proverbial saying "Hasten our meal, or the Aitu will be upon us, bringing terror, chilliness, and death," keeps alive the memory of a great massacre perpetrated by the Aitu tribe, when entire families were destroyed while assembled at their evening meal. Nowadays feasts are enjoyed in all security. Mr. Gill gives a very interesting account of a sumptuous banquet celebrated in honour of three fish-nets which had been made at Tamarua. "The entire pecuniary value of the food disposed of would be about eight or ten times the worth of the nets. But then it is ever considered a mean and disgraceful thing for a chief to make and use such nets without inviting all the magnates of the island to a feast." The islanders are much addicted to singing, and Mr. Gill gives numerous specimens of their songs. Many of them are noteworthy; but perhaps the most interesting among them are the two cantatas which commemorate Captain Cook's visit to Mangaia, one of the singers declaring that

> Tangaroa has sent a ship
> Which has burst through the solid blue vault,

and the chorus exclaiming,

> A boat full of guests is here.
> What gibberish they talk.

THE REBEL OF THE FAMILY.*

THE materials of Mrs. Lynn Linton's latest story are in their essence familiar enough to novel-readers. A mother who makes a hard struggle to keep up appearances; her daughters, only one of whom—the Rebel—is a disappointment to her pride in her careful education; two or three men with whom the daughters flirt with varying results, and a hero to marry the heroine, are the chief characters in a story which has, it need hardly be said, a great deal of cleverness and has also a great deal of oddity. It may be said that some of its oddities give the book an additional interest, in that the reader's attention is roused, apart from the intrinsic merit of the story, by an ardent desire to find out whether what seems at moments the author's advocacy of strange views is serious or not, whether she means to sympathize with or to laugh at her heroine's convictions and inconvenient theories, and whether or not she thinks Perdita's example a desirable one, on the whole, to follow. On none of these points is the reader likely to get much satisfaction; for at one moment he will think that Mrs. Linton is disposed to applaud, at another to condemn, the unattractive, if conscientious, ways of the Rebel of the Family; and he may even cherish a secret doubt whether there is not a considerable touch of sarcasm in the author's eloquent approval of her heroine's marriage with a chemist and druggist, whom she exalts into a hero because he has pulled her back from the brink of the pond in Kensington. Such a marriage may no doubt be a fitting one for a well-brought-up and well-educated young woman who prefers the intimate friendship of questionable people to association with her own mother and sisters, whom she is for ever offending by her gross want of tact and even of manners. But in the matter of manners Perdita is not the only eccentric character in the book. On one point, that of the woman's rights agitation, Mrs. Linton's opinions seem to be clear enough. Her portrait of Mrs. Blount, or Bell Blount, as she preferred to be called, is as forcible as it is unsparing. In executing it with complete fidelity, the author has once or twice had to deal with somewhat risky matters, and has dealt with them with marked skill. The scenes in which Bell Blount figures cannot possibly be pleasant, in the sense in which a pretty landscape is pleasant, and some of their features are markedly unpleasing; but Mrs. Linton knows where to insist and where to touch lightly, and the whole result is what no doubt she aimed at—to exhibit in a strong light some of the absurdities, and worse than absurdities, connected with a movement which she seems to dislike. The character is, as we have said, drawn with remarkable strength, and in many of its touches there is a strong, if grim, sense of humour. A good description of Mrs. Blount's home occurs when Perdita, the Rebel, goes to pay her a second visit:—

> Never had the unlikeness between her own home and this struck her more forcibly than it did to-day. At West Hill Gardens every thing was laid out for show and kept in perfect order. Litter of any kind was a crime in Mrs. Winstanley's eyes, and work did not excuse snippets. Here in Prince Christian's Road, beauty, arrangement, order, were conspicuous by their absence, and the room had a queer hybrid look, as if tenanted by men who owned some of the furniture of women and not all of their own. The table was littered with pamphlets and reviews, old envelopes and letters, bills, journals and general waste; on the chimney-piece, among some common vases filled with half-decayed and neglected flowers, stood a box of Spanish cigarettes; one slipper, much worn and down at heel, had been flung into one corner of the room—its fellow was under the table and a pair of boots stood against the wall. The white shavings in the fire-place were strewed all over with half-burnt vestas and torn scraps of paper; and the bar of the fender was scratched and bent by the incessant wearing of feet. Bottles of beer, soda-water and brandy were on an ill-kept kind of chiffonier; a plate of water biscuits stood near; the carpet was covered with crumbs. The whole place was bare, mean, unlovely, disordered; and yet neither Mrs. Blount nor her friend looked poor. They were hideously dressed in expensive clothes, and they wore a good deal of jewellery; and though Miss Tracy was a thin, half-vitalized, vaporous little creature—one of those lean kine not to be fattened up by any amount or quality of food—Mrs. Blount's whole person bore evidence of good living—of flesh made firm by meat and blood rich by stimulants.

Another very well-drawn character is that of Mr. Brocklebank the ironmaster, who is the one hope of the Winstanley family, and who, though refused by one daughter, ends by marrying another. His father, who, from being a puddler, had risen to make a fortune, "had never been able to overcome his difficulties with the English language, nor to master the relative uses of his knife and fork." Brocklebank *fils*, however, had early enough got over these difficulties; "and, though his bearing wanted that last subtle polish of inherited good breeding, he was not actively offensive, and, as he used to say of himself, might pass in a crowd without disgrace." He scorned to say "begin," as he scorned to wear fustian; "but clung to 'commence,' as the sign of a scholar who knew his syntax and what was due to polite society and himself." His manner, "masterful, yet kind, was destitute of grace, even when wishing to be most courteous; never shaking off its clumsiness, and always traversed by a thin line of unconscious brutality." The characteristics here set forth, at greater length and with more minuteness than our quotations indicate, are preserved with striking consistency throughout the book; and the ironmaster, odd, affected, and unusual as his ways and manners are, never seems for a moment unnatural. His relations with the Winstanley family, his well-meant but dictatorial patronage, his instant recognition in Perdita of the fine qualities which her mother and sisters have overlooked, his indecision as to which of the girls he shall propose to marry, and his conduct when Perdita takes him completely aback by refusing him—all these things are managed and told with remarkable skill and truth. Bois-Duval is another personage who does credit to Mrs. Linton's talent. He seems to us, oddly enough, to be far better done than are the two young Englishmen with whom he and his friend come in violent contact. We have said above that Perdita is not alone in *The Rebel of the Family* in the singularity of her manners, and that this is so will be plain enough if reference is made to the scene between the Frenchmen and the Englishmen on the sands at Trouville, and to that between Mrs. Winstanley and Lady Kearney in Lady Kearney's own drawing-room. The days are surely past when a quarrel about Waterloo between a French and an English gentleman was a probable event; and at any rate a young man of Sir James Kearney's habits and education is not likely to begin such a quarrel in the presence of ladies. Yet more surprising, perhaps, is the little scene which ends the chapter in which this occurs. The conversation turns on the want of sunshine in England, and Sir James, turning to Eva Winstanley, who is the cause of the anger with which the Frenchmen and Englishmen view each other, says:—"If you say this is brighter, it is so, Miss Eva. But some faces in England make one forget the comparative want of sunshine."

> At which Eva laughed and said: "How nice! what a pretty speech!" while M. le Vicomte de Bois-Duval turned a shade paler than usual, as he raised his eyes with an odd impertinent look to Sir James, and said in an affected voice:
> "Well said. Ma foi! Monsieur is almost gallant enough to be a Frenchman!"
> "Do you mean that for a compliment, M. le Vicomte?" asked Sir James.
> "Surely! the highest I could pay," answered the Frenchman.
> "And I regard it as a piece of decided impudence," said Sir James angrily.
> "My dear friend!" remonstrated Mrs. Winstanley.
> "Do not insult us by having a quarrel in our presence," said Thomasina in a low voice.
> Little Eva sighed like a troubled child.
> "Oh dear, how cross you all are!" she said with a pretty pout. "You are spoiling all our fun by your ill-temper."
> "Allons! Miss Eva is right! It is bad form!" said the Vicomte gaily. "Vive la gaieté! vive la bonne humeur! à bas le spleen! and let the best man win!"
> "Win what?" asked Eva innocently.
> "Paradise!" answered Bois-Duval.

Lady Kearney's conduct to her guest is even more amazing than this. Mrs. Winstanley, whom Lady Kearney thoroughly dislikes, has been praising Sir James as "so kind to my girls—so nice that I should not know what to do without him—so amiable and friendly"; to which Lady Kearney replies, with a drawl, that when her son "has to work for his daily bread, as your daughter Perdita was so anxious to do, I shall feel justified in asking you for a character as lackey. You describe the functions admirably." Mrs. Winstanley, preserving her temper admirably, goes on, when Lady Kearney complains, with obvious intention, of the acquaintances which her son chooses to make, to offer her assistance in keeping him in order:—"The young of the present da[illegible] too independent; but I will help you with your son, [illegible] "I do not suppose, Mrs. Winstanley, that you mean to i[illegible]," cries Lady Kearney, and presently afterwards says, "When did I permit you to take this tone of intimacy?" Mrs. Winstanley, all smiles, makes a soft answer, and ends with "Your house is so delightful, dear Lady Kearney; but we must go." "'Never to be admitted again,' said Lady Kearney, even before they had gone." This, it will be admitted, is odd enough, and it is pleasant to return from it to the treatment of Bois-Duval's character. The scene between Thomasina and him strikes us as being on both sides one of the very best things in the novel. It is Mrs. Linton's merit

---

* *The Rebel of the Family.* By E. Lynn Linton, Author of "Patricia Kemball," &c. 3 vols. London: Chatto & Windus. 1880.

that, except in the case of the heroic chemist and druggist, she does not take a one-sided view of any of her characters. There is good even in Bois-Duval, scoundrel as he is, and there is much good in the worldly-minded and mercenary Thomasina, who has the cleverness and the courage to put herself into Bois-Duval's power in order to save her sister, the flirt who affects the *ingénue*, and whose flirting has for once gone too far. Closely veiled Thomasina goes off to pay a visit to Bois-Duval at his hotel, and to extract from him a promise to discontinue at once his making love to Eva:—

> It was a tremendous thing to do, but Thomasina had calculated closely. It was just the kind of thing that would touch the imaginative chivalry of a Frenchman; and Bois-Duval, though unscrupulous and dishonourable, had his high lights like the rest of us. And, more than this, it flattered his vanity that this frosty Venus, this impenetrable and excellent Thomasina, should thus put herself in his power, should abase herself so far before him, should trust so grandly to his generosity, to his honour as a Frenchman, to his dignity of man.

The scene is throughout capitally given. We have said as yet comparatively little of Perdita herself. Her character is drawn with great care and truth, but, we confess, interests us less than it was perhaps meant to do. We trust that she was as happy as may be with her chemist and druggist, but we do not think it unlikely that he got considerably bored with her.

JEANS'S LIFE AND LETTERS OF CICERO.

MR. JEANS seems to have been much exercised by the difficulty of choosing a suitable title for his work. On the title-page is set forth the lengthy description quoted below. A fly-leaf is more modestly inscribed, "Cicero's Letters," while golden characters on the binding boldly announce the volume to be the "Life and Letters of Cicero." The fact is that the book is nothing more or less than a good and useful translation of the selection of Cicero's letters generally accepted for the purposes of competitive examination. Mr. Watson's *Select Letters* are well known, and any one who might undertake to publish an English version of them was sure of the gratitude both of weak-kneed students who require such assistance in reading any classical work, and of those who, without possessing a knowledge of Latin, wish to have access to the original authorities on a period surpassing in interest almost any other in the whole range of ancient and modern history. But this selection does not constitute even such a Life of Cicero as might be compiled from his letters. It was made with the view of throwing light not so much upon the life and character of Cicero as upon the general history of his time; and Mr. Jeans has no more claim, on the strength of a few historical notes, to the honours of a biographer than a mender of spectacle-cases has to the title of optician.

As a translator, however, he deserves high praise. His undertaking was not an easy one. He attempted, as he tells us in the preface, "the somewhat difficult task of steering a middle course between a critical translation of Cicero's Letters for the scholar, and a Life of Cicero, told mainly by himself, for the English reader." Perhaps many scholars will be of opinion that he has approached more nearly to the latter than to the former extreme. Indeed a scholarly translation of Cicero's letters and speeches is hardly possible in the same sense in which it is possible of Homer or Virgil, of Thucydides or Tacitus, or of the philosophical treatises of Cicero himself. In such writings as these the charm of style consists in a literary excellence which appeals almost as much to any one age and nation as to any other, and the work of the translator is to reproduce in his own language every shade of meaning and every turn of expression, rendering as closely as possible each phrase, and even each word, of the original. How thoroughly this may be done without sacrificing elegance of English has been shown by recent translations of Greek poetry. But in rhetorical and epistolary composition much of the point depends upon allusions to current events of no permanent interest, and to contemporary institutions and customs which have long since passed away, and, in the case of letters, upon the use of colloquialisms bordering on slang. Hence a close and strictly "scholarly" translation would be always dull, and often unintelligible, and the translator must have frequent recourse to paraphrase if he wishes to convey to modern readers any real idea of his author's style and meaning. This Mr. Jeans does not hesitate to do wherever it seems necessary, and he has not perhaps altogether avoided the mistake, natural in such circumstances, of undue expansion for the sake of clearness. To give one instance, "my absolute confidence in your abilities" is a rather lengthy rendering of "te uno fretus." But he always writes good English, and he always gives us his meaning free from any obscurity. In rendering the Greek words and phrases scattered so plentifully through the letters, Mr. Jeans has carried out, wisely or not, Professor Tyrrell's suggestion that they should be generally translated by French equivalents. His efforts in this direction have been very successful; and it is seldom that he has failed to find French expressions corresponding with Cicero's Greek. In the seventh letter, however, he seems to us to be quite wrong in translating *μαλ' ἀριστοκρατικῶς* by "en grand seigneur." Cicero is here speaking of an harangue of Pompeius in support of the Senate, and the meaning of course is that Pompeius spoke as a firm adherent of the senatorial party, whereas the words "en grand seigneur" have a social rather than a political significance. But this is almost a solitary instance of a perversion of meaning caused by the use of French phrases.

More questionable than this whimsical device is the step which Mr. Jeans has taken in replacing Cicero's Greek quotations by corresponding passages from Latin authors, on the ground that Homer was to Cicero what Virgil and Horace are to a classically educated M.P. of the present day. His needlessly self-imposed task has here been rendered comparatively easy by the countless imitations of Homer to be found in the Æneid; but in rendering quotations from sources other than the Iliad and Odyssey he shows considerable ingenuity. In Letter 47, Cicero, speaking of Cæsar's doings, quotes from Euripides the line:—

> *τὴν θεῶν μεγίστην ὥστ' ἔχειν τυραννίδα.*

Mr. Jeans translates, "For the sake of empire,

> 'Quo nihil majus meliusve terris
> Fata donavere bonique divi.'"

An amusing feature in this rendering is the fact that Horace's lines are written in somewhat fulsome praise of the nephew and successor of the very man whom Cicero is attacking. Again, in Letter 37, "Deus ex machinâ" represents admirably the general idea of "*κωμικὸς μάρτυς*." We may remark here that neither Mr. Jeans nor Mr. Watson in their notes gives the real meaning of *κωμικὸς μάρτυς*, which is not "a comic witness," but "the witness in a comedy." The expression may be compared with "comicos stultos senes," which occurs in the treatise *De Senectute* in the sense of "the foolish old men of comedy." In the rendering of Latin words into English Mr. Jeans is often happy. "Crotchety" is an exact equivalent of "perversus" in Cicero's account of the Consul Piso, and "stump orations" well translates "Conciones"; while "the tribe that 'breed of barren metal'" aptly suggests the only derivation which can be given of the curious word "tocullionibus." Perhaps the translation of the words in Letter 38, "in quo regendo habeo negotii satis," by "I have enough to do to keep him straight," may be objected to as bordering too closely on slang; but it exactly expresses the meaning. In the Seventh Letter Mr. Jeans's anxiety to find French equivalents for Greek words has led him to overlook the English expression "blow one's own trumpet," which would translate "*ὡς ἐνεπερπερευσάμην*" even better perhaps than "Comme je me suis pavané"; and in the next sentence he has missed an excellent chance of introducing Mr. Puff's promise of "trope, metaphor, and figure as plentiful as nouns substantive," in translating the Greek list of the rhetorical figures which Cicero poured forth for the edification of Pompeius. On the whole, however, Mr. Jeans is to be congratulated on the thorough way in which he has accomplished his task. He has, of course, had the great advantage of following in the track of Mr. Watson, and he has scarcely overstated his obligations to that scholar when he says that he is indebted to him in almost every line of his work. But, after making allowance for this advantage, and for the assistance which he has received (and so very freely acknowledged in the preface) from his colleagues, his pupils, and, above all, from his college tutor, there remains a large amount of laborious and scholarly work for which in these days of short cuts to knowledge we can scarcely be too thankful.

Mr. Jeans does not in his historical notes throw any new light upon the period over which the letters extend, or upon the character and opinions of Cicero himself. His most valuable contribution to a right understanding of the latter question consists in the distinction which he justly draws between the two classes of letters represented respectively by most of those to Atticus and most of those to less intimate friends. Many of these latter are, as Mr. Jeans points out, in no real sense private documents. They were intended, no doubt, to have a wide circulation at the time and to be published afterwards; which, to quote Mr. Jeans, "does not make the letters one whit less valuable, but entirely alters the light in which they are to be regarded." But, apart from the motives with which various letters were written, Cicero's opinions of his contemporaries are in most cases utterly worthless. He was incapable of seeing the merits of any one who failed to show the highest respect to himself; he could find a good word even for Cæsar, after receiving a little personal attention from him; and his verdict generally depends upon the considerations which guided him in his estimate of Messalla, the consul for the year 61:—"Messalla consul est egregius, fortis, constans, diligens, nostri laudator, amator, imitator." It is probably Cicero's miserable vanity and littleness of mind which has made it seem to such authorities as Mommsen impossible that he could have been a real political power in such disturbed times. But, whatever may have been the causes of his influence, the efforts to gain him over which Cæsar made, both personally and through Antonius, Balbus, and Cœlius Rufus, prove that he possessed it. No doubt there were in Italy a vast number of respectable persons whose inclinations were slightly on the side of the constitutional party, but who wished, above all things, to enjoy peaceably their own possessions. Any scruples of conscience which they might entertain about transferring their allegiance to Cæsar would be at once got over if he could gain the countenance of so respected an adherent of the Optimates as Marcus Tullius Cicero. In a remarkable passage, which we may quote both as an example of Mr. Jeans's style of translation and as a striking proof of the state of public morality at the

[1] *The Life and Letters of Marcus Tullius Cicero.* Being a New Translation of the Letters included in Mr. Watson's Selection, with Historical and Critical Notes. By the Rev. G. E. Jeans, M.A. London: Macmillan & Co. 1880.

time, Cœlius Rufus gives, with cynical frankness, his opinion on the subject of political consistency:—

> You are not, I feel sure, blind to the fact that where parties are divided within a country we are bound, so long as the struggle is carried on with none but constitutional weapons, to support the more honourable cause, but when we come to blows and to open war, then the safer one; and to count that cause the better which is the less likely to be dangerous.

Of course many persons who privately entertained such opinions as these would hesitate to declare them in so robust a fashion, and to people of this class a precedent established by a man of Cicero's reputation would be of the highest value. It is easy to make too much of Cicero's inconsistency. We have, as Lord Macaulay pointed out, no right to blame a man excessively for not being in advance of the morality of the age in which he lives; and when we apply to Cicero's conduct a standard higher than that by which we try his contemporaries, we tacitly admit our consciousness of his superiority.

We ought not to close our notice of Mr. Jeans's book without drawing attention to the excellent index, which, so far as we have been able to test it, is complete and accurate.

MYSTERY PLAYS.*

THE extraordinary riches of early French literature, and the wide distribution of its treasures over all the libraries of Europe, have made it up to the present time a matter of no small difficulty for even accomplished scholars to draw up complete accounts of the exact contents of any one of its subdivisions. For at least half a century the work of exploration has been incessant, and yet fresh discoveries continually turn up. As we write, for instance, there lies before us a just issued reprint of a volume recently discovered in the Copenhagen Library, and containing, besides five farces already known from the famous British Museum collection and other sources, four which are entirely novel. Yet there are few divisions of early French literature which have attracted more attention than the drama. Those incessant accretions of material make the task of the literary historian difficult. Nevertheless, one by one, the divisions of this task are being attempted. The *Chansons de Geste* have already received all but exhaustive treatment at the hands of M. Léon Gautier. The theatre, sacred and profane, occupies the work of which the first division has now appeared. The author, M. Petit de Julleville, has already won his spurs in another part of the same field by a very satisfactory popular edition of the *Chanson de Roland*.

A study of the Mystery plays (it should be said that M. Petit de Julleville, like almost all good authorities nowadays, inclines to the belief that *mystère* is rightly spelt *mistère* in the old texts, and that its origin must be sought in *ministerium*, and not in *μυστήριον*), is not only important with reference to the general history of the stage, but in many other ways. No branch of mediæval literature gives us a greater insight into the character and peculiarities of the people who produced it; none illustrates more fully the immense gap which lies, hardly traversable save by laborious study aided by sympathetic imagination, between these days and those. Nor, it may be added, does any more require the assistance of a competent historian, in the case of all but very devoted students. For the most fertile period of Mystery writing was not, unfortunately, the palmy time of mediæval literature. Although we luckily have many interesting relics of earlier times, the bulk of the French Mystery plays which we now possess dates from the fifteenth century, and the god of the fifteenth-century's literary idolatry in France was length. The only appropriate adjective for most of the performances of that time is "enormous." They take days to read, they took weeks to act; heaven only knows how long they took to write. The most famous of all, the *Passion* of Arnoul Gréban, has thirty-four thousand five hundred and seventy-four lines, and fills four hundred and fifty royal octavo pages, double-columned and printed in small type, in the excellent edition of MM. Gaston, Paris, and Raynaud. The vast *Mistère du viel Testament*, which M. de Rothschild is now republishing, has some fifty thousand verses. Another *Passion* has sixty-five thousand; the *Acts of the Apostles* by the two Grébans, sixty-two thousand; the *Roi Avenir*, thirteen thousand; *Sainte-Barbe*, twenty thousand; *Saint-Christopher* (sixteenth century), twenty thousand; *Saint-Quentin*, twenty-four thousand; *Saint-Vincent*, thirteen thousand; the "profane" Mystery of *Troy*, thirty thousand; that of the *Siege of Orleans*, twenty thousand. When it is remembered that these are only the tritons scattered here and there among shoals of minnows of lengths varying from one to seven or eight thousand lines; that the conscientious reader who desires to study the whole subject at first hand must add, among many other things, a collection of fourteenth-century *Miracles de la Vierge*, which, though not long individually, give some eighty thousand verses in all; and that the great majority of the texts are only accessible in manuscript or black letter, the need there is of a judicious go-between becomes pretty evident. More especially is this the case because the Mysteries, at least those of the later period, are not cheerful reading on the whole. They are of course very different from the entirely imaginary mixtures of buffoonery and dulness which Boileau conjured up, and which the eighteenth century, with some exceptions (including, to his honour be it said, Voltaire), accepted. They do not deserve the harsh verdict of Sainte-Beuve, who was not disposed to carry his charity much beyond the sixteenth century, which he had himself re-discovered. But we can endorse M. Petit de Julleville's very honest and candid avowal that the study of the French mysteries, though they are by far the best of their kind, is, on the whole, "une entreprise ingrate au point de vue littéraire." It is very seldom that a *Chanson de Geste*, at least in its earlier forms, cannot be read with pleasure; the Arthurian cycle is, almost without exception, delightful; the rather unjustly decried *Romans d'Aventures*, despite their sameness, have the true charm indicated by the name of Romance. But the Mysteries, being intended strictly for representation, and requiring representation to unite and render comprehensible their action and story, are frequently very dreary to the mere reader, and the passages of actual poetical merit which they contain are relatively few. Nevertheless, the history of their development is one of the most interesting chapters of literary history, and the details of their representation form not one of the least interesting chapters in social history. Many able and laborious writers have made the different parts of these subjects their study, MM. Léon Gautier and Marius Sepet having put the final touch by at last thoroughly investigating the liturgic drama, while M. Paulin Paris, among the innumerable services which he has rendered to the literature of his country, may be allowed the credit of overthrowing the absurd and impossible theory of the Brothers Parfait about the mediæval stage arrangements, and substituting a better. M. Petit de Julleville has gathered all these things together and arranged them in orderly fashion, giving besides a complete methodic catalogue of all recorded representations and of all known Mysteries, with analyses, full bibliographical details, and all other apparatus, including occasional extracts.

The history of the Miracle play, as it is more commonly called in England, can be very shortly given, and is perhaps worth giving, as the various things said and written lately about the Ober-Ammergau performance show that a good deal of inaccuracy exists in the general ideas on the subject. There is no traceable connexion between the mediæval drama and that of the ancients, the former having, to all appearance, been the result of the natural dramatic propensities of the people, acting on the impulse given by the Church. The earliest form of the drama seems to have been a variation, and hardly a variation, on the Church service itself. Instead of extracts from the Scriptures or the Liturgy being simply read, they were, so to speak, acted by the clergy. This became in time the so-called liturgical drama, which was at first in Latin. Assuming proportions which were hardly consistent with the actual Church service, it began to exist independently, though still under the patronage, more or less direct, of the clergy, and for a time it may still have been acted within the sacred precincts. Every literary form in France early showed signs of the tendency to throw off the shackles of Latin, and to develop itself in the vernacular. At first French only put in a modest appearance here and there, as in the famous drama of the *Wise and Foolish Virgins*, where a few speeches and parts of others are in a dialect which is partly of the Langue d'Oc and partly of the Langue d'Oïl. This and some other similar things are certainly not later than the end of the eleventh century. Then in the twelfth we have a full-blown Mystery, that of *Adam*, entirely in Northern French, though with stage directions in Latin. The remains of the Mystery of this and the succeeding century are few but important, and sufficient to show the process of expansion. The play no longer clung closely to the words of Scripture. It was diversified by comic interludes, or at least scenes, which in their turn took root downward and blossomed into comedy, opera, and farce. The literary vigour of the thirteenth century and its inexhaustible romantic fancy seized on the legends of the saints and the Virgin and dramatized them. The fourteenth century has left us, besides two or three scattered pieces, a vast collection of miracles of the Virgin, containing forty different pieces, which include dramatic versions of many of the most famous mediæval stories—such as *Amis and Amiles*, *Robert the Devil*, *Barlaam and Josaphat*, *The King of Hungary's Daughter*, and *Bertha Broadfoot*. These plays are of moderate length, not averaging more than two thousand lines each; they are frequently very well written, and the story and characters fairly managed. The undertaking of their complete publication by the Old French Text Society (which has now reached the twenty-fourth play) gives an excellent opportunity of becoming acquainted with them, though several of the most interesting have been long in print in various publications, especially in the excellent *Ancien Théâtre Français* of MM. Monmerqué and Michel. After this period there came upon the Mysteries the curse of length, which destroyed mediæval literature. It was, as we have seen, in the fifteenth century that individual saints' legends were treated in ten and twenty thousand lines, and that the whole Bible history, from Genesis to the Acts, was thrown into three vast compositions, including some hundred and eighty thousand verses. Yet there is no doubt at all that spectators were found to sit out the acting of these huge works, and that they were immensely popular. No weariness on the part of their frequenters put an end to them; and, even after they were forbidden at Paris, they continued long to be popular in the provinces, forms of them having lingered on till within the last half-century, without counting the Basque *Pastorals*, which exist still.

The actors of the Mysteries were latterly, as has long been known, confraternities for the most part formed for the purpose.

* *Les Mystères.* Par L. Petit de Julleville. 2 vols. Paris: Librairie Hachette et Cie. 1880.

Earlier, they seem to have been miscellaneous volunteers, probably selected in the first place by the parish priest. That the dresses, properties, and general *mise en scène* of the theatre were also sufficiently elaborate has been generally recognized. But for a very long time a curious delusion as to the structure of the stage itself prevailed. It was thought, principally in consequence of the mention of heaven and hell as constant and specially separated parts of the stage, that this stage was arranged vertically in flats, presenting the appearance of a house with one side thrown off. This eccentric notion, if not entirely exploded, may be said to have given way before further study, not merely of stage directions, but of the occasional illustrations which the manuscripts afford. It seems pretty certain that the Mystery stage was arranged on a plan not very different from that which still, we believe, prevails at Ober-Ammergau. The extent of it was very great; it is thought that it may not infrequently have been forty or fifty yards wide and twenty or thirty deep. On this large area were dotted about the various palaces, fields, &c., which the subject required; "Hell," with a gaping dragon's mouth-door, being a fixture, Heaven nearly as much so, and Purgatory and Limbo not unfrequent. Occasionally, but rarely, the device of labels informing the spectators what each of these structures meant was resorted to. On a stage of this kind performances might go on, and did go on, for weeks together. The *journées* into which some of the existing Mysteries are divided are sometimes misleading. Thus the *Passion* of Gróban has but four; and it is needless to say that ten thousand verses, with stage business of all sorts, intervals for refreshment, and so forth, could not well be got through between sunrise and sunset. Besides, much shorter Mysteries are known to have taken many days in representation. The intervals for refreshment, just referred to, were not an unimportant feature in the performance. An actor used to come forward on the stage to suggest that his companions required rest, that they were going to get ready an even more fascinating entertainment than that which had been exhibited already, and that, if any one had a bottle of good wine and accompaniments, now was the time to discuss them. A passage on this subject, which M. Petit de Julleville gives from a fifteenth-century mystery of St. Louis, may be worth quoting:—

> Seigneurs et dames, qui ara
> La bouteille gente et jolye,
> Be bon vin de beaulne remplye,
> Et viande consequamment,
> S'y repaisse légièrement.
> Car les compaignons reposer
> Se vellent I peu, et aisier
> Pour boire. C'est la voie plus sure.
> Et dedans ugne demye heure
> On commencera de plus belle
> Quelque autre matière nouvelle,
> Qui vous plaira plus en verté
> Que celle qui faite à esté.
> Buvez, mangez, dejeunez vous.
> Je vous pry pour les joueurs tous,
> Car pas ne ferons grant espace.
> Et ne bouge nul de sa place
> Car vous n'attendez qu'l tantet.
> —Menétrier, jouez ung motet.

So the audience were set down to their Beaune and their motet in a good comfortable manner. But, if they obeyed the direction not to stir from their places, they must have been much more docile than their modern representatives.

M. Petit de Julleville promises to attack both the comic mediæval théatre, with its rich store of farce and morality, and the theatre of the Renaissance—a subject which gives the amplest scope. The workmanlike manner in which he has performed his present task affords good hope of his accomplishment of these new ones.

MARJORY.*

THERE is surely something very alarming in the title-page of the book before us, for there we read that *Marjory* is not a novel, but a study in three volumes. Now a study, in the sense in which the author seems to use the word, is, if we are not mistaken, a piece of work on a small scale, but wrought up with the greatest care, as a preparation for something far bigger and more important. In it the author or the artist tries his powers, and watches the effects that he produces. He at once gains in skill and in confidence; he not only sees what faults he must avoid, but he learns what he can do, and, encouraged by his knowledge, he spreads his wings for a longer and a higher flight. The study of a painter might cover but a few inches of paper; and at any rate it would never fill a large piece of canvas. In like manner, the study of a novelist should scarcely go beyond some fifty pages or so. If it filled a whole volume, we should at once feel that the name was ill applied. But here we have a study that fills not one volume but three, and three, moreover, each above the ordinary size. In fact, *Marjory* is a study in 1,025 pages. What size will the author's writings attain when she gets beyond her studies, and reaches her full proportions? To us, fresh as we are—fresh, do we say? jaded rather—from reading her dull and dreary story, the thought is most appalling. Does she intend, the next time she publishes, to come down upon her unhappy critic in a finished composition of thrice three volumes? May a merciful Heaven, before that evil day comes upon us, sweep us away when out on an Alpine holiday in an avalanche of snow, and put an end to our miseries! If we are destined to be overwhelmed, let it be by the hand of nature, and not by that of a novelist. Would that our author had had such an adviser as it was the good fortune of her heroine, Marjory Stanhope, to find! She, too, was a novelist; though we do not find that she called even her first story a study. She sent it up to a publisher, and the MS. was returned to her. She tried another, but she met with no better success. Being a heroine, she had, of course, a lover. He, Hugh Vivian by name, was at this time down in the world; and, to support himself, had taken to reviewing. We hope, by the way, that no "studies" came across him. Unhappy young man, brought up as he had been in the lap of fortune, and accustomed for more than twenty years to a life of luxurious indolence, they would have been too much for him. He did not, however, either hang or drown himself; and therefore we may assume that, in his time, studies in three volumes and 1,025 pages were as yet unknown. But to return to the heroine's novel. The hero read it through, pointed out to her the alterations that it needed, and, by his criticisms, succeeded in so improving it that he soon found a purchaser for it. Now, though we are very far indeed from being Mr. Hugh Vivian, yet we see plainly enough how *Marjory* might be improved. Nothing could make it an interesting story; but we feel sure that, had the author submitted her MS. to us, we might have rendered it somewhat less objectionable. We should have begun by insisting that her three volumes should be cut down to two, and when she had done this, we should then have required that the two volumes should be cut down to one. If her good-nature had not failed her, we should have gone still further and made her keep on pruning and pruning, till, so far as size went, her story might fairly be called a study. If she then, instead of throwing it into the waste-paper basket, chose to find a publisher, at all events the dull misery that she would occasion would be brought down to very small limits. The task that we should have set her would have been easy enough, for the book is so written that it can be understood by reading a few lines or so on every other page. No alteration would have been needed in the plot. All that the author had to do might have been done by a pen held crosswise. Not a word would have to be put in to take up the place of the thousands that ought to be struck out. All that is needed is that the book should have the same treatment applied to it as is alternately applied to a balloon. The sand must be thrown out and the gas allowed to escape. By the end of the day the bulk is found to have been prodigiously reduced, while the worth of the materials remains the same.

First of all the author should throw overboard all her descriptions of nature and art. This, we fear, she would do at the cost of a great pang, for it is clear that on these parts of her writings, like most of her fellow-novelists, she greatly prides herself. When, we may well ask, will readers get sickened with these ridiculous and wearisome accounts of the changes in the weather? The descriptions we have in *Marjory* of the effects of light and shade at the different seasons would, we verily believe, go a good way towards filling half a volume. Silly as these descriptions are in themselves, they are rendered still sillier by the author's misuse of words. She writes of "the meridian of the burning afternoon." She makes what she calls the "goldening corn" of late summer be seen at the very time when "the woods were heavy with foliage at its prime" (*sic*). She writes of "rains universalising mud and discomfort," and of grey clouds that were timid, because "the sky in which those grey clouds floated was of a still, dark blue, silent, grand." A thunderstorm, of course, is brought in. In the storm is seen a flash of lightning, which seems astonishing to the author apparently for no other reason than because it was like most other flashes. "'Did you see the form of that, Hugh?' said Lady Thorne. 'It was a complete zigzag.'" Like other writers who must needs be most minute in their accounts of the coming of spring and summer, the author blunders. Thus, she makes the syringa in flower in the second week of May. Had she said the second week in June she would even then have made it come out none too late. Her tediousness of minute description is not confined to the face of the earth and of the sky. It is to be found in every part of her story. Thus in the first chapter she introduces an elderly clergyman and his invalid wife, who, if we are not mistaken, never appear again on the scene. We are told that they had an early luncheon. This in itself was neither improbable nor important. Had nothing more been said about it we might have passed it by unnoticed. But the author thinks that it is the duty of a writer to bring the whole scene before the minds of her readers, as if they had beheld it with their own eyes. So she tells them that the table at which they lunched was square, and stood in the centre of the room. It was adorned, moreover, by a pink cotton cloth, on which was a tray. When the lunch was finished, there were to be seen on this tray "remnants of cold beef which had formed the clergyman's repast, and a bone, sole relic of a mutton chop cooked for the invalid." The reader who enjoys such an account as this might surely complain with some justice that too much is told or too little. Did the clergyman take mustard with his cold beef, he might, with a very natural curiosity, inquire? and had he any pickles? What was the invalid's drink? Was it porter or sherry that she was ordered by the family doctor? Not very many pages further on the heroine has a bath. A faithful old servant "opened a door in the wall"—a very remarkable door, by the way, seeing that it was neither in the floor nor the

* *Marjory: a Study.* In 3 vols. By the Author of "James Gordon's Wife." London: Wyman & Sons. 1880.

ceiling—"and revealed a little bath-room, with taps of hot and cold water, and every convenience for their use." What are the conveniences for the use of taps? Here again we are told too much or too little. In a third passage in the same volume we find the heroine "nervously propitiating a teapot." Of this, indeed, we can make nothing, for she gets beyond our knowledge, and possibly beyond her own. In one or two passages where she wanders from her descriptions of beef, bones, baths, and teapots, she certainly makes great blunders. Thus she makes her hero ask the heroine whether she knows "the old song," and thereupon he quotes a well-known song of Mr. Kingsley's. In another passage, when quoting some words from one of the Gospels, she says:—"Taking time as a whole, it was not so very long ago! eighteen hundred years and odd—less than twice the years since our Norman Conquest." We should be curious to know what book of chronology it is that she follows. We remember to have heard a lecturer begin his discourse by saying, "Archbishop Usher places the foundation of the world 4,004 years before Christ. I myself am inclined to place it 4,002." But his daring innovation was nothing to our author's, who certainly places the Norman Conquest more than a hundred years earlier than the ordinary historian.

As *Marjory* is written by a woman, it is almost needless to say that there is in it some very curious law. The heroine's brother is a victim to it; and, instead of living to be a famous artist, he is killed off by the lawyers in early manhood. We were, we must confess, so glad to see ourselves fairly rid of one of the author's two heroes that in our joy at our escape from him we hardly noticed the dulness of the description of his dying. He had been left an orphan, and had been brought up by a strict grandmother. The old lady died, and bequeathed him, not a fortune, but a debt. The solicitors to whom the debt was due were not, under the circumstances, too exacting. "I have signed," the brother told his sister, "an agreement with Grove and Carter; they were very kind; there will be no undue pressure." We have seen the last, we trust, of the old attorney of the novel who was ready to skin a flint. Henceforth we shall only meet with men like Messrs. Grove and Carter, who, when a grandmother bequeaths her grandson nothing but the payment of a debt, nevertheless use no undue pressure to enforce it. However, in spite of their considerate kindness, the burden is too much for the poor fellow, and he sinks beneath it and dies. The hero is not much better treated. It was from a great-grandmother he suffered. He was, when the story opens, to all appearance, the heir to a fine fortune. We first come across him when he is on a fine horse, "a thorough-bred, groomed to perfection, his coat shining, his tail of strictly orthodox proportions—the bit, stirrup-irons, and all other appointments in character." We next see him in evening dress, and in this he is equally admirable. We then see him in a towering passion with a lazy groom, but though he so far forgets himself as to swear, yet we must allow that he swears like the heir to a fine ancestral estate. Later on we see him chief butterfly among a party of butterflies, and there we learn that "he well understood the art of fitting wings to an idle hour." The metaphor seems a little mixed, but the hero is as much as ever the object of our admiration. On a sudden his father dies and ruin bursts upon the unhappy son. His great-grandmother had been a great lady, and on her his great-grandfather had been forced to make a heavy settlement. The ungrateful old woman at her death left her settlement away from the family. Her husband and her son, moreover, were extravagant men, and the estates were all mortgaged. When Hugh came into possession he was almost as badly off as the heroine's brother. However, he was fortunate in this, that, though his father had died deep in debt, he had not been cruel enough to bequeath his debt to his son. The only one who had any money was the heroine, and her fortune amounted to but fifty pounds a year. Moreover, to the will by which she inherited this property her grandmother had added a codicil to the effect that, if she gave any of her money to her brother, the legacy was to be transferred to an asylum for the orphans of British seamen.

Things take a very bad turn indeed; the heroine's brother becomes a clerk in a bank, and so does the hero. The brother, as we have said, dies, and the hero takes to reviewing. For a time he is suspected of being a forger and an atheist, but the heroine remains faithful to him. In due course both his innocence and his orthodoxy are established beyond doubt. Nevertheless it is not easy to see how the young people, if they marry, are to live, for their earnings, when added to the heroine's fifty pounds a year, do not amount to much. However, an old gentleman suddenly dies in Russia, who, it turns out, had had "a long-cherished idea; that of making Hugh Vivian his heir." The hero in a moment finds himself in possession of a fine old estate and 50,000*l.* a year. In describing him in the midst of all his joy the author forgets to add that henceforth it was not to be his unhappy lot to have to review silly novels. How happy might another critic be, as well as Hugh Vivian, if there were a second rich old gentleman in Russia, with a long-cherished idea of making some one else his heir, and lying now at the point of death. To be free from the task of reading such a "study" as *Marjory*, and from the awful apprehension of what the "study" may be leading to, would double the worth of the fortune and the estate.

FOREIGN COUNTRIES.—AUSTRIA-HUNGARY, PERU.*

THE form of compilation and publication in small volumes presenting a series of special monographs by different writers treating their allotted topics with some approach to uniformity of method, has lately come into fashion. It was first applied to subjects of critical literary history and biography, ancient and foreign "classics," and "English men of letters." There seems no objection to applying it likewise to the exposition of physical and political geography, which naturally falls into distinct local divisions. These divisions are more capable, indeed, of a certain formal regularity in the order of statement than discussions of the lives, characters, and writings of famous poets and philosophers. It is much easier to set forth the statistical conditions of a country within a given number of neat little pages, arranged in so many chapters and sectional paragraphs, than to perform a similar feat with the productions of an individual genius. Guide-books, and all manner of handbooks and compact articles in encyclopædias, can easily be supplied by diligent research and correct mechanical editorship for every recognized territory and population on the earth's surface. Their utility, too, will often seem to be more obvious and unquestionable than that of compendious handbooks to an acquaintance with the heroes, saints, and sages of past times. The series of "Foreign Countries and British Colonies" has begun very fairly under Mr. F. S. Pulling's direction. Its collective title may indeed be lacking in precision. We see that the list of volumes thus far announced as in hand does not include the British Indian dominion, which is, for instance, neither a colony nor a foreign State. But the plan is one that should not be difficult to execute, since there are many existing models in the separate divisions of works embracing the whole of terrestrial geography.

The subject of Mr. David Kay's little volume should command the attention of thoughtful and inquiring persons who really try to understand the politics of Europe. The slightest consideration will show that the condition of Austria-Hungary, its constitution, resources, and tendencies, must be of great importance to the general welfare of Europe. It may, indeed, be a matter of opinion whether so much could have been justly said a quarter of a century ago on behalf of the Austrian Empire as it then was—embarrassed by false and untenable relations to Italy, to Hungary, and to the Germanic Confederation. But even at that time it was generally admitted that an essential security for the peace of the Continent lay in the stability of the Hapsburg rule over provinces containing the dislocated and confused fragments of races prone to mutual hostility, which might otherwise be seduced by a dangerous foreign patronage. This maxim has lost none of its force since the Crimean War; and its truth is now more freely recognized, owing to the vastly improved constitution of the Austrian monarchy, its reconciliation with Magyar nationality, its release as well from burdensome German responsibilities as from a perilous and discreditable Italian position, and its display of a liberal and equitable spirit in its internal government. A manual of the affairs of the dual State reigned over by the Emperor-King Francis Joseph I. should, therefore, be profitable and agreeable reading for the sake of its subject-matter, if it were so written as to be readable. Mr. David Kay, for his part, though he expressly points out the striking contrast between the old and the new condition of Austria-Hungary, indulges in no kind of sentimental enthusiasm on the subject. In a brief historical sketch he notices the chief events that have led to the present political reorganization, first, of Austria and the Western or Cis-Leithan provinces, in 1861; and, secondly, in 1867, of the Hungarian kingdom, with its dependencies. The legislative and administrative reforms of this period are simply enumerated, and it would perhaps have taken too much space to describe them clearly. But we should have preferred a fuller treatment of this part of the subject, for which the needful space might have been conveniently saved by omitting superfluous details in the other chapters. The author seems to have an inordinate predilection for arithmetical statistics, which too often consist of mere crude masses of figures. In dealing with the census, which occupies seven pages of Chapter IV., it was surely not worth while to set forth, as the actuary of a life assurance office might do, the exact number of males and females in existence at each successive period of life. It is, however, interesting and important to know the relative proportions of the people of different races, and their local distribution in the Empire. Mr. Kay has of course not failed to give us all the desirable information of this sort; but he has likewise provided rather too much of that which is unserviceable and unattractive. His work is one that may be used in the way of reference, but that cannot be read with pleasure or intellectual profit.

Mr. Clements Markham's treatise on "Peru" we can praise with less reservation. It is a very inviting little book, and a really pleasant one to read; for it is not crammed with a congestion of non-essential facts, but exhibits, in due relief and prominence, those which are characteristic of the main features of his subject. A better performance in this line we have seldom met with. The author has, to be sure, had a less complex and involved topic to deal with than that committed to the hands of Mr. David Kay. Peru is a single country, though one of im-

* *Foreign Countries and British Colonies.* Edited by F. S. Pulling, M.A., Exeter College, Oxford. *Austria-Hungary.* By David Kay, F.R.G.S. *Peru.* By Clements R. Markham, C.B. London: Sampson Low & Co.

mense diversities in its physical conditions and in its social and historical experiences; whereas Austria-Hungary is a congeries of many diverse territorial, ethnological, and political bodies, with no common organic unity of nature. But Mr. Markham's firm and light handling of his theme deserves a good share of credit for the satisfactory result. He seems equally conversant with the physical geography, the natural history and botany, of this singular country, with its architectural antiquities, which are still more wonderful, and with its economic and administrative prospects. At least he manages with equal success to convey a pretty clear idea of all these different matters to the reader; and we are not aware of any mistake or serious defect in his account of them. It would have been premature for him to speculate on the effects that may shortly follow the issue of the recent war between Peru and Chili. But we observe that Mr. Markham advises the Peruvian Republic to assign all its guano and nitrate of soda to the bondholders, and so to get rid at once of the public endowment and the public debt, and to start afresh, like a fairly certificated bankrupt, financially free and empty-handed. This suggestion may or may not be deemed worthy of practical consideration, but it at least shows that the author does not think the actual position of that too adventurous commonwealth entirely desperate. On the whole he is of opinion that, since the era of Peruvian independence, fifty-six years ago, there has been some degree of real progress, not only in material prosperity and in works of public utility, only too hastily carried on, but also in social civilization and the enlightenment of the people. We should be glad to know that it is so; and at any rate it is pleasant to read Mr. Markham's personal commendations of several distinguished Peruvians, the scholars and authors especially. The works of the politicians and administrators must speak for themselves.

The chapter describing the natural conditions of Peru, dividing the country into three regions, the Coast, the Sierra, and the Montana, is a masterly piece of exposition. In each region separately, the mountains, plains, and valleys, the general configuration, altitude, and climate, the river-system, the flora and fauna, are precisely indicated; and the subdivisions of each region are marked with reference to these peculiar features. It is a complete little scientific essay, leaving an intelligible and consistent impression both of the whole and the parts. Mr. Markham next proceeds to give some account of the Yncas and other ancient nations who inhabited Peru before the Spanish conquest; and then follows a description of the principal remains of their big and laborious buildings, their aqueducts, tanks, and artificial terraces for cultivation. The reader may be led to seek a more ample and minute acquaintance with these marvellous constructions in the pages of Squier and Hutchinson, and of several native writers in Spanish whose works have been translated. Our curiosity is aroused, not only with regard to the Yncas, the imperial nation which inhabited the upland midland region of Cuzco, but also concerning the people of Chimu, in the northern part of the coast, about Truxillo. These are called Yuncas, and must be entirely distinguished from Yncas or Incas; but they would appear, from the architectural remains, to have been a powerful, wealthy, and ingenious nation. Mr. Markham abstains from those discussions of problematical ethnology which are so tempting upon this ground, amidst the striking proofs—monumental, linguistic, and traditional—that diverse richly-endowed nations, branches of the Quichua-Aymara race, had grown there to a high degree of independent civilization.

The modern and quite recent public works of the Republic are described by Mr. Markham as "beginning to vie with the deeds of the Yncas." He approves of all the short coast railroads which connect the seaports of Payta, Lambayeque, Pacasmayu, Truxillo and Salaverry, Callao, Pisco, Mollendo, Ilo, Arica, and Iquique with towns or productive agricultural districts, or with those yielding nitrate of soda for export trade. But the ambitious and, as he says, "stupendous" works of this kind over the western and central Cordillera ranges seem to have been prematurely undertaken by President Balta's Government ten or twelve years ago. The line from Callao and Lima to Oroya, in the lofty plain of Xauxa, ascends to a height of 15,645 feet, with sixty-three tunnels, many huge cuttings, and costly viaducts and embankments, at an expense already reaching 4,625,000*l.* The line from Arequipa to Puno, on the shore of Lake Titicaca, which has cost hitherto 4,346,000*l.*, presented fewer engineering difficulties, but is 232 miles long. It is more than doubtful whether these railroads will soon become remunerative. The total outlay for the Peruvian railway system, when completed, with a length of 2,000 miles, will be 37,500,000*l.* Such an exhibition of constructive enterprise, in proportion to the size and population of the State, is scarcely equalled by any of those British colonies the situation of which may be compared with that of Peru. It is true that British private and joint-stock undertakings, at the ports of Callao and Pisco, and in the navigation of inland rivers, leading eastward to the Amazon and the Atlantic, have much improved the facilities of commerce. With peace for ten years, and with ordinary prudence and capacity in its government—if such things were possible in Spanish America—the prosperity of Peru ought to be as great as anything that the New World has yet beheld.

CHRISTMAS BOOKS

I.

THE Christmas books which have as yet reached us are more remarkable for quantity than for quality. A flock of brilliant cloth covers, a crowd of woodcuts, is the general impression left on the weary eye and brain. A fable after the manner of Æsop's boys and frogs might be written on Christmas books. They are fun to the children for whom they are manufactured, but they are a serious matter to the critic, who occupies the place of the frogs in this simple apologue. As the weeks go on, however, and as publishers bring out their really serious attempts at decorative books, the reviewer is a prey to mingled envy and regret. He regrets the good Dutch paper that is too often spoiled by bad illustrations, he covets the etchings which illustrate the more successful volumes. Messrs. Macmillan have already put forth a volume of etchings, *The Granta and the Cam, from Byron's Pool to Ely* (drawn and etched by R. Farren), which redeems the faults of many grievous Christmas books. Here is a collection of etchings which are a pure delight to every lover of river scenery, and which must be an especial joy to every Cambridge man. The plates are beautifully printed on thick rough paper, and, as a rule, they are cleverly "drawn and etched." We do not gather from these words on the title-page that Mr. Farren etched his designs on the copper from nature, as is the manner of Mr. Whistler and Mr. Seymour Haden. He seems first to have made drawings, and then to have translated these on to the copper. His attempts are not all of equal merit. In "Byron's Pool" the attempt to draw the foaming waters of the lasher results in a series of symmetrical bubbles, big and little. In "Chaucer's Mill," too, we are not satisfied with the drawing of still water; and the shore lines are coarsely indicated in "Grantchester Meadows," where the fisherman struggling with a pike or chub is armed with a rod like a weaver's beam. But in his studies of buildings Mr. Farren is far more fortunate; and we do not know how to praise him sufficiently for his beautiful and melancholy "Queen's Bridge" and his "Magdalene College." These are etchings worthy of being framed and hung where they can always be in view. Perhaps next year Mr. Farren may try to do for Isis and "the stripling Thames" what he has done for Granta and Cam. He is not unworthy to illustrate *The Scholar Gipsy*.

Messrs. Dalziel's *Bible Gallery* is bound in vellum and leatherette, and lettered in red and gold. The hinges of the binding, however, are scarcely strong enough for the work they have to do. What is leatherette? We greatly prefer leather when durability is required. The book contains sixty-nine woodcuts of Biblical subjects from designs by Sir F. Leighton, Mr. Watts, Mr. Sandys, Mr. Simeon Solomon, Mr. E. G. Dalziel, Mr. T. Dalziel, Mr. Burne Jones, and other eminent artists. In the President's "Cain and Abel," the foreshortened body of the slain brother is powerfully drawn. Cain shows a remorse out of keeping with the cool impudence which he presently exhibited. That Noah was in the "iron stage" of culture we gather from the design of his adze in Mr. Watts's "Building of the Ark." Mr. Dalziel's "Deluge" is very like a Scotch picnic on a "saft" day. The same artist rather daringly copes with "The Destruction of Sodom." Mr. Simeon Solomon's "Melchizedek Blessing Abraham" misses, in the woodcut, the artist's best gift, the rendering of textures. Indeed we seriously miss in each woodcut the peculiarities of each artist's manner. There is originality in Sir F. Leighton's "Samson at the Mill," but in scarcely any other example could we have guessed the artist from the style of the woodcut. In almost all the other designs, the individuality of the painter is lost in a kind of "Sunday" quality of work, and even Mr. Burne Jones's ladies are not recognizable. We must except from this censure the President's drawing of Samson slaying the lion, and his most powerful sketch of Samson carrying the gates of Gaza. A glance at the gates of Shalmanezer in the British Museum will show the nature of the Hebrew giant's exploit. We miss Mr. Rivière's "Daniel in the Lion's Den."

Jack and Jill: a Village Story (Louisa M. Alcott. Sampson Low and Co.)—It is hardly necessary to say much about Miss Alcott's new story. Her name is a guarantee that we shall find in it nice healthy-minded boys and girls whose virtue is often far above their grammar. As might be expected from the title, Jack and Jill are two little friends who get a terrible fall while "coasting," but undergo an immense amount of petting all the time they are getting well. English readers lay down these and similar books with the feeling that American days must be at least ten times as long as ours, and American mothers at least twenty times as long-suffering. They also have curious sensations as to the free-and-easy terms on which everybody lives; but here we tread on grave social problems, and must stop.

The long story in *Aunt Judy's Christmas Annual* (George Bell and Sons), by the author of the *Rose Garden*, is called "Princess Alethea," and belongs to what may be labelled "stepmother literature," which forms a leading feature of the Christmas books this year. Surely children will get sadly puzzled when they come fresh from the cruel stepmother of Grimm and Hans Andersen, and all the other fairy stories, to the wise and patient lady of modern tales, who is always in the right, and who submits meekly to any amount of bullying on the part of her husband's children. Apart from this, "Princess Alethea" is very natural and sensible, and worthy of taking a prominent rank among the well-chosen scraps that go to make up this Annual. There may be children,

however, who prefer *märchen* like the Irish "Black Thief," in which the stepmother is neither so good nor so fortunate.

Yellow Cap; and other Fairy Stories for Children (Julian Hawthorne. Longmans and Co.)—Mr. Julian Hawthorne has here undertaken a task beyond his power, and, as far as we know, beyond the power of any one living, for the art of writing fairy stories died with Hans Andersen. The idea of *Yellow Cap* is not a new one, being merely that of a young man who is ready to barter love for wealth and power, and who finds out his mistake in time. The story, however, would not have been the worse for that, had the conception been well worked out; but Mr. Hawthorne has tried to satirize modern manners and customs, and the result is unsuccessful. The second story of "Rumpty Dudget" is simpler and better; but in all of them there is more love-making than is desirable for children to read about.

Nimpo's Troubles (Olive Thorne Miller. Griffith and Farran).—This is a capital history of the adventures of some most troublesome children, who were left by their parents to board out for a month, while they themselves went to a distant city. The experience, though very good for the children, must have been rather an expensive one in many ways, not only on account of the number of clothes belonging to herself and her mother that Nimpo contrived to spoil, but also from the number of articles which she obtained from her father's store. Of the illustrations the less said the better, both in this and in the other stories that we have noticed. It is a pity that bad pictures should be considered necessary, if good ones cannot be had.

Two Rose Trees: the Adventures of Twin Sisters (Mrs. Minnie Douglas. Griffith and Farran).—We have always thought that it must be rather dull to be a twin, and the *Two Rose Trees* confirms this impression. Two amiable infants go about (*vide* the illustrations) with their arms round each other's very large waists; they both speak at once, saying exactly the same things, and share every thought. They have no moral infirmities of any sort, and end by being endowed with all good things.

Right and Wrong (Griffith and Farran).—This is the history of another pair of twins; only here, in order to point the necessary moral, one gives way to her little tempers, while the other resists them. Instead of the parents sending the naughty twin to school, or taking other violent measures to break her in, she is reasoned with at some length by her father and mother, a lady who tells her little girl that "the acquisition of knowledge is indeed, my dear child, one of the highest gratifications of the human mind." The twins were blest in their new companion. "Miss Simpson was a very beautiful little girl. She had conquered her faults, and therefore was very amiable. She had attended to instruction, and therefore was very clever." In spite of association with this gifted creature, Rosa does not mend her ways, but ends as untidily as she began.

Peacock Alley (The Rev. Frederick Langbridge. Hatchards).—Peacock Alley was the haunt of various low characters, and the home of a little boy and girl who are the hero and heroine of this story. They run away just as their father is on the point of being arrested for murder. The girl loses herself with her kitten, is picked up by the manager of a penny theatre, and, with three hours' preparation, makes an unexampled success on the boards. After two months of this life, which she thoroughly enjoys, it is a surprise to find her becoming a domestic character on the first opportunity.

Chryssie's Hero (Annette Lyster. S.P.C.K.)—Chryssie is the very small peg on which her "hero" hangs. He is an Irish boy, brought up by his old great-uncle, and on the death of the latter—when Frank, the hero, is sixteen—he is sent to live with his mother's brother, a most successful and most repulsive crammer. The life is a terrible one, as the only diversion the six boys have is the surreptitious one of getting out at night and going to some billiard-rooms at Woolwich. However, in one way or another, they are all released in time, when they immediately turn and rend their tutor by spreading reports of his treatment of them. Miss Lyster has broken quite new ground, for which her readers will be grateful to her.

Beatrice Melton's Discipline (Maude Jeanne Franc. Sampson Low and Co.)—*Beatrice Melton's Discipline* is not so much a story as a maunder without beginning or end, or very much middle. It contains a great many characters, all of whom, if not religious to start with, ultimately become so. The heroine and autobiographer does not seem so intimately acquainted with her relations' Christian names as she is with their spiritual prospects; for in one page her brother is spoken of as "Geoffrey" and in another as "Godfrey." Mr. Baraud appears on the scene as "Mr. Barnard"; while even Beatrice's own name is sometimes converted into "Bertie." Has Miss Franc herself quailed before the task of reading her own story in the proof-sheets?

The Girl's Own Annual ("Leisure Hour" Office).—This is a large and weighty book, containing most varied matter. There are several long stories, the two most important of which are "Zara; or, My Granddaughter's Money," and "More than Coronets," by Mrs. Linnæus Banks. There are, besides, endless shorter tales, adorned with pictures of young people in sentimental attitudes; but the most curious and instructive part of the whole is perhaps the columns devoted to recipes for enabling girls to keep their beauty, and answers to a singular race of correspondents who are ignorant how "beau" should be pronounced, and inquire if Vandyke and Rubens are poets.

Little Britain (Washington Irving. Illustrated by C. O. Murray. Sampson Low and Co.)—After the terrible pictures we have been doomed to contemplate, it is a real pleasure to meet with these illustrations which Mr. C. O. Murray has made to Washington Irving's book. They are not only clever in conception, but they are well and carefully executed, and tell their own stories with much humour. The small architectural bits are particularly good.

Captain Eva (Kathleen Knox. S. P. C. K.)—Captain Eva was the name given to herself by a very singular little girl who, after having gone through the Indian Mutiny as an infant, would obey nothing but what she called martial law, and addressed her father as "Colonel." The story is certainly original, and so is the Captain's school, which seems to have offered every luxury of the season.

Tasmanian Friends and Foes (Louisa Anne Meredith. Marcus Ward and Co.) is a sketch of the manners and customs of the principal birds, animals, and fishes of Tasmania. Its style is colloquial, as it is supposed to be compiled by a young colonial girl for the benefit of her English cousin. In this way a great deal of information is very pleasantly conveyed; but we are sorry to say that in this instance, as in many others, the illustrations are not equal to the letterpress.

Bertie and his Sister (Alfred Engelbach. S. P. C. K.)—This is not a very favourable specimen of a child's book. The moral, which lies on the surface, is that of the sin of procrastination; but the author has attempted to put too much incident into the story, and has failed to make it natural.

The Heir of Kilfinnan (W. H. G. Kingston. Sampson Low and Co.)—The "Heir of Kilfinnan" refers, of course, not to the obvious heir, who dies, but to his cousin, who appears throughout the book—first as a fisher-boy, and then as a midshipman. He is invested with his true rank just in time to save the fine feelings of the supposed heiress, his cousin Lady Nora, with whom he is in love, and who has decided views about *mésalliances*. There is plenty of excitement in the book, and when the characters are not fighting at sea, they are being besieged on land.

A Tearful Victory (Darley Dale. S. P. C. K.) is another story of a stepmother and some very well drawn but most unbearable children over whom she had to rule. Of course in the end they become devoted to her, but the preliminary process was both long and trying. The book is well written, and avoids preaching.

The Belfry of St. Jude (Esmé Stuart. S. P. C. K.)—Miss Stuart has a great gift for writing stories which are simple and yet out of the common, and interesting to children as well as to their elders. The Belfry of St. Jude was an old tower in a French town, which had become a dwelling-house, and held two families, whose lives became closely connected. There are enough incidents to preserve the tale from the tameness which is so often the blot of this kind of literature.

Pansie's Flour Bin (Author of "St. Olave's." Macmillan and Co.) *Pansie's Flour Bin* begins very well, but degenerates about the middle into a poor copy of *Alice in Wonderland*.

The House on the Bridge; and other Tales (C. E. Bowen. Griffith and Farran).—These stories are well chosen and interesting. "Scrap's Mission" is a pathetic tale about a dog, while "Mary Raymond's Promise" tells of the adventures that befell a little girl in her efforts to get back to her father. The book has no false sentiment, and is very good reading for children.

GERMAN LITERATURE.

AFTER twenty-seven years Jakob Burckhardt's survey of the age of Constantine (1) reappears, with important additions and alterations, as substantially a new work. Few eras, it need hardly be said, are more interesting for the influence they have exercised on the destinies of the world; few are less attractive with respect to the characters of those by whom these mighty issues were determined. In no period equally eventful, perhaps, has creative genius, whether of the imaginative or the practical order, been at so low an ebb. Among the crowd of mediocrities, two remarkable figures stand forth—Constantine, a prosaic Augustus, and Athanasius, the first type of the ecclesiastical statesman in the Western world. Herr Burckhardt has made hardly any attempt to depict these remarkable persons, and his work will disappoint all who expect the animation and picturesqueness of a history. It is rather an essay on a phase of culture, like the author's well-known work on the Renaissance; and from this point of view there is hardly a page that is not agreeable and instructive. The momentous revolution in the religion of the Empire is of course by far the most remarkable phenomenon of the time, and this may be approached either on the side of the progress of the new faith or of the decay of the old. Herr Burckhardt has preferred the latter. In three very interesting chapters he sketches, first, the *theocrasia*, or general mixing up of all the deities of the various constituents of the Roman Empire into one uncouth Pantheon; secondly, the remarkable reaction of the second and third centuries, quite independently of Christian influences, in the direction of the doctrine of personal immortality, and of the wild and mystical ideas, akin to modern Spiritualism, which it brought in its train; lastly, the general growth of barbarism and perversion of the standards of antique taste, even in such matters as costume and pronunciation.

(1) *Die Zeit Constantin's des Grossen.* Von Jakob Burckhardt. Zweite verbesserte und vermehrte Auflage. Leipzig: Seemann. London: Williams & Norgate.

To these causes must be added the failure of Diocletian's persecution, a step on the part of that generally wise and just ruler whose causes still remain obscure, notwithstanding the careful investigation of so many modern writers. Herr Burckhardt has devoted a special chapter to it, and is evidently, and with reason, more interested in Diocletian than in his nominal hero Constantine. The latter was indeed a warrior and a statesman, but such a one as most ages can produce. Diocletian is a problem from every point of view—in his astonishing rise, his wonderfully dramatic abdication, his military triumphs without military genius, his remarkable ascendency over fierce and cultivated natures, the contrast between his ordinary wisdom and such questionable measures as the persecution of the Christians and the attempt to fix the price of commodities; most of all, in the singular alliance of homely, practical sagacity with the far-fetched ingenuity of a political machinery far too refined to work. The last chapter sketches Constantine's almost entirely Orientalized court, administration, and army.

There was undoubtedly room for such a biography of Blücher as Dr. Wigger (2) has given us—a work complete in itself, though only enlarged from a section of his exhaustive history of Blücher's family. No independent biography of much pretension previously existed. Varnhagen's is indeed classical, like all his biographies; but it is only one member of a collection of lives, and is not based upon an adequate review of documentary evidence. Much matter of importance—as, for instance, Baron Müffling's autobiography—has been published since Varnhagen wrote, and his narrative is devoid of that authority in military matters which Dr. Wigger's has received from the express approbation of the greatest of living strategists, Marshal Von Moltke. The Marshal's imprimatur alone would denote that it is written from a strictly national point of view; but it is creditably free from the narrow patriotism and unseemly arrogance which too frequently characterize German histories of German triumphs. If there is any exception to the general impartiality and candour of the narrative, it is in the claims preferred on behalf of the Prussians to the principal share in the victory at Waterloo—a controversy in which Englishmen can well afford to imitate the proud reticence of Wellington. No one, however, can read the book without a hearty admiration for the stout old Marshal, whose faults served him almost as well as his finer qualities. A higher intellectual organization would have made him more circumspect, and would have tempered the impetuosity and impaired the tenacity to which, more than to his military abilities, he was indebted for his success. In temperament he greatly resembled Nelson, but he had scarcely more of Nelson's genius as a tactician than of Wellington's genius as an administrator.

The fifteenth volume of Dr. Georg Weber's Universal History (3) is devoted to the history of the nineteenth century, between 1830 and 1851. It is divided into two parts, the first appropriately entitled "Between Two Revolutions," the second detailing the revolutionary and reactionary movements of 1848 and the three following years. The volume is prefaced by a review of the intellectual and social condition of Europe at the opening of the eventful period delineated, and closed by a summary of the literature, science, and art of the age down to the present time. The execution is careful and conscientious throughout, allowance being made for the disproportionate prominence accorded to German affairs, and the multitude of topics inevitably treated at second hand. Thus, for instance, Anselm Feuerbach, one of many excellent German historical painters, is noticed at sixty times the length accorded to perhaps the greatest landscape painter the world has seen, who happens to be an Englishman; and the character of each notice shows that Dr. Weber has no first-hand acquaintance with the subject of either.

The ethnological affinities of the Roumanian nation (4) constitute a problem difficult in itself, and still more perplexed by reason of the strong party spirit imparted into the investigation. The Roumans themselves naturally wish to pass for the lineal descendants of the Roman colonists settled in Dacia by Trajan. It has, however, been frequently contended of late, especially by Hungarian writers, that the Latin settlers left no lineal representatives, and that the existing Roumans are immigrants from Macedonia, where a large "Vlach" population is found at this day. Herr Pic, evidently a very competent authority, is entirely adverse to this theory; but his own notion that the Roumans are in the main Romanized Slavonians will be hardly more acceptable to their patriotic vanity. In fact, from the statesman's point of view, the generally pernicious maxim "that the truth is what man troweth" is perfectly applicable to the historical side of the question of nationalities.

Christian Kunth (5), though better known on his friends' and pupils' account than his own, was nevertheless an excellent man, whose biography is well worthy of the preservation to which it is indebted for the pious care of his grandsons. He was an admirable type of the Prussian bureaucrat of the old school—conscientious, methodical, laborious, and patriotic. In his younger days he was tutor to the brothers Humboldt, whose regard he retained throughout his life; at a later period, engaged in the Prussian Civil Service, and immersed in financial and economical business, he formed a close friendship with Stein, and corresponded with him for many years. Stein's letters have, unfortunately, disappeared. He took an honourable, although a subordinate, rank among the restorers of Prussian prosperity after the overthrow Prussia received from Napoleon; but his usefulness seems to have been impaired, and his official position compromised, by misunderstandings with his superiors and by his hypochondriacal temper. An appendix contains, with other matter, an interesting report, dated 1817, on the question of Protection and Free-trade, pronouncing in favour of the latter.

Herr Hübbe-Schleiden (6) is an advocate of what would be called in England an Imperial policy. He wishes his countrymen to become a great colonizing nation. The objection is obvious that all the parts of the earth adapted for European occupation are already colonized by other nations, and that the tardy German is in the position of the poet in Schiller's ballad. Herr Schleiden replies by distinguishing between settlements and factories. He would have his countrymen establish themselves at suitable points of naturally fertile but barbarous countries, and gradually educate the natives to steady industry and improved methods of production, receiving the fruits of their labour, and supplying them with German products. This seems the only feasible method of developing the resources of regions too populous or too unhealthy for European colonization, and it is remarkable that it should be simultaneously and independently recommended by the Italian traveller D'Albertis as the best way of dealing with New Guinea. The systematic pursuit of such a policy, however, would require more concentration of purpose than can be expected from a State agitated by internal dissensions, and harassed by apprehensions of her neighbours.

Edward von Hartmann's (7) latest contribution to the philosophy of pessimism is an endeavour to provide it with a scientific basis by putting it upon the broad shoulders of Immanuel Kant. Kant was certainly not a Utopian or a highly sentimental theorist; but it is more than doubtful whether he would have assented to the proposition that existence is necessarily an evil. Even this dogma, however, which seems to be all that Hartmann contends for, is very far from amounting to a thoroughgoing pessimism. Such a view would admit of no remedy for human ills short of absolute annihilation; whereas the serenity and self-mastery which Hartmann promises on condition of accepting his lugubrious doctrines would insure a degree of felicity enough for any philosopher less exacting than Fourier, who would be satisfied with nothing short of turning the ocean into lemonade. In fact, Hartmann travels from pessimistic premisses to an optimistic conclusion; and the argument of his book is so far justified that he has himself insensibly substituted for the genuine Buddhism of Schopenhauer a modified Stoicism, highly ethical and respectable, but which would have attracted comparatively little attention if its first appearance had not been in masquerade.

Dr. Eugen von Schmidt (8) criticizes what he considers the immoderate importance attached by Professor Max Müller to forms of expression as originators of religious ideas, and to etymology as a clue to the signification of myths. His own view is substantially the old one, that primitive religion begins with the deification of natural forces and visible objects.

Theogony and Astronomy, by Anton Krichenbauer (9), is an example of the now almost exploded system of interpretation which explains all religious beliefs and all poetical allusions as astronomical symbols. To Herr Krichenbauer, the Homeric poems are a sidereal, instead of a solar, myth; the scene of the Iliad is laid in Cilicia; the Achivi are goats (αἶγες), in compliment to Capricorn. Egyptian, Assyrian, and Persian mythologies are dealt with in a similar fashion. Herr Krichenbauer is always ingenious, and his erudition is so abundant that he could well afford to exchange some of it for a little common sense.

There is erudition enough, and sense enough, in H. Steinthal's minor writings (10), but they are too abstruse to be read by any but the most accomplished philologists.

Herr Ludwig Noiré (11) has a remarkable faculty for presenting mere truisms in the guise of profound discoveries. This endowment is admirably displayed in his essay on the genesis of prehistoric tools, the matter of which is generally only open to criticism on the ground of superfluity, but whose style might have afforded a model to the author of *Typical Developments*. It is provoking to be informed at the end of a long disquisition on the question how tools *must* have been made, that recent discoveries have shown how they *were* made; and that the writer could have told us from the first, had he not considered it more dignified and becoming to resort to "the deductive method."

The organization of the German book trade (12) must be complicated indeed, seeing that Herr Schürmann finds it necessary to devote three volumes to the subject. The first, the only one as yet published, is mainly historical, detailing the legislative measures adopted from time to time, the peculiarities of the great Leipsic book fair, so long the centre of the trade, the abuses with which the business was from time to time infested, and the development of copyright and of legal protection against piracy. The second part will describe the usages which regulate the transactions of booksellers *inter se*, and the third their relations to the writers of books.

Mme. von Gerold's (13) book of travel in Spain is merely the record of an ordinary tour, but is nevertheless very pleasing, from the constant good-humour of the author, who, though evidently not unaware of the besetting ills of Spain, is in ecstasies with her journey from first to last, and declines to receive or record any impressions of a less pleasurable nature.

Although not containing a word of German, a little selection of Russian poems, with an Italian translation, edited by Signor de Gubernatis (14), is perhaps entitled to mention among German books from the place of its publication, and a point may at all events be strained in favour of a collection of such genuine interest and literary merit. The versions always read agreeably, and a general affinity of spirit and sentiment, tinged with the uniform melancholy with which translations of Russian fiction have familiarized us, seems to attest their fairly representative character. The form selected may not always be the most suitable; it is easy even for those entirely unacquainted with Russian to discern that the rapid lyrical movements of Rileief's "Voinarovski" and of Pushkin's fine address to Ovid must have parted with much of their original character in passing into the stately and dignified blank verse of the Italian translator. There are altogether forty-nine pieces, the longest of which are the "Voinarovski" already mentioned and Lermontov's "Demon," one of the few Russian poems which have attained a European reputation.

Professor Sels's edition of the First Part of *Faust* (15) is unquestionably the best ever produced in this country for the purposes of the student. The concise, condensed notes explain every real difficulty with no mere ostentation of learning. Some few are perhaps superfluous, and here and there a very slight slip may be noticed; such as the employment of "contemptive" for "contemptuous"; and the rendering of *Geiste* in the satire upon Nicolai by "wits" instead of "wit," which destroys the point of the passage. The introductory chapter on the stock mistakes of English translators (many of them sufficiently pardonable) is entertaining as well as scholarly, and the history of the composition of the poem itself will be found most interesting by all genuine students. Professor Sels's profounder criticism is perhaps occasionally somewhat too profound; it seems, for instance, needless to look very far for reasons for the introduction of a witches' kitchen, or a witches' sabbath, into a drama founded on a compact with the fiend. Professor Sels also seems a little uncertain as to the moral purpose of *Faust*, which cannot indeed be properly apprehended without the Second Part. Without this sequel Goethe could not have answered as he did, when questioned respecting *Wilhelm Meister*:—"What, after all, the whole would appear to convey is that man, in spite of all his follies and aberrations, yet, led by a higher hand, attains a happy consummation at last."

Fanny Lewald's Christmas stories (16) are not remarkable in any way, but may still be recommended to readers in quest of pleasant and innocent German fiction that is not tedious. *Zünftig* (17) is a fair average circulating-library novel. "Two Years on the River Plate" (18), though but indifferently written, is redeemed from this category by the peculiar local colouring, and the author's manifest acquaintance with Monte Videan manners and politics. There is also power, though of a crude and artless sort, in the contrast between the deep and serious character of the young German immigrant, and his frivolous, yet impassioned, South American wife. "The White Lady of Greifenstein" (19) is a romantic story, readable enough, but with no literary pretensions.

The most important contribution to the *Rundschau* (20) is another of those confidential memoranda of the Russian Government whose main interest is derived, not so much from their actual contents, as from the mere fact of their being allowed to get into print in Germany. It is difficult to believe that this could happen without the connivance of Prince Bismarck, and the circumstance imparts an almost semi-official character to the editor's sturdy assertion of the inflexible determination of the German Government to resist Panslavism in the Balkan peninsula. The memorandum itself relates to the Cretan crisis of 1869, and contains ample evidence of the ill-will of Russia to Greece as well as to Austria. An article on Nordenskjöld's discoveries draws attention to the strong probability that the northernmost portion of the Old World, as of the New, will prove to consist of an archipelago of very large islands. Dr. Geffcken's review of the Prince Consort's biography will please English readers, but contains nothing new to them; and, although Bret Harte's paper on the Age of Gold in California is no doubt correctly stated not to have been published before, it must be identical with the lecture delivered by him in London under the title of "The Argonauts." The most entertaining article in the number is the second part of Hase's Parisian correspondence under the Consulate, the very romance of philology. After being nearly starved from his ignorance of French, the modest young scholar is put into the way of a livelihood through his ability to talk Arabic with one of Napoleon's Mamelukes, and confirms his position by his fluency in modern Greek, which gains him the patronage of Villoison.

THE OPPOSITION.

IT has been observed with reasonable satisfaction by Conservative journalists that, although their party suffered at the late election a reverse even more overwhelming than that undergone by the Liberals in 1874, the blow has been met in a spirit very different from that which the Liberals showed in their hour of defeat. The Conservatives have not been smitten with that dismay which swept over the Liberal ranks after a general election had gone against them. On the contrary, they seem in high, if not boisterous, spirits, and appear to enjoy being in a minority, as Mr. KINGSLEY used to say he enjoyed being out in a good bitter east wind. It is also noticed that this Conservative alacrity takes the form of free invective, hard hitting, and general aggressiveness. There also seems to be less stringency of party discipline than there used to be in the Conservative ranks, and every enterprising Conservative considers himself entitled to fight his own battle in his own way. In Parliament, to draw Mr. GLADSTONE if possible, or, if not, to bait his colleagues, to denounce every Ministerial measure, and to retard the acceptance of every Ministerial proposal; out of Parliament, to sting with epigrams or overbear with declamation, and to attack violently for the mere sake of attacking—these are the arts by which the more effervescent Conservatism now seeks to conquer and to hold the world of political life. This new attitude is not very difficult to explain. It may be said to be the tardy, but necessary, result of the Reform Bill of 1867. The electoral body then created took some years to develop its strength and to form or reveal its character, and it also took some years for politicians to understand what this body was like. The secret has been disclosed that the new electors can be won over in a mass, and that they can be won over by having very strong statements and very abusive language constantly dinned into their ears. No Conservative can be blind to the fact that the electors who six years ago gave them a majority of sixty gave their opponents this year a majority twice as great, and that the most prominent instrument of success was a constant outpouring of denunciation and abuse. The throwing of oratorical dead-cats at opponents has become at once the pastime and the machinery of political opponents. The Conservatives who invented the democracy of 1867 are now disposed to fall in with its humours. They are in good spirits, for rapidity of change in opinion may tell for them as well as against them; and they abuse because they see that to have abused is to have succeeded. Conservatives of this new school consider the stately composure of Sir ROBERT PEEL, and the patient reserve, interrupted by bursts of epigram and invective, which marked the career of Lord BEACONSFIELD, alike out of date. They have become alive to the true imperative needs of every democracy—organization and exaggeration. They have learnt a lesson from their adversaries, who anticipated them in the discovery of what the democracy required; and, although they have not as yet the Parliamentary standing, the force, or the experience of their chief teachers, they take very kindly to their task, and proficiency will probably come with practice.

The creation of the new democracy coincided with a vast spread of education, with the development of the means of communication, and an increasing pressure of population, accompanied by a rising standard of comfort. Democracy may mean almost anything, and varies in character with time and country; but in modern England democracy means the possession of political power by people who can read, who can move about, and who find it equally desirable and difficult to live comfortably. Those who cannot read have children who can; and nothing is more singular in the present day than the spectacle of a generation growing up which is a stranger in its thoughts to its own parents, and there must be some relaxation of parental control when the father and mother regard their children with distant awe and admiration. Before long the whole democracy will be more or less educated, in the sense that it will be able to read, partially to understand, and unreservedly to swear by a penny paper. Those who have attained to this intellectual height will be possessed with the fixed idea that they ought to have a subsistence commensurate with their mental dignity. But this democracy will necessarily grow up under the protecting shadow of the old social life of England, and the strength of the Conservatives lies in their power to modify the character of the democracy by social influences deeply rooted in the nation and ingrained in its character and history. But in ordinary life, and as politicians, they will be impelled or tempted to try to work a democracy as they think a democracy must be worked. Every democracy loves association, and people will rather go about with drums and flags as members of a Band of Hope than not go about at all. To be grouped somehow is the natural impulse of those who feel that without grouping they are helpless units, and people love so much to be grouped somehow that they are willing to enter into a Liberal group or a Conservative group according as one or the other is the first to invite their adhesion. Before long every electoral body will have political groups enough offered to it, and it will like to find in abuse and exaggeration the equivalent of the drums and flags which gladden the proceedings of Teetotallers and Foresters. A Conservative and a Liberal organization will confront each other with solid and unsparing defiance, and a Conservative club with granite pillars up to its second story will eclipse a Liberal club that has only got granite up to its first-floor. A constituency will become at once a rigidly grouped and a reading body. It will, of course, demand speeches, for local life is apt to be dull, and men love the bustle, the glare, and the noise of a gathering; and the voice of an eloquent man who seems to mean what he says can never lose its charm for mankind. But the ground for the speaking will have been prepared by the reading, and what men read every day must affect them more than what they hear occasionally. One consequence may be that the scene of battle will be more and more transferred from Parliament to the constituencies. There is even a danger, if obstruction goes on increasing, that Parliament may be looked on as a cumbrous machinery for disappointing the electors. And as the reading of Parliamentary speeches is, for the most part, dull work, and a politician apprehends that his speech may be skipped, it is beginning to be a common practice now for leading politicians to prefer a better vehicle of publicity, and to communicate their wisdom through the medium of a magazine. Parliament thus becomes looked on

as a second-rate vehicle for imparting instruction, while, at the same time, it is looked on as a most imperfect contrivance for getting anything done.

It is by no means certain as yet whether the experience of the last election can be taken as decisive of the character of the new democracy. The general sweeping round to the Liberal side may have been a new proof of inherent fickleness, or it may have been the beginning of a movement that, with intermissions, may last for years. It is quite possible that abuse may have suited the public taste at one moment, and may lose its spell at another. Abuse, even if justified by preceding abuse from the other side, is apt to become stale and wearisome. It is difficult to guess whether this will be so or not; for, although the exaggerations of party invective on either side may seem to calmer minds wearisome and futile, it must be borne in mind that readers of penny fiction never show themselves wearied of the eternal story in which there is a wicked baronet, a ruined countess, and a dozen murders. Still, in the long run, it may be anticipated that a reading, organized democracy, desirous of rising in the world, is more likely to lean to Liberalism than to Conservatism; and it would be too much to expect that this predominating tendency, although it may be retarded in its display, can be permanently reversed by the most vigorous Conservative organization, or by the most copious Conservative invective. But, however certain it may be that the native tendencies of a democracy will sooner or later have their way, the circumstances under which these tendencies are developed will materially affect their ultimate bearing. A democracy is only a name for a great number of living persons all open to innumerable influences, and only gradually assuming any fixed novelty of character. The democracy will grow up, not only under the influence of abusive and organizing Conservatives and abusive and organizing Liberals, but also under that of moderate Conservatives and moderate Liberals. There is no reason to suppose that, within any time which it is necessary to forecast, the mild, gentlemanlike, unaspiring Conservatism of Sir STAFFORD NORTHCOTE, or the sagacious, temperate Liberalism of Lord HARTINGTON, will have become things of the past. Rank, education, and courtesy tell every hour in some subtle way on the habits and feelings of a country of which they have got a hold, perpetuated by the long traditions of countless families among the poor as well as among the rich. The tactics and the energy of the newer Conservatism will probably affect the general position of the party, because they are in harmony with some of the circumstances in which it finds itself; but it is very unlikely that they will greatly alter its character, or permanently change its relation to the country.

LORD CHIEF JUSTICE COCKBURN.

THE death of the LORD CHIEF JUSTICE has elicited many tributes to his memory, which, with due allowance for natural kindliness of feeling, produce a just impression of his character. With the possible exception of Lord MANSFIELD, none of his predecessors have excelled him in brilliancy of intellect and variety of accomplishment. As a judge he can scarcely be placed on a level with Lord ELLENBOROUGH, or with his immediate predecessor Lord CAMPBELL. Even KENYON and TENTERDEN were sounder lawyers, perhaps because they had not dissipated their energies in pursuit of any other branch of knowledge. Sir ALEXANDER COCKBURN would probably have attained a still higher reputation if his promotion to the Bench had occurred some years later. There was a comparatively short interval between his advance to the front rank of his profession and his unwilling retirement from the Bar. When he was Attorney-General, he contended on equal terms with THESIGER and KELLY; but he never attained the pre-eminent position which was at that time held by BETHELL at the Equity Bar. Before he became a Law Officer, COCKBURN was compelled on the Western Circuit to acknowledge the superiority in success, if not in merit, of CROWDER, the most commonplace of advocates, and afterwards a respectable Puisne judge. When the rivals entered Parliament together, their relative position at the Bar was so well known, that the Ministerial managers applied in the first instance to Mr. CROWDER to hold a political brief for Lord PALMERSTON in the famous PACIFICO debate. It was only on Mr. CROWDER's refusal, in consequence of well-founded distrust of his own powers, that Mr. COCKBURN obtained and used the opportunity which at one step raised him to Parliamentary and professional rank. His speech was necessarily that of an advocate using materials supplied by others; but, a born orator, with his style polished by literary training, he was able at once to discard forensic mannerism and to satisfy the critical taste of the House of Commons. His graceful recognition of the "consular rank" of Sir ROBERT PEEL was not expressed in the technical phrase of a mere lawyer. When he sat down at the end of his speech his political fortune was made, though during his stay in the House of Commons he never rose above the ordinary level of party. If circumstances had not afterwards induced him to decline the offer of a peerage, he might perhaps in the House of Lords have succeeded to the mantle of LYNDHURST, though he would have been on the opposite side. If he was not so great a master of sarcasm, his eloquence was more ornate, and he would have emulated his predecessor's exemption from narrow prejudice.

Of his own contemporaries at the Bar, the competitor whom he most resembled was perhaps Lord CHELMSFORD. Both COCKBURN and THESIGER possessed singularly musical voices, and they both excelled in the luminous and suggestive statement of complicated facts. If Lord CHELMSFORD had been a Common Law judge, he would probably have exhibited on the Bench the same powers which had raised him to eminence at the Bar; but in variety of accomplishment and in range of intellect COCKBURN was greatly superior. Sir ALEXANDER COCKBURN was the most persuasive of judges in summing-up to juries; and his rhetorical skill was always devoted to the purpose of securing the verdict which he deemed to be just. Defeated litigants sometimes resent too ostentatious an interference with the discretion of juries; but it is not perhaps desirable that a judge should conceal his own strong conviction. A more serious drawback to judicial perfection was a habit of inclining to one of the parties before a case was fully heard. The CHIEF JUSTICE was always ready to correct his first impression, with the result of occasionally going too far in the opposite direction. In one of the protracted trials which become every day more frequent two opposing counsel, both afterwards eminent judges, remarked to their friends, in successive stages of the case, on the bias which the CHIEF JUSTICE was showing, not against the respective parties, but in their favour. He had assumed that the plaintiff was in the right until he heard the defence; and the discovery that there was a strong plausible case on the other side seemed to take him by surprise. Both parties in turn feared that the jury might, to the detriment of their respective clients, be tempted to counteract the apparent prejudice of the judge. He had also the weakness of liking to display his remarkable gifts. In cases which attracted popular attention he was intentionally and consciously eloquent, with the result of giving his enemies an excuse for calling him a "play-actor." His copious oratory and his rapidity of perception were among many causes of the intolerable duration of some notorious trials. If he would have abstained under strong provocation from interruption, the scandalous TICHBORNE trial would not have wasted the time of three judges for a year. Lord CAMPBELL would have finished the inquiry in a month, and Lord ELLENBOROUGH in a week. Two octavo volumes devoted to the report of a summing up are not a triumph of judicial efficiency. The analysis, in the CHIEF JUSTICE's polished style and in his silver voice, of the characters and motives of the parties to the conspiracy, of their victims, and of the witnesses, reminded some of the audience of passages from *Sir Charles Grandison* delivered by an accomplished reader.

Some foibles may be pardoned in a man of rare ability whose career was on the whole signalized by generosity and by public spirit. Unlike many eminent lawyers, Sir ALEXANDER COCKBURN was from his youth conspicuous and successful in general society. The son of a French mother, and of a father who as a diplomatist resided much abroad, he was an accomplished linguist, speaking three Continental languages, and he was also an elegant scholar. He wrote as fluently and gracefully as he spoke; and his occasional pamphlets displayed the same qualities with his more elaborate judgments. There was a difference of opinion as to the expediency of his published reply to the

iniquitous judgment of his colleagues in the *Alabama* arbitration; but, although it might be prudent to acquiesce in an authoritative decision, many of his countrymen felt grateful to the English arbitrator for his exposure of the monstrous perversion of justice to which, but for his protest, he might have been deemed a party. He was not less sincere, and almost equally forcible, in his attack on the Judicature Bill; but the balance of authority was against him, and experience of the working of the new system is still incomplete. His advanced age, though he had few of its infirmities, may probably account for the troublesome opposition which he offered to the introduction of the Criminal Code. His dislike of the proposed change had the negative merit of being disinterested, for simplification of the law tends to diminish the labour of judges.

The inconvenience which has arisen from the want of a sufficient staff of judges at Westminster will be greatly increased if the existing vacancies are not immediately filled. It is generally understood that the office of Chief Baron is to be suppressed; and the Government has now the opportunity of effecting a further reduction. There is no practical reason for retaining chiefs or presidents of the three Common Law divisions, which indeed might be conveniently abolished; but there are many advantages in the existence of a dignitary who may represent the whole Common Law department. If the Chief Justice of the Common Pleas is promoted to the rank of Lord Chief Justice of England, two ordinary judges may be appointed in the place of Sir FITZROY KELLY and Lord COLERIDGE. The ATTORNEY-GENERAL may probably have understood, when the Government was formed, that any customary claim attached to the office must give way to general judicial arrangements which might for public reasons be thought desirable. There is no reason to suppose that either of the Law Officers wishes to leave the Bar, and it is nearly certain that neither of them would be tempted by the offer of a Puisne judgeship. In and out of Parliament there will be found a sufficient number of competent candidates, and the LORD CHANCELLOR will not be inclined to deviate from the laudable modern custom of making promotions to the Bench without regard to politics. It is unfortunately but too probable that one or more additional vacancies may occur before long, as some of the judges are known to be in feeble health, though only one of the number is far advanced in years. Lord COLERIDGE, though he is in almost all respects unlike Sir ALEXANDER COCKBURN, would do no discredit to the high office which awaits a successor. It may be inferred from the letter addressed by the LORD CHANCELLOR to the late CHIEF JUSTICE that in any changes which may be thought expedient there will be no unnecessary disruption of ancient traditions. As the Common Law Courts are to have a principal judge, it will be far better that he should be called Lord Chief Justice than that he should be designated by some arbitrary nickname.

THE JEWS IN GERMANY.

THE debate in the Prussian Chamber on the Jews, and on the fierce enmity to which they are now exposed, excited the keenest interest, offered an opportunity of everything being said for or against the Jews that came to hand, and disclosed the deep passions which the question excites, but was chiefly remarkable on account of the attitude assumed by the Government. Only one Minister spoke, and all he had to say was that the Government did not contemplate proposing any legislative changes to the prejudice of the Jews. On the social persecution to which the Jews are exposed the Government had nothing to say. Those who hate the Jews and those who accept them as inevitable must be left to fight out their quarrel. This was virtually to countenance what is known as the anti-Semitic movement. The Court and the Government give the prevailing tone to German society, and if Court and Government have nothing to say in the way of rebuke to this strange movement, every German will at once infer that they regard it, if not with complacency, at least without disapproval. What there was to say on behalf, not so much of the Jews as of ignoring that Jews are Jews, cannot have much interest for Englishmen. To us, all the arguments that Jews, like all other subjects of the Crown, are to be treated fairly and allowed to do the best for themselves in a free competition, are mere commonplaces. What Englishmen will seek to gather, if possible, from the report of the debate is the secret of this German fury against the Jews. Why should Germany so deeply resent Jewish success and Jewish power? Unhappily, the speeches of the enemies of the Jews only reveal this secret in a very imperfect manner, and we must gather it rather from hints than statements. No doubt, one main ground of the feeling entertained towards the Jews is mere jealousy of success. The Germans are mortified to find Jews everywhere, and everywhere doing well. They make more money, and are sharper in making it, than the Germans; they understand big commerce and little commerce; they manipulate State loans, and they lend money to little proprietors; and they force themselves on in the special callings of the educated classes. The chief speaker on the Anti-Jewish side, the Court Preacher, who is the principal author of the crusade, ended his speech with a lively picture of what had lately happened on the occasion of a post-mortem examination. The corpse was the corpse of a German, but all the living persons present were Jews. The physician was a Jew, the surgeon was a Jew, the lawyer was a Jew, and the attendant official was a Jew. Unless this was a mere accident, it is, no doubt, a remarkable fact. There are only 400,000 Jews in all Germany; and if, out of so small a number, there can be found men not only to dominate in big and in small commerce, but to command a preponderance in the learned professions, the Jews of Germany must be a very able set of men. But it is not only the success of the Jews that awakens jealousy; the vices or faults that accompany the success stir the flame of anger. It would be marvellous if the Jews alone of men flushed with new success were not tainted with the faults which all other men in such a position have exhibited. They have, as their leading defender allowed, the habitual defects of *parvenus*. They are arrogant, ostentatious, often vulgar, bustling, and obtrusive. And in the country districts they behave as small land-grabbers are wont to behave in all countries. They take the utmost advantage of the law, are hard creditors and bad masters, if to exact all his rights makes the master bad. The feeling of the Germans in the country districts towards the Jews appears not unlike the feeling of the Irish towards landowners who are at once small and new.

But neither jealousy of success, nor dislike of vulgar ostentation, nor harsh exercise of legal rights seems to take us to the bottom of this German hatred of the Jews. What it may, perhaps, be really compared with is the feeling of the Californians towards the Chinese. California may be taken as the place where this feeling has shown itself in the most active form; but there are many other places, American and English, where a strong dislike of the Chinese has rooted itself in a large section of the population. The Chinese are most useful in new countries; they succeed where men of European descent fail; they underbid and triumph over the ordinary labourer of the country. They are, no doubt, disliked by those whom they outbid, simply because they outbid them. But the peculiarly bitter feeling of the Californians towards the Chinese springs from causes much more profound than the trade dislike of being undersold. The Chinese are not only hated, but feared. This fear is the fear, not of the terrible, but of the uncanny. The Chinese are a nation within a nation, an isolated group living in its own world, foreigners who not only fail to assimilate themselves with the old inhabitants, but who cohere strongly among themselves. An American has no sort of objection to a foreigner as such, and no prejudice of race or religion against any one who will help him to make money. But he feels grievously put out by the presence of foreigners in his midst who not only are aliens in religion and race, but who keep apart from him and his world, and have an organized, self-sufficing, impenetrable world of their own. Wise and liberal men in the comfortable centres of American civilization often deplore this antipathy towards people who break no laws, give no cause for offence, and contribute by their indefatigable industry to the wealth of the country. But, in spite of wise and liberal words, those who have the feeling of antipathy continue to feel it. In the same way, when we ask, not how the Germans ought to feel towards the Jews, but how they actually do feel, we find them face to face with their Chinese. The little successful and arrogant Jewish world within the German world shocks and alarms them. It is not so much because the Jews do not accept the New

Testament, or because they are not Caucasians, or because they are clever and sometimes successful, that the Jews are feared and disliked in Germany; but because they form a perpetual, closely-cemented clique of foreigners, a clique into which there is no entrance for outsiders, and yet which never decays. And what moves the patriotic German to extreme wrath more than anything else is that this clique not only pushes forward its conquering hand into every sphere of German life, but actually has the audacity to tell Germans what they ought to do and to think. No charge against the Jews seems to have been thought by their opponents so telling as that they have got a great part of the German press into their hands.

In time, as ample experience proves, such faults as the Jews may now exhibit in Germany would pass away, if not entirely, yet in a tolerable measure. They would cease to be newly rich, and would grow ashamed of vulgar ostentation. They would be received among older landowners, and would adopt the tone of an old landed society. They would stick to each other, and yet mix freely and pleasantly with the German world. England is perhaps hardly a fair instance to take, for the Jews here are only about one-tenth of the German Jews. But in France the number of Jews is about equal to the number of Jews in Germany, and in France the Jews give no offence. There must be causes in the position of Germans as well as in the nature and habits of Jews to account for the German hatred of these terrible Semitic people. These causes are not, perhaps, far to seek. Germany is at once a very old country and a very new one. It is the seat of an ancient civilization, but has been so devastated by war and so enfeebled by intestine divisions that it can even now scarcely believe that it exists. There are three salient features in the Germans of the present day. They are class-ridden; they are poor in proportion to their place in Europe; and they are timid, not of course physically, but morally and socially. The rigid distinction between noble and non-noble is the product of their old and peculiar civilization. Their poverty and their timidity are the products of their calamities and their divisions. To dwell on these special characteristics of their present state would be most unjust in a general sketch, unless due prominence were also given to the other great qualities of the race—its patience, its industry, its intellectual fearlessness, its emotional vivacity, its loyalty to the Crown and devotion to the State. But, in speaking of the German hatred of the Jews, it is only necessary to dwell on peculiarities which cause or intensify this hatred. The dislike of the vulgar *parvenu* is sure to be excessively strong in a society where there is a very large, a very poor, and a very dominant nobility. The comparative poverty of the Germans opens the field for those who have got money to lay out alike on the biggest speculation or the humblest usury. The habitual timidity of the Germans makes them very much afraid of anything of which they are afraid at all. They live in an atmosphere of panic as to what the Court will do, as to when Prince BISMARCK will retire from the scene, as to what the POPE will order, as to what France or Russia may be plotting. It is extraordinary how the faintest adverse rumour will flutter a people which ten years ago performed some of the greatest military feats recorded in history, which is armed to the teeth, and is supposed to be without a rival in the arts of war. The Germans who are proudest of Germany seem always to be surprised that there is a Germany to be proud of. In time, if things go well, all this will be changed. There will be greater equality of classes; there will be increased wealth; there will be more assured confidence. But this is only saying that, if the relations of the Germans to the Jews become what they ought to be, it is the Germans, as well as the Jews, who will have undergone a change.

IRELAND.

SOME of the GRACCHI of the Liberal party, *de seditione quærentes*, have the effrontery to affect surprise and anger at Lord SALISBURY's denunciation of the Irish policy of the Government. The stump orators of last winter hold that the most lenient construction ought to be put on the acts of responsible Ministers. It is, in truth, often a doubtful question whether it is expedient to give public expression to strong feelings and positive opinions. If Lord SALISBURY had, like the majority of his late colleagues, reserved himself for discussion in Parliament, his silence would have been intelligible; but it is not surprising that he should prefer the opposite course of attempting to rally the Conservative party after its heavy disaster. In his latest speech Lord SALISBURY referred but slightly to the foreign policy of the Government, professing, by a conventional fiction, to think that Mr. GLADSTONE is ostensibly continuing the policy of his predecessors. It would be difficult to fix the attention of an English audience on the tedious affair of Dulcigno, or indeed on any other subject than the social war which has been allowed to spread over a large part of Ireland. Lord SALISBURY was fully justified in his assertion that some members of the Government sympathize with the objects, though not with the methods, of the Land League. It is also true that the whole Cabinet tolerates a state of ruinous anarchy, because the exertion of necessary vigour would cause a certain amount of party embarrassment. Mr. BRIGHT and Mr. CHAMBERLAIN have obtained a temporary triumph over their moderate colleagues, some of whom are, in the odd phrase of the Gladstonizing *Standard*, deficient in loyalty to their chief. It was but right that Lord SALISBURY should expose, among other fallacies, Mr. BRIGHT's reckless statement that Irish distress is to be attributed to the great extent of land which is owned by single proprietors. It is notorious that the harshest landlords are the small purchasers in the Landed Estates Court, not by their own fault, but because petty capitalists cannot afford to be profusely generous. It may be true that on some large estates the tenantry have been indirectly impoverished by the laxity of absentee proprietors in permitting undue subdivision. The same class has encouraged the clamour for fixity of tenure by demanding low rents which give the occupier a beneficial interest in the soil. Mr. BRIGHT's hatred of a landed aristocracy is one of the causes which prevent him from recognizing the grave responsibility incurred by Ministers who, for their own supposed convenience, allow for a month, a week, or a day, prolonged impunity to the worst of tyrannies. The Birmingham meeting, and the submission of the majority of the Cabinet to the extreme faction, have since received more instructive comments than even Lord SALISBURY's sarcastic speech. Two or three murders, several sentences of social excommunication, and not a few outrages have been perpetrated, all of which might perhaps have been prevented if the Ministers had not refused a fortnight ago to summon Parliament for the purpose of obtaining extraordinary powers.

A part of the case which is common to the Irish landlords and to the English nation as it is interested in the connexion with Ireland is ably expounded in a pamphlet published by the Irish Land Committee under the title of *Confiscation or Contract*. The writer, who is said to be Dr. WEBB of Trinity College, calls attention to Mr. DEASY's Land Act of 1860, which has not been sufficiently noticed in recent discussions. "By the "primary provision of that statute it is 'enacted that "'the relation of landlord and tenant shall be deemed to "'be founded on the express or implied contract of the "'parties, and not on tenure or service.' The relation "'shall be deemed to subsist in all cases in which there "'shall be an agreement by one party to hold land from "'or under another in consideration of any rent.'" The exclusive validity of contracts was partially limited by Mr. GLADSTONE's Act of 1870. So far as small tenants were in case of eviction allowed compensation for disturbance, a practical right of tenure was created. The author of the Bill repeatedly protested against the assumption that he gave the occupier any property in the land; but the fruitful germ of further encroachments on the rights of landowners was included in the new enactment. As the writer of the pamphlet forcibly contends, the institution of landlords cannot be abolished by Act of Parliament, though one proprietor may be arbitrarily substituted for another. The security enjoyed by small landlords is illustrated by the case of a man who let his property of forty acres to two or three tenants while he earned his own livelihood in another occupation. Returning at last with a small pension, he resumed possession of a part of his land, and he was immediately murdered. Mr. BRIGHT himself will scarcely refer the crime to the English Conquest, or even to the vicious consequences of primogeniture and entail. Judge LONGFIELD of the Landed

Estates Court, in a passage quoted in the pamphlet, expresses a confident opinion that the subdivision of Irish land into small freeholds would largely increase the number of agrarian murders. Nevertheless theorists and amateurs refuse to punish or to prevent crime and outrage until they have tried fanciful experiments which in their judgment might perhaps gradually diminish the temptation to kill, to torture, and to rob. It is not even thought necessary to devise a definite remedy for the supposed defects of Irish land tenure. The purport of the Birmingham speeches was that force ought not to be employed until the grievances of the Irish tenantry were redressed. Whether their assumed grievances were susceptible of cure was a secondary question.

Under the Act of 1870, as in all other schemes of legislation, the indispensable condition of occupancy was payment of rent; and it will be difficult for the most reckless projectors, except indeed the shameless demagogues of the Land League, to contrive any mode of exempting the tenant from the obligation which would be created equally by tenure or by contract. Yet it is against rent, as such, that the agitators and assassins are directing their efforts. The speakers at the meetings sometimes allow the tenants to tender the amount of GRIFFITH's valuation, though they treat a standard established for a wholly different purpose only as a *maximum*, and not as a uniform rule. The leaders have lately declared that the Land League branch in each district must fix the amount or proportion of rent, if any, which is to be paid. If, as might well have been the case, the Government valuation had been higher than the average rent, it would have been universally and rightly disregarded. It is obvious that if the debtor, or a self-appointed tribunal acting in the interest of the debtor, can repudiate the contract of tenancy and fix an arbitrary rent, he is equally entitled to reduce his present offer by one-half, or to withhold payment altogether. Fixity of tenure, accompanied by a valuation of land and a rent settled by Act of Parliament, would in no degree affect the operations or the doctrines of the Land League. If every tenant in Ireland were endowed with perpetual possession at half his former rent, he would be quite as well disposed as at present to refuse payment to the landlord, and to maltreat the person and the live stock of a neighbour more honest than himself. Even if the wild project of a State purchase of the land and of a demise to the occupier at a rent including a Sinking Fund were to be tried, the Government would be at the mercy of the seditious clubs which would not fail to dissuade the occupier from payment of tribute to an alien Government. The honour of the Irish peasant is a frail security, though he is possibly not more dishonest by nature than members of the same class in other countries. The peculiarity of his condition is that he is habitually guided by adventurers of the basest kind.

Lord SALISBURY and Sir STAFFORD NORTHCOTE are about to deliver additional speeches; but, on the whole, the interests of the country would at present be most effectually served by leaving the Liberal majority to itself. An attack always in a certain sense facilitates defence by furnishing materials for criticism or for retaliation. Public attention may be more advantageously concentrated on the acts or on the inaction of the Government than on real or alleged defects in the reasoning of their opponents. In the Liberal party there are many men who are both intelligent and honest, and some of them have lately uttered warnings to which the Ministers would in their own interest do well to attend. Few recent speakers at public meetings have sympathized with the impenetrable bigotry of Birmingham; and it may be remembered that Mr. BRIGHT himself considers it unreasonable that a debtor should fix for himself the amount to be paid. Owners of English land must be singularly shortsighted if they fail to foresee the application to their own property of the doctrines which are propagated in Ireland; and land is not the only form of wealth which is threatened with spoliation. One of the most whimsical incidents of Irish turbulence is a threatening letter addressed to an employer in Dublin because he paid his workmen, not too little, but too much. Some rival thought that the methods of agrarian legislation would be as applicable to the promotion of his own interest as to the equally selfish purposes of tenant-farmers. Popular feeling in England is not favourable to the Land League; and there is little doubt that some of the Ministers share the general repugnance and alarm. It is nevertheless not to be supposed that they are deliberately and consciously parties to a dereliction of duty which puzzles and astonishes the non-official community.

THE FRENCH REFORM BILL.

THE French Deputies are apparently more concerned about their own irremovability than about the irremovability of the judges. They have voted almost without discussion the clause which, for the space of a year, converts the whole French magistracy into so many dependents of the Minister of Justice; but they show occasional symptoms of unwillingness to pass a Reform Bill which will probably be fatal to the re-election of a great number of their own body. The Committee of Initiative decided in the first instance by eight votes against five not to recommend the Chamber of Deputies to take into consideration the Bill re-establishing the *Scrutin de liste*. There was never, of course, any question of carrying out this recommendation in its integrity. It cannot be denied that a Reform Bill which has long been demanded by the Left has a just claim to all the thought and labour which the Chamber has to bestow on it, and as the present Session must be followed by a general election, there is plainly no time to be lost in taking it in hand. The Committee of Initiative has been greatly abused for even suggesting that the Chamber should refuse to discuss M. BARDOUX's Bill. It would have been fairer to remember that responsibility and power go together, and that, as the vote of the Committee did not really interfere with the progress of the measure thus condemned in advance, there was no reason why the members should not take this method of conveying to their colleagues their opinion that the Bill ought to be rejected. As soon, however, as the Committee had given its vote, it seems to have been terrified at its own boldness. It had actually recommended the Chamber not to take into consideration a Bill of which M. GAMBETTA is known to be an ardent supporter. No doubt the Chamber would disregard the vote, and debate the Bill just as thoroughly as though the Committee had never suggested that it should be passed over. But in that case, why should the Committee set itself up as a target for M. GAMBETTA's wrath? If their vote could have really helped on the rejection of the Bill, it might have been worth while to run some risk for so excellent an object. But, supposing the Bill should be passed after all, the eight deputies who had sounded the first note of opposition would be marked men. This consideration seems to have been conclusive in the case of five out of the eight. When the Report of the Committee came to be considered previously to its presentation to the Chamber, only three members were found to support the original recommendation.

Still, there is even now an unusual degree of uncertainty as to the decision of the Chamber of Deputies. Ordinarily, any proposal which has the support of the leader of the Left is sure of a majority. The Chamber has been capricious in its votes where the existence of Ministries has been in question; but it has been thoroughly consistent in its acceptance of Radical measures. In the present instance this agreement shows some signs of breaking up. The arguments urged against the retention of the *Scrutin d'arrondissement* are of a kind which are calculated to make a strong, but hardly a favourable, impression on the minds of the deputies. It is said, probably with a great deal of truth, that the present system, which allots one deputy to every arrondissement, and an additional deputy for every additional 100,000 inhabitants, gives undue importance to local popularity on the part of the candidates. It is the local lawyer, the local doctor, the local editor, that has the best chance of winning votes. Men of this class may be very good members of a municipal or departmental Council, but they are not good members of the Chamber of Deputies. Under a system which allotted deputies to each department in proportion to its population, and gave each elector as many votes as there were seats to be filled, these estimable but unpolitical personages would have no chance of being returned. The contest would turn entirely upon questions of national interest, and the electors of a whole department, knowing nothing about the particular concerns of the several arrondissements, would look out for men who had already made some reputation for themselves—if they

were to be had—and, at all events, for men who came to them recommended by the leaders in whom they had confidence. The more the existing Chamber considers this argument, the less likely it is to be really convinced by it. To expect the deputies to support M. BARDOUX's Bill is to expect the local lawyer, the local doctor, and the local editor to pass a self-denying ordinance. It is they who to a great extent compose the Chamber. The *Scrutin d'arrondissement* is dear to them precisely for the reason that it is abused by the advocates of the Bill. It has sent them to Paris, and invested them with whatever dignity belongs to the representatives of the nation. If it were possible to persuade them that the return to the *Scrutin de liste* would work no material change in the composition of the Chamber, and that at the next election, equally with the last, local eminence would be the best passport to the goodwill of the electors, they would have no objection to support the change. But, in all the speeches and articles which are to be found upon this side of the controversy, the exact contrary is preached. The Legislature is asked to purge itself of these unworthy elements, and to take care that they do not again make part of it. Why should the unworthy elements themselves contribute towards their own extinction? It is very doubtful, again, whether the constituencies which these unworthy elements represent would thank them for voting their extinction. The value which electors set upon the privilege of returning a member is commonly in inverse proportion to the number of those who possess it. No one cares to be swamped in a crowd of voters about whose opinions he neither knows nor cares anything. The case set up in favour of the *Scrutin de liste* over the *Scrutin d'arrondissement* is no more likely to find favour with the constituencies than with the deputies. Why is it that, under the *Scrutin d'arrondissement*, the electors so often return the local lawyer, the local doctor, the local editor? For the very good reason that they think these particular candidates the best men for the work they will be wanted to do. A small constituency cannot always be thinking of the fortunes of the Republic; it must from time to time pay some attention to its own fortunes. It wants a share in the distribution of official patronage, or to have some little job negotiated for its benefit. A candidate chosen on account of his views upon general policy, or on the recommendation of a Committee sitting in Paris, will not be nearly so useful for these purposes as a local candidate. Of course this difficulty is one that has to be got over wherever it is a question of redistributing seats in Parliament. But in other cases the advocates of redistribution have usually had two advantages which are denied them in the present case. Redistribution has for the most part been associated with extension of the suffrage, and the smaller constituencies have waived their pretensions in view of the necessity of admitting a hitherto unrepresented class into the electorate. Under universal suffrage this inducement loses its force. Every man already has a vote; and a vote is all that he can have, whether he uses it in an arrondissement or in a department. Nor does the *Scrutin d'arrondissement* furnish any of the scandals which time and change occasionally bring about in older representative systems. The arrondissement is in no case a small constituency, except in comparison with some larger one. There are no Old Sarums in France.

Against this natural unwillingness to upset the existing system must be set the facts that M. GAMBETTA wishes it upset, and that the *Scrutin de liste* has always been a shibboleth with the Extreme Left. It is just possible, however, that these two considerations may go some way towards balancing one another. It is commonly said that M. GAMBETTA's friendship for the Bill is partly due to his belief that he will be returned at the head of the poll in a great many departments at once, and will thus be designated by a sort of informal plebiscite for the supreme place in the State. It is natural enough that M. GAMBETTA, if he entertains this expectation, should wish to see the *Scrutin de liste* restored, and the sudden repentance of the Committee of Initiative is evidence how great his influence in the Chamber still is. But there must be a very large minority among the deputies of the Extreme Left who are not at all anxious to see M. GAMBETTA carried to the head of affairs by this process of simultaneous election. If, therefore, they are of the same opinion as to the effect of re-establishing the *Scrutin de liste*, they may not be above coming to some understanding with timid deputies of moderate opinions which may enable the latter to consult their convictions without neglecting their safety. In this way the Extreme Left may have the satisfaction of voting for a democratic measure, while avoiding the practical inconvenience which its adoption might cause them. Whether it is best for France to retain the *Scrutin d'arrondissement*, or to go back to the *Scrutin de liste*, is a point upon which happily it is not necessary for foreigners to have a strong opinion. The caprices of the existing Chamber certainly furnish an argument in favour of a change. If, as is alleged, the formation of a working Ministerial majority is impossible under the present distribution of seats, it is a very serious drawback to any political machinery. But the value of a working majority depends upon the accuracy with which it represents the majority in the country; and whether election by departments would secure this better than election by arrondissements is a very doubtful matter.

SOUTH AFRICA.

THE war with the Basutos can have only one result; for, if the colonial forces fail to suppress the insurrection, the Imperial Government cannot refuse to come to their aid. The late accounts of the struggle have not been encouraging, but the reinforcements which are proceeding to the seat of war may perhaps restore the superiority of the colonial forces. The Cape Government is, for intelligible reasons, anxious to finish the contest without external interference. It seems that Mr. SPRIGG was in error if he supposed that the Colonial Office had assented to his claim of exclusive control over the relations with the natives in the event of a successful termination of the war. He had, in fact, been warned that the Home Government reserved to itself entire freedom of action; but, if the colonists thoroughly defeat the Basutos, Mr. SPRIGG's anticipations will be practically realized. The Aborigines Protection Society is too late in its protest against Mr. SPRIGG's policy. It may be true that, as Mr. FROUDE stated, the Cape Administration cannot, under the terms of their Constitution, make war on an external independent Power without the QUEEN's consent; but the prohibition was evidently intended to apply to the case of civilized States, and not to inevitable conflicts with native tribes. "They professed," as Mr. FROUDE proceeded to say, "to be putting down a rebellion, and it "was by our act that they could treat the natives as "British subjects." The substance of Mr. FROUDE's contention was that the Imperial Government ought to exercise its sovereignty or protectorate over the Basutos, instead of allowing the colony to regard them as subject to its own legislation or coercion. The Cape Parliament never doubted its authority to pass an Act for disarming the Basutos; and the measure provoked no remonstrance from the SECRETARY for the COLONIES. It followed that the collision which ensued was in the nature of a civil war, and that, if the local Government suppresses the resistance of the native chiefs, it will be entitled, or at least enabled, to take such precautions as it may think fit against the renewal of the contest. It will then be useless to argue that the land occupied by the Basutos lies outside the limits of the colony. The reserved right of the Imperial Government to supervise the terms of peace will only come into operation if it becomes necessary to check any tendency to oppression. There is, as Lord KIMBERLEY said in answer to Mr. FROUDE, no danger of extermination; but it may perhaps be proper to guard against measures inconsistent with the personal liberty of the natives. It is but just to admit that, after the last border war, the Cape Government showed no tyrannical or intolerant disposition.

It is fortunate that the Colonial Office, unlike some other departments of State, has of late years been for the most part administered without respect to domestic party struggles. Lord CARDWELL, Lord CARNARVON, and Lord KIMBERLEY have promoted a consistent and continuous policy, from which the present Minister is not inclined to depart. The project of federation, which is for the present suspended, was principally designed as a step to the establishment of a common native policy and a joint system of defence. The Cape Parliament has on more than one occasion intimated its indifference to provision against dangers which principally threatened the

weaker neighbouring provinces. The suppression of the Gaika and Galeka revolts, though it was mainly effected by the regular troops, confirmed the confidence of the colonists; but they are now reminded that the native population within their own dominions is still formidable. It is possible that they may be compelled to solicit the co-operation of Natal, and they probably watch with uneasiness symptoms of a rebellious disposition in the Transvaal. The necessary result of confederation would be the final assumption by the colonies of the burden of native wars, and consequently of the regulation of native relations. The deputation from the Aborigines Protection Society virtually requested the Imperial Government to withdraw from the Cape Colony the control both of war and of peace. Mr. FROUDE's remark that the Home Government was responsible for having transferred its powers to the colonial Legislature could at most only have an historical value. The gift of qualified independence, whether or not it was prudently made, is in its nature irrevocable. Even if Lord KIMBERLEY had not retained his faith in the expediency of the measure, he would have wasted time in discussing its merits. It is true that a small section of colonial politicians holds that the concession of responsible government was premature; but the controversy is sustained rather as a form of criticism on the actual Administration than in the hope or with the wish of reversing a completed policy.

In his judicious and argumentative answer to the deputation, Lord KIMBERLEY rebuked only by contemptuous silence the flippant vulgarity of a facetious newspaper Correspondent who thought fit to intervene in the discussion with an impertinent letter. The assertion that Sir BARTLE FRERE, who has nothing to do with the matter, "sees the "finger of GOD in the trigger of the breechloader," was in the most approved form of Correspondent rhetoric. The Basutos, it seems, "were faithful, devoted, and loyal to "the core, and they murdered the Zulus with exemplary "ferocity and cruelty." In another paragraph bombast takes the place of irony; but it would be tedious to record how empires founded on the ruin of unoffending races inevitably sink beneath the maledictions and ill-will of the conquered. Unfortunately, most empires have been founded by conquest, which may probably have provoked curses, or, in finer language, malediction. The English nation has not yet succumbed to the malediction of the Britons, who, according to the best historical testimony, were either expelled or exterminated. The Basutos are not yet even conquered; and it is necessary to run the risk of their future maledictions. The suggestion that South Africa should be governed like India was not less absurd, though it was propounded in more decorous terms. The substitution of a benevolent despotism for representative government in a country inhabited by Englishmen and by Europeans who are their equals was properly dismissed by Lord KIMBERLEY with a simple expression of dissent. To the more serious proposal of the assertion of Imperial sovereignty over native territory, he replied that the colony would not surrender its claims, and that we should have no power to govern the territory if we took it under our direct control. The opposite policy has been deliberately pursued. The only Imperial troops in the colony form the garrison at Cape Town; and it is not intended, except in case of necessity, to increase their numbers. Lord KIMBERLEY reasonably thinks that, as in former times, native wars would be likely to arise if the colonies were not responsible for the consequences of collision. In New Zealand the colonists, since they have been left to themselves, have dealt more successfully with the natives than when they were supported by ten thousand English soldiers. The diminution of the numbers of the Maori race is probably not the direct result of the more complete establishment of English supremacy. No similar misfortune is to be apprehended in South Africa, where the boundless interior of the continent is still an *officina barbarorum*. Even within the English dominion, and especially in Natal, the native population constantly increases.

In the last Blue-book on South African affairs the only interesting document is the answer of Sir BARTLE FRERE to the despatch in which his recall had been announced. No public servant in modern times has been subject to greater provocation, and Sir BARTLE FRERE has not always resisted the temptation to stretch the bonds of official discipline. His answer to Lord KIMBERLEY is a virtual reprimand, scarcely disguised by the ordinary forms of deference. He reproves the Government for the assumption that the policy of confederation has become hopeless because the consideration of the subject was adjourned by the Colonial Parliament. He still believes that the project is feasible, and that it will be carried into effect at an early period. During the late debates some members of the local Opposition professed to be in close correspondence with leaders of the Liberal party in England, who had repeatedly professed their hostility to Sir BARTLE FRERE and his policy. The dispute, though it is recent, is for practical purposes obsolete, and both Sir BARTLE FRERE and his opponents must content themselves with incomplete success. There is but one opinion as to the shabbiness of the treatment which he has received from the present Government. Lord KIMBERLEY, and even Mr. GLADSTONE, may perhaps have found it expedient to yield to the clamour of their colleagues or of agitators outside. In defiance of precedent, they punished him for unpopular acts after they had condoned any offence which he might have committed by continuing to employ his services. Sir BARTLE FRERE significantly hopes that his dismissal may not increase the embarrassments which were impending at the date of his letter in Basutoland and the Transvaal. For the disarmament of the Basutos the Colonial Ministry, and not the Government, was exclusively responsible. Lord KIMBERLEY properly holds both that the measure was right in principle, and yet that it was impolitic because it was inopportune. The uncertain contest which still continues convicts Mr. SPRIGG of a grave mistake.

IMPRISONED CLERGYMEN.

OUR daily instructors display a remarkable want of foresight, knowledge, or breadth of view, in the way in which they treat the ugly sight of a self-constituted and irresponsible Society enforcing its ritual prepossessions by haling to prison clergymen devoted to their duties and blameless in their lives. The real question at issue in all its perplexing intricacies is one with which these writers decline to entangle themselves, while any expression of indignation at the savage stupidity of the Church Association might involve unpopular admissions. Consequently the only alternative left is to denounce the obstinacy and the lawlessness of men with whom—however opinionated they may be—the only possible inducement voluntarily to submit to great discomforts can be the belief that they are obeying the paramount obligation of conscience. So the poor device of personal sarcasm is the resort of writers afraid or unable to probe a deep and pressingly important question, when they might naturally ask whether this strange phenomenon of passive endurance divorced from agitation is not *primâ facie* evidence of something out of joint in the ecclesiastical commonwealth. One man encourages another in his suggestions of dead repression, till the shrieking chorus culminates in the strident note of a Diocesan Chancellor, who finds it convenient to forget his responsibilities of judge as he clamours to pitch the recalcitrant clergymen, like so many cracked bells, into the seething cauldron of deprivation.

Difficult as the effort may seem, we shall endeavour to treat the matter without respect of persons, and to regard Lord PENZANCE, prelates, and members of the Judicial Committee on one side, and Messrs. DALE, ENRAGHT, and GREEN on the other—not to mention the mixed multitude of Associationists and Unionists—as a matter-of-fact student might contemplate so many algebraical symbols. The only human weakness left to us is the self-consciousness which gives the right to claim the credit of having been true prophets at an excited period of general perversity. We never shrank from declaring our conviction that the policy of the Public Worship Act was essentially one of injustice, and we proclaimed the certain failure of tactics so unfair. In the imprisonment of these clergymen we see the verification of our prediction. It may be true that technically the *Significavit* which has turned the key upon these gentlemen is not one of the penalties of that statute. But, had it not been for the encouragement which that measure gave to persecution, this obsolete weapon never would have been furbished up for present use.

Step by step the actual complication has been reached. The appointment as judge under the Act of a man so notoriously unversed in ecclesiastical law and so conversant with very different procedures as Lord PENZANCE

surprised all impartial men and shocked many. The wrangle over that Judge's salary failed to enhance his dignity. His refusal to accept his appointment by the old traditionary forms undermined the basis of his presumable authority. . The apparent prejudice against one school of ceremonial, which confessedly lay at the bottom of the Worship Act, seemed to crop up in the RIDSDALE as it had done in the PURCHAS judgment; while the latitude given to doctrine in the BENNETT case deprived that prejudice of any logical basis, and a literary bookseller assailed the historical groundwork of the RIDSDALE judgment with considerations as yet unanswered by its authors. Finally, the Bishop of OXFORD'S triumph in the Court of Appeal covered the new jurisdiction with ridicule. The upshot is that the Church Association has abandoned the perilous ways of argument and betaken itself to fines and fetters. So, at a crisis when the Establishment is called upon to justify its existence in the eyes of jealous foes as the Church of the nation, the edifying spectacle is afforded of an internecine war between two parties, each convinced of the legality of its own type of worship, one of which claims supremacy backed by imprisonment, and the other is content to accept toleration won by endurance.

It is a natural result of this distempered condition of ecclesiastical affairs that the controversy has spread beyond the legal grievances alleged against the jurisdiction set up by the Public Worship Act, and the ritual wrongs believed to have been inflicted by the judgments of the Judicial Committee. Consequently the long-slumbering repugnance to the constitution of the latter tribunal as the Court of Ecclesiastical Appeal, of which so moderate a Churchman as Bishop BLOMFIELD, and more lately Bishop WILBERFORCE, had made himself mouthpiece, has now blazed up into a white flame of fierce opposition. It is a strong point against the retention of ecclesiastical jurisdiction in the Judicial Committee that this was taken away in Lord SELBORNE'S original scheme of judicial reform passed in 1873, and was only restored when the House was again set up as the Court of Ultimate Appeal. The peacemaker will accordingly find himself confronted by two demands from the party which believes itself to be wronged—the one for a reconstruction of the actual system of ecclesiastical appeals, and the other for a reconsideration of the decisions which claim to settle the limits of permissible ritual. The first may be abstractedly the wider-reaching and more fundamental question, but the second is the one on which practical men will be more anxious to reach an early understanding; for any sincere and searching consideration of the principles on which the Court of Appeal should be constructed must continue impossible so long as the inquiry is conducted in hope or in fear of a particular decision from the novel jurisdiction.

If both parties to the ritual contention were pledged to the suppression of the opposite opinion, all hope of peace would have to be abandoned. Happily these exclusive tactics are the watchword of only one of the two sides. It is not less undoubted that, if the controversy, as formulated by the RIDSDALE judgment, were between those accessories of worship which had always been found in the Reformed Church of England and others which had never been found there, the advocates of the last-named ceremonial might, on historical grounds, be ruled out of court. But, according to the judgment itself, things which it admitted and things which it prohibited were both of them, by the recital of that very document, in and of the Reformed Church till a certain date many years after ELIZABETH'S accession, and then were only prohibited by a presumed act of Royal authority for which, in the singular absence of direct proof, secondary and inferential evidence had to be alleged. So, then, ultimately the plea of the complaining party is narrowed to the request that the validity of ELIZABETH'S alleged prohibition should be tested by a more searching and express inquiry into the real constitutional character of the document called "the Advertisements" of that sovereign. Its existence is undoubted as a pamphlet published by Archbishop PARKER; but this pamphlet of 1566, as all who have glanced at it must own, carries no royal signature or express endorsement demonstrating that it is that Order under an Act of Parliament of 1559 which alone can claim to be endued with authority equivalent to that of a statute. No middle term exists between the Advertisements being statutable law by inference, or good advice from Archbishop PARKER equivalent in legal force to the Bishop of MANCHESTER'S late Charge. We forbear from pressing the further equitable consideration that, if the legal stringency of the Advertisements were conclusively established, it might be as politic as it would be gracious to concede a permissive and limited relaxation in favour of that which the position taken up by the other side shows to be accidentally, and not essentially, outside of the Reformed English Church. Correlative to this would be the ratification of that virtual promise which the Ritualists have in effect given, that success would not be pressed against those to whom the recovered ornaments would be distasteful, but that proved legality should be construed as merely carrying permission. The common answer to this reasonable claim has been the confident assertion that the controversy is one with only a handful of the clergy on one side and all the laity on the other. The meetings held on behalf of Mr. DALE, whether wise or unwise in their utterances, sufficiently refute this threadbare pretence. The comparative census of religious parties is of course unattainable, but the fact is as plain as the sun at noonday that Ritualism, so-called, and its Puritan opposite are, one as well as the other, the conviction of a party made up in due proportions of clergy and laity, supporting and inciting each other in their distinctive practices. Each of these parties professes its loyalty to the Church of England, and each points to salient passages in the past history of that Church in vindication of its professions. Wisdom cries in the streets that, if the Established Church is to be preserved as a national institution, each party must be taken at its own estimate, and left to find its level within certain easily defined limits. Practical arrangements are no doubt most seriously hampered by the obstacles which stand in the way of any invitation to Parliament to arbitrate in Church disputes; but it is always allowable to lay down principles. We may therefore safely assert that the criterion of permissibility might most safely take an historical shape, while it would be reasonably restricted within the narrow compass of those few editions of the Prayer-Book which have been in authorized use since the Reformation.

COLONEL GORDON ON CHINESE POLICY.

THE *St. James's Gazette* of Tuesday printed a very interesting memorandum, stated to have been drawn up by Colonel GORDON for the use of the Chinese Government. The document, which may, we presume, be accepted as genuine, at any rate bears the marks of long study and intimate knowledge of the Chinese character. It embodies a complete military policy, based on the principle that, in order to succeed in a war with a foreign Power, China must make use of the special advantages she enjoys, and not attempt to meet her enemies on their own ground. She possesses, says Colonel GORDON, "a "long-used military organization, a regular military dis-"cipline," and his advice to her is to "leave it intact." Colonel GORDON is entirely superior to the temptation to organize and discipline Chinese troops on European models. His theory evidently is that a European enemy will be more embarrassed by being encountered after the native fashion than if he had to do with a probably inferior copy of his own system. A foreign army landing on the Chinese coast or crossing the Chinese frontier must of necessity be limited in numbers. But the Chinese army may be practically unlimited. What the Chinese Government should aim at, therefore, is such a kind of military excellence as can be imparted to very large bodies of men. A foreign general will know how to defeat an army disciplined like his own, which he can induce to stand a pitched battle; but he may be utterly puzzled how to defeat an army which comes against him, like a cloud of flies, which never seem to change their place, and yet are always around him. The aim of a Chinese commander, according to Colonel GORDON, should never be to defeat his adversaries. He should always be content with worrying them. He should avoid giving battle, and use his troops entirely in cutting off the enemy's communications, in attacking his baggage, and even in keeping him awake. This last recommendation is a curious example of the shrewd minuteness to which Colonel GORDON descends. He advises the Government to have "a few small-bored, very long-range wall-pieces, "rifled and breech loaders." These are to be planted a long way off from the enemy's camp, where they will be

safe from attack. If it should turn out that they are not safe from attack, they are on no account to be defended. The advice Colonel GORDON gives to the Chinese in that event is perfectly frank. They are to run away. The loss of the piece or two that the enemy may take will matter much less than the loss of the men who might be slain in keeping them. The object of firing from a distance is not to kill or wound the enemy, but to prevent him from sleeping. "If he does not sleep, then he gets ill, "and goes into hospital, and there needs other enemies to "take care of him, and thus the enemy's numbers are "reduced." The army is, under no circumstances, to trouble itself about fortifications. If it wishes to reduce a fort, it should do it by starvation, not by assault. If a fort is attacked, the garrison ought not to stay to stand a siege, but to go out at once, and harass the enemy in the rear. The Chinese troops, properly equipped, "can move two to every "one li the enemy marches." To-day they "will be before "him; to-morrow they will be behind him; the next day "they will be on his left hand; and so on, till the enemy "gets tired and cross with such long walks, and his "soldiers quarrel with their officers, and get sick."

The arms of the Chinese troops are to be of a piece with their tactics. An abundance of fairly serviceable rifles is of more use than a smaller number of more perfect weapons, and the money which will buy a few of the one will buy a large number of the other. Even if the Chinese were armed only with swords and spears, they might hope to beat the best regular troops, provided that they outnumbered them; and if, instead of carrying swords and spears, they carry ordinary breechloaders, the victory will certainly be theirs. Ten breechloaders carrying up to 1,000 yards are more useful than five carrying up to 1,500. If the Chinese soldiers were given the latter weapons, they would not know how to use them, and only five men could be armed for the money which would arm ten men with the former. The rifles should not be very light or delicately made. Weight does not matter to a Chinaman who carries no kit. Financial exhaustion is apparently the form of defeat which Colonel GORDON most fears for China. He is more anxious to husband her money than to husband her men, and is willing to put up with moderate efficiency in military equipments, if only he can get equipments of moderate efficiency for all the men who will be ready to carry them. His advice about artillery and torpedoes runs in just the same strain. The Chinese are to get them cheap, in order to be able to have more of them. The utility of torpedoes is in direct proportion to the number there are of them. If they are only used at certain places, "then the enemy knows that "he has to look out when near those places." But when he does not know where they may not be, "he can never "feel safe; he is always anxious; he cannot sleep; he "gets ill, and dies." The misery caused by prolonged want of sleep seems to be constantly present to Colonel GORDON's imagination. To be plentiful, torpedoes must be cheap, and to be cheap, they must be simple in construction. These last have the further advantage of not easily getting out of order. It is the same with guns and ships. China should buy no more big guns to defend her coasts. Mortars will serve her turn much better. If she buys one 18-ton gun, she will find that she cannot pierce the sides of her enemy's ships; whereas she can get five hundred mortars for the same money, and the shot, if it hits the enemy's ship at all, falls on the deck, where it does a great deal of damage. A port which is defended by abundance of mortars and abundance of torpedoes is practically impregnable. In the same way, Colonel GORDON is in favour of small ships, as against large ones. Large ships are all very well in the open sea, but the open sea is not the place for China to show her strength in. It is to creeks that she ought to look as places where she may worry her enemy's ships in much the same way as that in which she worries his soldiers on land.

In one important respect, however, Colonel GORDON makes a distinction between the military and the naval policy of the Chinese. As regards the army, he is decidedly of opinion that China needs no foreigners to help her to carry out the programme he has sketched out for her. If she cannot do what he suggests for herself, no European can do it for her. The main object of the whole scheme is to bring out the peculiar military virtues of the Chinese people, and this is an object that can only be carried out properly by a native. Foreign interference would probably end in the adoption of a mixed system which would be neither European nor Chinese. As regards the fleet, however, Colonel GORDON speaks in quite a different tone. China must have European officers for her fleet, and Colonel GORDON makes two alternative suggestions as to the manner of obtaining them. Is it better, he asks, for China to get officers here and there, or to ask some one foreign Power to lend her officers? Each proposal has its disadvantages. If she gets her officers where she can, she may find herself at war with the country to which the officers of the fleet belong, and then many of them will have to leave her service just when she most wants them. If, on the other hand, she asks some one foreign Power to lend her officers, that foreign Power will be likely to interfere with her policy. It will be an ally who has the power of making its own terms for the assistance it gives. It is somewhat strange to find that Colonel GORDON decides in favour of this latter plan. The best and safest thing for China, he says, is "to think what nation there is who would "be likely to be good friends with China in good weather "and in bad weather, and then to ask that nation to lend "China the officers she wants for her fleet." The observation that naturally suggests itself at this point is that, if the Chinese Government really take Colonel GORDON's advice and determine to make some one nation their friend and to apply to it to officer their fleet, it may be a very serious consideration for this country. Such an arrangement as that here sketched out means nothing short of an alliance between China and some one European Power. If the Power chosen by China is England, it is easy to see how many things there will be to be said against such an offer being accepted. On the other hand, if the offer is made and declined, or if, in the first instance, it should be made to and accepted by some other Power than England, the position of England in the Eastern seas may be gravely affected. Of course the Chinese Government cannot be expected to trouble its head about these contingent annoyances to barbarian Powers, and Colonel GORDON has only done his duty by what may be almost called his second country in giving the advice which he honestly believes to be the best. But it is difficult not to wish either that he had read his duty differently, or that his advice were less likely to be followed by the Chinese. As it is, it seems so admirably suited to their capacity, and at the same time to their prejudices, and is so obviously disinterested on the part of Colonel GORDON, that there is a considerable chance of its being accepted. It would be interesting to know Colonel GORDON's opinion as to what answer England should give to the Chinese Government, supposing such a proposal to be made to her.

PAX GLADSTONIANA.

THREE Cabinet Councils in a week, resulting in a formal announcement to the effect that the Cabinet has not been able to make up its mind, represent a sufficiently curious state of things. It is a state, however, which cannot have been very surprising to hearers or readers of the now historical Guildhall speech. In that speech Mr. Gladstone, with many encouraging assurances as to what he would do when he and his colleagues awoke to the fact of there being something abnormal in the state of Ireland, declined very decidedly to awake at once to that fact. The Prime Minister is the sluggard of the poem dear to youth. When they told that sluggard that it was time to get up, he declined to anticipate the contingency; so does Mr. Gladstone. His slumber indeed may be said to be a restless one, for three Cabinet Councils in a week represent many turnings and tossings to and fro in bed. But, as far as definite acknowledgment of the situation goes, Mr. Gladstone and his Government are still in the attitude of the sluggard. The early summoning of Parliament is in their case the exact analogue to that terrible and shivering exchange of the warm blankets and coverlets for the chilly ambient air which many eloquent writers have described, and which millions of lazy mortals have contemplated with horror every winter. So they say "A little more sleep and a little more slumber," and refuse to anticipate the contingency which must take them out of their beds.

Meanwhile the condition of affairs in Ireland becomes every day more remarkably real when we remember that it is only a contingency, and more remarkably present when we remember that it is only an anticipation. By the time these lines are in print it is indeed possible that Captain Boycott's crops may have been got in. It is an inexpressible comfort, it seems, to Radical critics to think that the getting-in has been effected under the protection of "the law as it stands." "This," they cry—and we really are not travestying what has actually been said—"is

the country where you want the Habeas Corpus Act suspended. Is not Captain Boycott possessing his body—aye, and his soul and his crops, too—in peace, protected only by forty or fifty armed Orangemen, who are protected by some hundreds of Constabulary, who are protected by a battalion of foot and a regiment of horse?" This, it seems, is the "ordinary method" of enforcing the law in free countries. We are expressly told that policemen and soldiers are the "ordinary instruments" of the law. So they are, no doubt. But, in the first place, the metamorphoses of the Irish constable as he appears to the Radical eye are very puzzling to eyes which have not been purged with Radical euphrasy and democratic rue. At one time he is a "green soldier," a preposterous being whose rifle and revolver testify to the scandalous tyranny of England over Ireland. But at another time he is, it appears, "only a policeman," an ordinary instrument of the law, the same peaceful creature as the familiar blue-coated guardian of the London streets. It is good, too, to hear Radicals describing soldiers as the "ordinary" means for enforcing respect for the law. The ghosts of Cartwright and Paine, of Orator Hunt and Thelwall-of-the-pot-of-porter, must surely shriek and gibber somewhere in Elysium (or in the other place) at this doctrine, in the light of which Peterloo becomes as edifying a testimony to the completely satisfactory condition of England at the time as a co-operative festival or a Great Exhibition. For the times seem to have changed remarkably with Radicalism of late, and the obedient Radicals have changed with them.

However, the Boycott expedition is an old story now, and such lesson as it had to give to Mr. Gladstone and other people as to the wisdom of occasionally consenting to recognize facts, instead of refusing to anticipate contingencies, may be thought to have been exhausted long ago. The Special Correspondents have left Mayo and have journeyed to Clare. And this is what they find there, or at least what one of them finds, who is so little of a landlord-sympathizer that he once described the Boycott expedition as a "wrongheaded scheme." The Correspondent of the *Daily News* in Ireland paid a visit at the end of last week to Mr. Richard Stacpoole, of Edenvale, Clare. The condition of this Vale of Eden, in the land where the insufficiency of existing law is a contingency not to be anticipated, is remarkable. Mr. Stacpoole is a great landowner, and one of the landowners who might be thought to be the special darlings of the Irish. He lives at home and keeps up a great establishment; he hunts the county; and he races not merely at Punchestown, but on the English courses, and brings back glory and profit to Ireland. An ideal man for Galway, or for Clare either, the misguided reader may think. Not a bit of it. Before the visit which we are noticing the Irish telegrams showed that something was wrong with Mr. Stacpoole. His harriers have been interfered with; some, it was said, were poisoned, but this is not certain. Farmers have been threatened if they let the hunt ride over their lands. Of course there is nothing to account for this but the usual reason that Mr. Stacpoole (against whose conduct as a landlord we do not understand that anything is said) wishes to have his own. There is one thing of his own—his life—which, it seems, he would not have very long were it not for something else of his own—namely, his reputation for courage and presence of mind. He walks about with a big revolver, and a single, but trusty, bodyguard. The bodyguard has orders if his master is shot to leave him to die, if it must be so, but to kill the assassin at all hazards. Mr. Stacpoole himself is by no means disinclined in case of suspicious appearances to fire first. For there is a game at which the lead is of more importance even than in the game of piquet, and that is the game of shooting. The valiant tenantry of Clare have hitherto hesitated at the chance of being preliminarily shot by their landlord, and the almost certainty of being subsequently shot by his henchman. For, though the Land Leaguer is prodigal of other folks' lives, he has a great respect for his own. Mr. Stacpoole's method, therefore, though somewhat harassing, has been effective; but it is not surprising that the Correspondent of a Liberal journal should apparently accept the view that "there was no longer any law in Clare." The law as it is in Mr. Gladstone's view is sufficient. In that of eyewitnesses it is not sufficient, for the simple reason that it has, as a living and acting power, ceased to exist.

Now let us cross the island and come to Dublin. A letter in Tuesday's *Times* gives us a picture of a day's work in that capital of a peaceful land where the ordinary law is administered with such perfect efficacy that the contingency, &c. &c. &c. We presume that the Editor of the *Times* would not have inserted this letter without guarantees of its genuineness; but, as it happens, it really matters little whether it is an historic summary or only a clever collection of facts separately true. For that they are separately true there is evidence abundant and superabundant. The writer, then, who gives himself out as the Secretary apparently of an Insurance Company, informs us that in a single day his head office in London declined to advance any money on landed property in Ireland, or to allow insurance upon accidents; that insurance against fire in that country has to be underwritten by numerous offices, because no single one will take the risk; that a client had to be refused the insurance of his tenants' hay; that another applied to raise money to pay the charges on his estate, his rents having been withheld; and that a third applied for time to pay his own insurance premiums for the same cause. This is the country in which Mr. Charles Russell is cocksure that there is really no danger for landlords or anybody else; in which the sufficiency of the ordinary law for all purposes is the subject of Mr. Gladstone's continued and devoted belief; and in which Cabinet Ministers appear to be of the opinion that outrage, even if it does exist, has been grossly exaggerated. We hear a great deal of the anarchy of Macedonia and the neighbouring provinces. But it requires an acute logician to distinguish between Colonel Synge's position at Salonica a year ago and Mr. Stacpoole's in Clare to-day, nor do we think that property in Thessaly could be much more useless to its proprietor as regards the conveniences of civilized and legal arrangements than, according to this Dublin Secretary, property in Ireland is at the present moment.

The days of panoramas have rather gone by, otherwise a panorama (with real men, fire, pikes, &c. if possible) of Ireland as it is would be an instructive and exciting spectacle. Here we should have a gang of ruffians with blackened faces, waking up a publican after midnight, politely asking for "glasses round," and with equal politeness ascertaining that their host is a subscriber to the Land League before they depart. This case of the Wicklow publican Hunter is an excellent test case. In a country where the processes of ordinary law go on so smoothly as, on the best authority, we know that they do in Ireland, it is clear that Hunter committed a grave breach of that law in supplying liquor out of hours. He ought to be punished, therefore, for of course the idea of terrorism can enter into no one's head. Elsewhere we should have a mild Land Leaguer in a mask entering a house in the county of Cork by night, and wounding the sister of the occupier with a pike. This person (the Land Leaguer, not the woman) is pathetically described by his friends as being "in a most melancholy condition." In the next division of the panorama (we are only noticing cases reported in a single stretch of forty-eight hours), the patriots might be seen houghing ten cattle in Galway, and the artist (supposing the scene to be merely painted) would have an opportunity of showing his skill by depicting the sorrow which must have been expressed in the manly but blackened faces of the houghers when they found that they were "probably mistaken in the ownership of the cattle." Yet, again, a medical student proposes to "Boycott the police"—that is to say, to refuse fire and water to the energetic instruments of the ordinary law, which is nevertheless working with such admirable success. These things, with a view of the camp at Lough Mask, a sketch of Mr. Stacpoole strolling about with his revolver and his bodyguard, and a few more, would make an admirable "Adventures of Forty-eight Hours in a Country where the ordinary law is sufficient." It would be good, as we have said, as a panorama; better still perhaps as a Drury Lane spectacle. We shall charge no copyright fees to any enterprising manager who likes to embody it in his forthcoming pantomime.

How intelligent and superior persons like Mr. Boyd Kinnear are sure that it is "all the House of Lords"; how an unkind landlord of the name of Mahony has just demolished the assumptions of the more moderate friends of the Land Leaguers in England; and many other curious things relating to Ireland which have passed in the last week, we cannot stay to tell. It is sufficient for the present to point out the most striking facts which since last Saturday have shown how order reigns in Ireland, how the ordinary means of policemen and soldiers (applied, it is true, in rather large doses) are amply sufficient to secure the rights of individuals, and how the country at large is basking and sunning itself in that Peace of Mr. Gladstone which (the phrase cannot be said to savour of profanity, because it is absolutely the only one applicable) passeth all understanding.

STODDART AND TWEEDSIDE.

MR. THOMAS TOD STODDART, who died lately at Kelso, was the last of a great race of anglers. He had known the Border waters when there were but a few handmills at the now populous towns, Hawick, Peebles, Selkirk, and Galashiels, which fill the rivers with abominations literally of every dye. In Mr. Stoddart's youth trout were plentiful, and not very cautious. An angler so skilled as he was might have occasion to say, like Mr. Henderson, "the broom's in the basket"—that is, the basket was filled to the brim very early in the day. Those were years when the riparian landlords had not yet drained the hillsides with such unmerciful science that the streams run muddy white for a day after rain, and then subside in twenty-four hours to the shallow summer level. Even unskilled fishermen, angling down stream against all the directions of science, could hope to catch a few dozen yellow trout in water which was commonly of a dark porter-colour, refined to amber in the shallows. Mr. Stoddart was of the generation of Christopher North, who once walked fourteen miles to the place where he meant to begin angling, discovered that he had left his book of flies at home, walked back, returned again to the loch-side, and made his way home in the evening with two stone weight of trout in the creel on his back. In the thirties and forties of the century anglers were not numerous. Now every pool and stream has its fishers in the open Tweed water, while smaller rivers, like Ale, are systematically poached with nets. Mr. Stoddart's little book of Scottish fishing idyls (*Angling Reminiscences.* Edinburgh: 1837)) contains many pictures of the good sport that might be had forty years ago. Readers may remember his sketch of twilight-fishing in summer which it is almost irritating to read of in November weather, with some four months between us and the advent of the first March-brown. Night-fishing, when it is so dark that you cannot see the

flies, or the line, is often very successful in the Tweed. The angler is guided only by the senses of touch and hearing, as the big trout splash about his lure, and it is difficult enough, of course, to land trout in these circumstances. It is curious that Mr. Henderson, the author of one of the best modern works on fishing, *My Life as an Angler*, seems only to have tried night-fishing twice, by way of experiment. The experiment, to be sure, is not a comfortable, nor even a very safe, one, except when the angler lives by the very side of the stream, and knows every stone and bank and ledge as well as the blind fisherman of St. Boswell's. To that sportsman, of course, night is the most suitable season, for he is not vexed by the presence of rivals. It stands to reason that trout must often feed in the night, because in the daytime the most experienced anglers frequently find them sullen, and apparently surfeited. The very strangeness of night-fishing, the increased sound of the waters "deepening their voice with the deepening of the night," the shrill startling voices of night-birds, the appearance of shy animals that shun the day, make the sport worth trying in June weather, even though it has a certain air of poaching. As to the quantity of slaughter in the old times, Mr. Stoddart's account of a match between "Jack Leistor" and "Tom Otter" on one side, and "Mark Weir" and "Richard Heronbill" on the other, bears witness to something like butchery. The two former captured, with fly, in the Tweed, sixty-eight pounds of trout, the latter scored fifty-one. Except in such comparatively distant and unpoached waters as Loch Assynt or Loch Awe, in Sutherlandshire, we doubt whether such baskets of yellow trout could now be made in Northern lochs or streams. At the time when the "creeper" or undeveloped may-fly can be used as a bait, or in June with worm, in clear water, experts can still secure trout both numerous and large in Tweed, Yarrow, and the smaller waters which flow into St. Mary's Loch. But May and June, the seasons of large takes, are just the seasons when most people find it difficult to leave town. Holidays generally fall in August and September; the former is a bad month for trout-fishing; in the latter, though there are plenty of flies on the water, trout begin to fall out of condition, and the wader finds the rivers unpleasantly cold.

Mr. Stoddart was so fond of the Tweed that we may say of him what he says of his own "Tom Otter." "His attachment to Tweedside was altogether uncommon. The river seemed to him hallowed water. He revered its banks and channels, its tributaries, from their very sources, and all belonging to it." His enthusiasm took the shape of poetry which we cannot but think greatly superior to most of the verses written by anglers, a race whose love of song is out of all proportion to their skill in this accomplishment. Some of his verses are humorous, like the following piece, aimed at his enemies the landlords, who have sometimes shown an inclination to preserve the once free and public waters of Tweedside:—

> They've steekit the waters agen us, Jock,
> They've steekit the burnies and a';
> We hae na a chiel to befrien' us, Jock,
> Our laird's aye makin' the law.
> We'll neither get yellow nor grey-fin, Jock,
> Nor bull-heid, nor sawmon ava,
> The laird he's aye at the savin, Jock,
> And hauds to us weel wi' his law.

Fifty years ago the salmon pools of the lower Tweed, now let at very heavy rentals, might be fished by any one who could spare five shillings for the "tacks-man," and half-a-crown and a luncheon for the boatman. Times have altered; salmon-fishing in the Tweed is a luxury for dukes and Postmasters-General, and it is only on the tributaries that the angler without money in his purse can hope to have salmon, anything but clean run, in his basket. The lairds have usually been very generous in permitting all comers to fish for trout, but even here Mr. Stoddart must have noticed a "heavy change." The natives of the manufacturing towns are not disinclined to use nets, "rake-hooks," and other illegal instruments. Moreover, they swarm on the river-side in such crowds as to interfere with the privacy of owners of land. There is a constant political feud, too, between the Tory lairds and the manufacturing hands, so that many reasons combine to make the landlords preserve the trout-fishing, about which they used to be indifferent. Another Scotch song of Mr. Stoddart's bewails that curious phenomenon, the disappearance of the larger and lordlier trout from Yarrow. Even now, no manufactory pollutes the "silent stream that flows the dark hills under," and forty years ago scientific farming had not poisoned the fish with sheep-washing. But, for some unknown reason, perhaps because the lime of a fallen bridge had poisoned the water, the trout became scarce and poor:—

> The yellow fins o' Yarrow dale
> I kenna whar they've gane tae;
> Were ever troots in border vale
> Sae comely or sae dainty?
> Now he that angles Yarrow ower
> (Maun changes ever waken?),
> Frae our Lady's loch to Newark Tower,
> Will find the stream forsaken.

In a very different strain is this angling song, which perhaps would be best appreciated at an angling supper in the "Crook Inn," on the upper Tweed, or at "Tibby Shiels'," by Our Lady's Loch:—

> Bring the rod, the line, the reel!
> Bring, oh! bring the osier creel!
> Bring me flies of fifty kinds,
> Bring me showers, and clouds, and wind..
> All things right and tight,
> All things well and proper;
> Trailer red and bright,
> Dark and wily dropper;
> Casts of midges bring,
> Made of plover hackle,
> With a gaudy wing,
> And a cobweb tackle.

But, though the poet asks for "flies of fifty kinds," the angler knew better. Flies black, red, and dun, varying in size with the weather and state of the water, are all that one needs on the Tweed. Mr. Stoddart says as much in an excessively vernacular lyric, intended for Tweedside anglers, "*et non autres*," as Rabelais has it:—

> Wee dour-lookin huiks are the thing
> Moose body and laverock wing;
> There's mony a chield ta'en ane
> Wi mauk or wi mennin,
> But the flee answers best in the spring.

The border rivers are the ancient homes of poetry, since True Thomas left Leader Water for the streams of Fairyland, since the Bard of Rule was slain by a minstrel's sword, since the dying knight's blood reddened the Douglas burn, and Cockburn's widow bewailed her outlaw lord, and a slain lover was sought by his lady in vain, near the Dowie Dens of Yarrow. Great poets of later days, Wordsworth and Scott, have "plucked the reed and watched it floating down the Tweed," or have rhymed on the charm of Yarrow, visited or unvisited. Hogg, too, left songs that have not lost all their charm—Hogg of whom Mr. Stoddart wrote, in a sonnet on anglers—

> Ah, *one* I gaze on in the fancied band,
> Unlike the rest in years, in gait, in hue,
> Uprisen from a dim and shadowy land.
> Ask what loved phantom fixes my regard,
> Yarrow's late pride, the Angler, Shepherd, Bard.

The whole border country is haunted by echoes of song and memories of poets, yet the angler as he works his way up from Clovenfords, past Ashestiel to the Crook, while he forgets not Scott's, will remember Stoddart's verses,—

> The lonesome Tala and the Lyne,
> And Manor wi' its mountain rills,
> And Etterick, whose waters twine
> Wi' Yarrow frae the forest hills,
> And Gala too, and Teviot bright,
> And many a stream of playful speed,
> Their kindred valleys all unite
> Among the braes of bonnie Tweed.

The "Teviot bright" is now of the brightness of slightly diluted ink, thanks to the enterprise of the Hawick millowners. But the Tweed still survives, not wholly defiled by human greed, and, in spring, the angler pent in towns may say, with Mr. Stoddart,

> The voice of the city, the whisper of men,
> I hear them, and hate them, and weary again
> For the lull of the streams, the breath of the brae,
> Brought down in a morning of May.

He prophesied of his own end, and its consolations, forty years ago:—

> And I, when to breathe is a burden, and joy
> Forgets me, and life is no longer the boy,
> On the labouring staff, and the tremulous knee,
> Will wander, bright river, to thee!
>
> And the hymn of the furze, when the dew-pearls are shed,
> And the old sacred tones of thy musical bed,
> Will close, as the last mortal moments depart,
> The golden gates of the heart!

An angler's dirge, by the same angler poet, is more appropriate now:—

> Sorrow, sorrow, speed away
> To our angler's quiet mound,
> With the old pilgrim, twilight grey,
> Enter thou the holy ground;
> There he sleeps, whose heart was twined
> With wild stream and wandering burn,
> Wooer of the western wind,
> Watcher of the April morn!

THE BATTLE OF THE BELLS.

WHY is it that the subject of bells can never be introduced in public without the certainty of a fight? Matter-of-fact persons may reply that it is because campanology is one of the numerous subjects to which Sir Edmund Beckett does the honour of knowing them, and because, when Sir Edmund Beckett makes his appearance, it is a moral impossibility that there should not shortly be "wigs on the green." This is a gross and material explanation, and we decline to pledge ourselves to it. Very possibly it is the revenge of the Powers of the Air for the discomfiture which, as is well known, bells inflict upon them. Driven from the neighbourhood of those instruments, they take refuge in the heads and hearts of the persons who write and talk about bells, and provoke them to mortal combat. Yet another explanation (this time once more of the commonplace sort) is that all kinds of music have the power either to charm or to irritate the hearer in a remarkable degree, and bell music more than any others. There are some people, nervous and irritable enough in the matter of other sounds, to whom bell-ringing, unless the bells are in absolutely stunning proximity, is rather a soothing than a disturbing noise. Indeed, habit, if nothing else, must produce this result on all but

a very few unhappy persons, if they happen to have been educated at either of the English Universities, and especially at Oxford. What with chapel bells by the score in the morning, bells striking the hours and quarters with such a noble independence of Greenwich or any other arbitrary standard that not one minute of the sixty is quite silent, chapel bells again in the evening, chimes rung in honour of new Fellows or Scholars at odd times throughout the day, and the hundred booms of Tom to finish up with, a very few months' experience of Oxford makes a man as indifferent, to say no more, to the sound as a boilermaker is to the clank of hammer and rivet. But everybody has acquaintances who regard bells with an abhorrence almost equal to their abhorrence of bagpipes. They may perhaps confess that a distant peal, heard over half a league of wood and meadow, is not bad; but the admission has to be suspected of the same hypocrisy which makes a Scotchman eulogize the music of the pipes "far down the glen." The expression is poetical; the meaning seems but too suggestive of the further the better. In crowded cities especially there is a curious objection to bells, though perhaps there is nothing which takes off the hideous oppressiveness of the modern street better than what Mr. Froude has well said to be the specially mediæval music of bells. A day or two ago, while a not dissimilar controversy was going on in London, a gentleman at Manchester complained piteously in one of the local papers of the ringing of a bell, though this was on Sunday and for service. "Could any one," said this indignant person, "produce a single text of Scripture authorizing or ordaining the use of bells?" The challenge, we believe, remained unanswered; which, considering the date usually assigned to the composition of the sacred texts, and that assigned to the introduction of bells into the church service, does not surprise us.

The actual battle began on this wise. The Dean and Chapter of St. Paul's have laid their heads and their purses together, and with one accord desire a big bell. They have got a peal, and they have a bell of the bigness of five tons, or thereabouts; but this is not supposed to be sufficient for the dignity of the Chapter, or the Cathedral, or the capital. Canon Gregory, who has made himself the mouthpiece of the project, aims at twelve tons. This, it is true, would still lag behind, not merely the famous Continental bells, but also Big Ben the unfortunate. But it would far outweigh the Toms of Oxford and of Lincoln (Harry of Canterbury is but an infant, though an aged one), and it would outstrip Peter of York sufficiently to correspond properly to the respective dignity of the two Lord Mayors. The inferiority to Westminster may be thought to be a graceful concession to the sister city. Besides, the unnamed bell, which is yet in the furnace of the future, must by courtesy be supposed to be without a flaw, and a flawless bell of twelve tons can certainly make more noise than a flawed one (if it be flawed) of fourteen. It was this same flaw, however, that really developed this present battle of the bells. Into this branch of the fight we absolutely decline to enter. The flaws of Big Ben are the subject of what used to be called in Scotland a "ganging plea," both in the literal and the metaphorical sense. Big Ben is the Schleswig-Holstein of matters campanological—a thing which, when the wise man hears of, he stops his ears and runs away swiftly. The main question is whether Canon Gregory's desire for a really big bell is to be gratified or not. If not, it is scarcely likely to be for want of money. Whether the resources of science are equal nowadays to the casting of a really good and large bell is one of the vexed questions (though the participle is hardly wanted, for all questions relating to bells are vexed) of the subject. But it seems that a bell of the desired bigness could be got for between two and three thousand pounds, and more than half the money is promised already. There is the tower ready; there is the peal to which a really big bell is, if not a necessary adjunct, at any rate a handsome appurtenance. As yet, however, rather cold water has been thrown on Canon Gregory and his bell. Even Sir Edmund Beckett, either out of fondness for "Ben" or from a natural desire to be in opposition, discountenances the idea. Two "Bens" summoning London to take note of the flight of time would, he thinks, be "an unnecessary competition of noises." Now it is to be noticed that in his original proposal Canon Gregory does not clearly indicate the destiny of the big bell. If it were to be merely struck mechanically with a hammer to note the hours, there would certainly be something of an unnecessary competition of noises. But if it were to be regularly rung, as Big Ben is not, the enthusiasm of the bell-lovers and the rage of the bell-haters within hearing of it would be very much increased, and it would have a *raison d'être* at once. A "Provincial Incumbent," who has written on the matter apparently with some knowledge, says that even the present five-tonner is not regularly rung, and suggests that quite enough noise could be got out of that. Here also Sir Edmund Beckett is in opposition. The five-tonner is a very bad five-tonner, he says; but, if it were recast and thickened (which it might be with the money promised), it might be made very good. So that there are three propositions before the world—the original proposition of the Chapter for a really big bell, the proposition of the "Provincial Incumbent" that more should be got out of the existing bell, and the proposition of Sir Edmund Beckett that the present bell should be recast and thickened. Perhaps we may add a fourth, which is, that things should be left as they are, though this proposition does not express any idea of our own on the subject.

We own to a very decided liking for bells. There is no sound, as has been already said, which seems so appropriate at once to the noises of the town and to the silence of the country, none which is so little of a disturbance as an accompaniment to business and so much of an assistance to dreamy idleness. It does not, like ordinary instrumental or vocal music, distract the attention of the writer; and the reader, to judge from our experience, reads all the more easily and pleasantly for it. The only occupation to which bells may be said to be something of a hindrance is conversation, and we fear that, as a general rule, the average voice of the bells is apt to be much better worth listening to than the average human cry, as the Laureate poetically calls it, or, to put it less amiably, the average human chatter. There is, moreover, a certain appropriateness in the completion of this part of the apparatus of the City Cathedral at the present time. Lord Beaconsfield has just to'd us that London is a much less dull place than he can remember it as being forty or fifty years ago; it is only fair to add that it is, on the whole, a less hideous place and perhaps a less noisy one. The improvements which have been introduced all round St. Paul's are not altogether according to knowledge, and they have swept away not a few things that are much to be regretted. But at any rate the Embankment and some other novelties approach the ideal of the ornaments of a great city somewhat nearer than the average architectural features of the same localities did half a century, or even a quarter of a century, ago. Far be it from us to speak with unmixed commendation of wood and asphalte pavement and of underground railways. But the former have at any rate reduced what was at one time the intolerable roar of the streets to a gentler key, capable of being pleasantly dominated by bell music; and the latter have so far cleared the pavements that it is possible to walk in a contemplative manner without having some one's boot on one's corns and some one's elbow in one's ribs every second. There could be worse accompaniments to the river view from the Embankment on a winter night or in an autumn sunset than the peal of the bells of St. Paul's, duly interluded with solo discourse either from Canon Gregory's big bell, or from a bell of such different bigness as the wisdom of campanologists may determine upon and the skill of bell-founders construct. But then we must agree with the "Provincial Incumbent" that the bells, and particularly the bell, must be used according to knowledge. In the words of the famous jingle, it is necessary for the *clocha clochabilis* to *clochare clochative*, and not merely to boom antagonistically to Benjamin in what Sir Edmund Beckett, whose competence in this particular department is not deniable, appropriately calls a competition of noises. Whatever Sir Edmund does or does not know, a competition of noises is a thing in which he is an expert.

Much more battle may be expected on the subject of this unborn bell, even if his unfortunate, though actually existing rival should be kept out of the memorial. His voice is obviously not anticipated with pleasure in Printing House Square, which is indeed sufficiently near his cradle. All the bell-founders will fight for the honour of ushering him into the world; and, when this fight is over, all the unsuccessful bell-founders and their literary friends will not for some time be tired of discovering his infantine defects, and of asserting how much better they could have done it. His name, as in the case of other infants, will be a matter of fierce controversy. No one knows why "Tom" should have been twice selected for great bells, despite the tremendous sentence passed by Dryden on the name. Indeed, Tom of Oxford is said to have been christened Mary, and how the metamorphosis of names and sexes was effected is a mystery. Southey's suggestion of Peter as an obvious accompaniment to Bell has been carried out at York, though the reference may be presumed to be rather to the local saint than to the author of the *Excursion*. But quite enough familiar names remain to furnish materials for the controversy. After all, the bell is at present only half subscribed for and not half decided upon, so it may be premature to consider these matters. Let us hope that, if he ever comes into existence, he will not be cracked, will not bring the tower about the ears of the women's tailors in St. Paul's Churchyard, will not drive any industrious apprentice to suicide or bad courses, owing to an incapacity of concentrating his attention on the columns of his ledger, and will keep in tune and time, and all other things which a good bell should keep in.

THE GENEVAN BIBLE WITH TOMSON'S NEW TESTAMENT.

We resume the history of Laurence Tomson's version of the New Testament (see *Saturday Review*, November 6, 1880) at the point when it was first annexed to the Genevan Old Testament. For eleven years, from 1576 to 1587 inclusive, it had been printed eight times in a separate form; and it must have been owing to its growing popularity that the idea suggested itself to the publisher to issue this translation as part of the quarto Genevan Bible in place of the older version of 1560. And here it is necessary to caution our readers against a mistake made by Lea Wilson in calling the folios of 1576 and 1577 Tomson's. This mistake has been copied in the new edition of Lowndes. We have seen these books, and they are both pure Genevans.

As we have formerly seen, the popularity of the book could scarcely have been owing to any changes introduced in the text, which were such as would scarcely have been noticed. It must, therefore, be attributed to the notes, which, as has been said, were entirely different from, and much more numerous than, those in the New Testament of the old Genevan translation. It was in the year

1587 that the first edition of this amalgamation appeared, and the same printer's name appears in all the editions which were published—and that in about equal numbers of the old and new form, the number of Tomson's being somewhat greater than that of the others, till both at once and finally ceased.

These two sets of editions, such at least as were issued in a quarto form, are easily distinguished from each other, as the Genevans pure are all of them in black letter, whereas the Tomsons are in Roman character. The pure Genevans also have no embellishments, whilst those with Tomson's New Testament have several woodcuts inserted on the pages, somewhat capriciously, as whole parts of the Old Testament are without them, and others have several inserted on a single sheet with descriptions annexed to them. The Genevan-Tomsons have also a curious table of the prohibitions of marriage arranged in two parallel columns at Levit. xviii. 6—one of consanguinity, the other of affinity—taken from the Bishops' Bible of 1568. The headings at the top of the pages seldom vary from the Genevan except by a few unimportant changes or omissions. But amongst these omissions is not *The inconvenience of dauncing*, which figures over the head of the chapter of St. Mark which describes the death of St. John Baptist. The woodcuts very nearly resemble those of the edition printed at Geneva by Crispin in 1568. Again, all the pure Genevans printed in England from 1579 forwards contain the Summary and the Questions, but these do not appear in any of the Tomsons. We speak thus positively because Mr. Francis Fry of Bristol has examined all the copies of these works, amounting to one hundred and thirty-five, which are in his possession, for the special purpose of ascertaining these points for us, and his accuracy is entirely to be relied on. In all these editions the whole text and notes of Tomson's version were incorporated, even the distinction of type between the notes which are Beza's, and those which are not selected from his Latin translation, being constantly preserved; Beza's notes being in Roman, the others, which are interspersed with them, being in italic, type. It is to these notes of Beza's in all probability that the Tomsons owed their superior popularity to the Genevans proper.

We gave in our recent article on "The Breeches Bible" a specimen of some of the notes illustrative of the general Calvinistic tone of the volume. It must not be supposed, however, that the notes were all of this character. On the contrary, the great majority of them were simply explanatory, and had no direct reference to doctrine, and even those which were doctrinal were not apparently written in a controversial spirit. They merely took for granted that their readers were Calvinists, and explanations of hard passages were made upon that hypothesis, and seem to fit naturally into their places. In Beza's Latin version, however, the notes are distinctly controversial, and so is the selection from them which was made and translated by Laurence Tomson; and the probable intention was to educate people in Calvinistic doctrine, and to supply them with answers to objections which might be urged against it. A good instance of this contrast is supplied in the respective notes of the two editions to the verse 1 Cor. ix. 27:—

> But I beate down my body and bring it into subjection, least by any meanes after that I have preached to others I myselfe should be reproved.

Here the use of the word *reproved* as a rendering of ἀδόκιμος, instead of *reprobate*, has been fairly characterized by Dr. Eadie as a cowardly version. The note appended by the translators is as follows:—

> Lest he should be reproved of men, when they should see him doe contrarie, or contemne that thing which he taught others to do.

The note in Tomson's edition is as follows:—

> The word *Reproved* is not set as contrary to the word *Elect*, but as contrary to the word *Approved* when we see one by experience not to be such an one as he ought to be.

The same unmitigated Calvinism appears throughout the whole of the volume. Thus, on Romans ix. 20, we have the following:—

> The apostle doth not answer that it is not God's will, or that God doth not either reject or elect according to his pleasure, which thing the wicked call blasphemy, but he rather granteth his adversary both the antecedents, to wit, that it is God's will and that it must of necessity so fall out, yet he denieth that God is therefore to be thought an unjust revenger of the wicked: for, seeing it appeareth by manifest proof that this is the will of God and his doing, what impudence is it for man, which is but dust and ashes, to dispute with God and as it were to call him into judgment! Now, if any man say that this doubt is not so dissolved, I answer that there is no surer demonstration in any matter, because it is grounded upon this principle—That the will of God is the rule of righteousness.

In like manner, in the same chapter, the Genevan version has only the following brief explanation of the 15th verse:—

> As the onely will and purpose of God is the chiefe cause of election and reprobation: so his free mercy in Christ is an inferior cause of salvation and the hardening of the heart an inferior cause of damnation.

Of course it would be impossible to express the doctrine intended in more definite language. It is short, but distinct; whereas the notes in this chapter, defending the same doctrine, in Tomson's edition run to a great length. We shall extract only one as a specimen; it is on verse 17:—

> Now he answereth concerning the reprobate or them whom God hateth being not yet borne, and hath appointed to destruction without any respect of unworthiness. And first of all he [illegible] testimony of God himself touching Pharao, whom he stirred up to this purpose that he might be glorified in his hardening and just punishing.

We need not quote any further specimens in illustration of this point. Any one who wishes to verify it for himself may easily find much more to the same purpose in any of the numerous editions of this Bible which were issued between 1587 and 1598. They all exactly resemble each other. But in this latter year a curious change was introduced, evidently with the view of creating in people's minds a greater abhorrence of Popery. In this year there was an edition published, of which the Old Testament is dated 1598 and the New 1597, in which, at the end of the book, between the last page of the Revelation and the "Brief Table" which usually follows, are inserted 22 pages of another translation of the Revelation, with copious annotations by Franciscus Junius. It seems to have been an afterthought, for no notice is taken of this on the title-page, and the catchword—*A Briefe*—is on the preceding page, evidently showing that the Brief Table was meant to follow immediately. Nevertheless, this version must have been printed in the form in which it appears, in order to match the Tomson quarto Bibles. This version is sometimes met with separately. It never had a title, but consists of 24 pages, the last page being vacant, and p. 23 with a colophon, "Imprinted at London by Richard Field for Robert Dexter, dwelling in Paules Churcu-yard at the signe of the Brasen serpent. 1594." It is headed, "The Revelation of Saint John the Apostle and Evangelist with a briefe and learned Commentarie, Written by *Franc. Junius*," &c. The translation varies almost in every verse from any known version, and was made with the help of Beza's Latin text, the translator using his own discretion as to variations. He appears to stick closer to Beza than either the Genevans or Tomsons do. The notes are very numerous, those of Beza and others being printed first, in italics, and followed by those of F. Junius, in Roman type, translated from those which were printed in Latin in the revision of the Bible by Tremellius and Junius. The references to the notes of Beza are by means of letters—(*a*), (*b*), (*c*), &c.—and those to F. Junius's notes are by figures—1, 2, 3, &c.—with F. Junius printed at the commencement of each chapter to distinguish them; just as in Beza's Latin version, as published by Tremellius and Junius, they are headed by the letter F. The New Testament of this Latin version was preceded by a dedication addressed to Walsingham by Junius, dated at Heidelberg, 1589, and was first published in an English translation in 1592. It is remarkable that this version was again inserted in the edition of 1601, and not, as far as we know, afterwards, though the notes were from this time forward adopted in the editions which appeared subsequently, and from 1601 onwards the title-pages of these quartos specify this addition in the words *Together with the Annotations of Fr. Junius upon the revelation of* S. JOHN. These editions contain precisely the same notes as appeared in the separate issue of Junius on the Revelation, but they are arranged in different order, those of Beza being interspersed with those of Junius, and being distinguished by the letters of reference, though not always, as they ought to have been, by the difference of type.

The notes of Junius differ entirely from those of the Genevan version, though their *animus* as against Rome is pretty much the same. If the earlier Genevans speak of the locusts in Rev. ix. 3 as representing "false teachers, heretikes, and worldly subtil prelates, with monkes, friers, cardinals, patriarkes, archbishops, bishops, doctours, bachelers, and masters which forsake Christ to mainteyne false doctrine," this edition by Tomson comments on the next verse as follows:—

> Here that power of the devils is particularly described according to their actions and the effectes of the same. Their actions are sayed to be bounded by the counsell of God, both because they hurt not all men, but onely the reprobate (for the godly and elect in whome there is any part of a better life God gardeth by his decree) whom Christ shall not have sealed in this verse; and also because they neither had all power nor at all times, &c. The time is for five monethes or for an hundred and fiftie dayes, that is, for so manie yeares in which the devils have indeed mightely perverted all things in the world, &c. Now this space is to be accounted from the end of that thousand yeares mentioned chap. xx. 3, and that is from the Popedome of that Gregorie the seventh a most monstrous Necromancer who before was called Hildebrandus Senensis; for this man being made altogether of impiety and wickednesse, as a slave of the devill whom he served was the most wicked firebrand of the world, &c.

The best idea, however, of the tone of the whole notes and paraphrase may be gained from the page prefixed to the Revelation in the editions of 1599 and subsequent issues. It professes to give "The order of time whereunto the Contents of this booke are to be referred." The following is a fair specimen:—

> The yeere of Christ 1217. The Dragon vexeth the world 150 yeeres unto Gregory the IX. who writ the Decretals and most cruelly persecuted the Emperour Frederick the second.
>
> 1295. The dragon killeth the Prophets after 1260 yeeres when Boniface the viij. was Pope who was the authour of the sixt booke of the Decretals; hee excommunicated Philip the French King.

And the minutest details are made to fit into the general exposition given. Thus the note on the word *scarlet* in Rev. xvii. 4 is as follows:—

> A skarlet colour, that is with a red and purple garment, and surely it was not without cause that the Romish clergie were so much delighted with this colour.

Another singularity in the editions of 1599 is that they omit the Apocrypha for the first time since the Bible had been printed in English. There are fourteen different editions of this date, and every one of them omits it, though it is specified in the List of Books. All the succeeding quartos have the Apocrypha, as also have the editions of the Genevan proper printed in England in folio, quarto, and octavo. We cannot explain this fact; but it looks like an

unsuccessful attempt at the end of the sixteenth century to get rid of the Apocrypha from the English Bible. And it is worth noticing that the folio edition of the Genevan Bible, published at Amsterdam in 1640, omits the Apocrypha, substituting two leaves for it which contain an admonition of the Synod of Dort explaining why it is left out.

As regards the comparative popularity of the two works, the Genevan proper and the Genevan-Tomson, it is difficult to pronounce. The quarto editions which have notes are in numbers nearly equal, running over the whole period of forty years, from 1576 to 1616. But it is remarkable that the preference seems to have been given to Tomson's revised text of the New Testament when it was printed without the notes. Thus, of twenty-eight editions, exclusive of Whittingham's of 1557, only two are Genevans proper, and about half of them are without notes; whilst of those in a folio form Tomson's altogether supplanted the other after 1592. After 1611 the Authorized Version at present in use distanced all competition, there having been as many as thirty-nine different editions of the whole Bible or of the New Testament in ten years, up to 1620 inclusive.

And now for a few words on the historical aspect of the case. During the Primacy of Matthew Parker little seems to have been done beyond attempts to enforce an outward conformity to rule, and the state of things of which the Queen complained in November 1569, that people did not go to church or receive the sacraments, was probably worse at the accession of Grindal to the see of Canterbury. The Council had said that of this state of things "no one cause was more manifest than an universal oversight and negligence of the Bishops." It is evident that Grindal was anxious to promote a revival of religion after a Puritan fashion, as is manifested by his defence of "the Exercises," which led to his suspension by the Queen. And it was quite at the beginning of his Primacy, and probably under his auspices, that two nearly simultaneous attempts were made to disseminate Calvinistic doctrines by means of the Bibles commonly used in families. Thus, in the first year of his Primacy, Tomson, under the patronage of Walsingham, that great abettor of Puritanism, sent forth his New Testament, and three years afterwards the Calvinistic Questions were added to the editions of the Genevan Bible. This was done probably with the sanction of Leicester, for in the year preceding he had paid a visit as Chancellor of the University to Oxford, and in the same year, with the first issue of the Questions, that University had ordered the works of Calvin, Bullinger, and other treatises of the same school, to be used as text-books for the extirpation of heresy. Neither is it without significance that the folio edition of the Genevan Bible of 1578 was issued with an amended Prayer-Book, which forms part of the book, as the signatures at the bottom of the page show. In this Prayer-Book the word *Priest* in the few places of the Elizabethan Prayer-Book, in which it had been left, was altered into *Minister—i.e.* seven times in the Morning Prayer and eight times at Evensong. It also omits the Office of the Private Baptism of Infants and that for Confirmation.

Another indication of what was going on may be found in the insertion in the ordinary Genevan Bibles after 1579 of Robert F. Herrey's two Indices, the latter calling attention to doctrinal texts in such words as *election, predestination, &c.*, with a Preface to the Christian reader, dated December 22, 1578, in which the writer hopes that his readers and he may "bring forth such fruits as may declare our undoubted election in Christ Jesus." In this connexion it must be remembered also that Walsingham founded a new Lectureship on Theology in 1586, for the express purpose of widening the breach between Rome and England. In speaking of this, Antony Wood complains that from henceforth, owing to the efforts of Leicester and Walsingham, Oxford theology took a new form, as if there were a second reformation of the Reformed Religion in England. It is perhaps worth while to observe that P. Loseler Villerius, who figures on the title of Tomson's editions, was presented to a Doctor's degree by the University in the same year, 1576, in which his first edition was published. His real name was L'Oyseleur, Seigneur de Villers. Leicester lived on till 1588, and Walsingham till 1590, long enough to see their efforts crowned with success, and the Church of England, apparently hopelessly buried in Calvinism, and quite prepared to adopt the Lambeth Articles of 1595, sanctioned by both Archbishops and the Bishop of London, if the Queen had not peremptorily stopped them. This was the state of things from which the strong hand of Laud recovered the Church of England, and laid the foundations of all the changes subsequently introduced by the divines of the Savoy Conference.

OYSTERS.

THERE is no doubt that Tilburina was right, and that an oyster may be crossed in love. The present generation has indeed succeeded in crossing vast numbers of oysters in love, and very lamentable has the result been. The conditions necessary for the increase of the species have been interfered with, and the pleasures of love and the hope of posterity—to borrow an expression from Macaulay—denied to many an oyster. Owing to over-dredging and disregard of close time, the best liked of shell-fish cannot breed properly on our coasts, and in consequence there has been for some time past an oyster famine, which seems to grow worse and worse. Like cigars, oysters have become enormously dearer of late; and, unlike cigars, they are appreciated and liked by all. Dr. Richardson and other wise people, and a good many excellent people, think that it would be well for mankind if the supply of tobacco were to come to an end; but no human being, at least no rational human being, could think without the deepest pain of a total cessation of the supply of oysters.

Such a cessation, however, so far as regards the coasts of this country, seems only too likely. The increasing scarcity has long attracted attention, and four years ago a Committee of the House of Commons inquired into the condition of the Oyster Fisheries, and made in their Report a series of recommendations, some of which were carried out by legislation. These have had no beneficial result whatever. In spite of paternal government, oysters continue to diminish in number, and if the present rate of diminution continues, there will, before any very huge period has elapsed, be no natives at all. The causes of the failure of legislation and of this steady diminution are not hard to ascertain, and have been very clearly stated in a pamphlet on the Deterioration of Oyster and Trawl Fisheries in England (Elliot Stock) which appeared a few weeks ago, and seems scarcely to have met with the attention it deserved. It is the work of two writers, Mr. J. P. Hore and Mr. E. Gex. With the remarks of the latter, who speaks of the trawl fisheries, we do not propose at present to deal, as we wish to confine ourselves to the question of the oyster supply. Respecting this Mr. Hore has a good deal to say that is worth attention. He begins in the orthodox fashion by giving a short history, taken from original sources, of the oyster fisheries and of the measures taken to prevent the fishermen from over-dredging the beds. Our ancestors were even fonder of these shell-fish than we are, and indeed oysters formed no inconsiderable portion of the diet of Londoners three centuries ago. Very great, therefore, must have been the consternation felt when, early in the seventeenth century, they rose from *4d.* to *1s.* a bushel, defying the edict of a Lord Mayor of London who had settled for good what their value was to be. Mr. Hore refers to a proclamation made in 1418 by one Sevenoke, then Lord Mayor, fixing the price of oysters at *4d.* per bushel, and so long as the supply was plentiful, this seems to have been the regular price. After the lapse of two centuries the supply failed in part, and, all regulations to the contrary notwithstanding, the value of oysters rose, as has been stated, and continued to rise, until in 1634 they cost *8s.* a bushel—a terrible price, according to the ideas of the time. This rise, which was naturally viewed with extreme disgust by a generation of oyster-eaters, was attributed to the large exportation of shell-fish, in which "Flemings" were principally concerned. The Admiralty, which seems to have shared with the Lord Mayor a special jurisdiction over oysters, made ordinances prohibiting this trade, and from time to time efforts were made to enforce them; and so much alarm did the scarcity create that in 1637 the Council deemed it necessary to stimulate the zeal of the Lords of the Admiralty, and, in consequence, the most stringent orders were issued to Sir Henry Marten, the Judge of the Admiralty, and others to cause ships engaged in the trade to be stopped and to commit the owners to prison. All this appears to have been of no avail. Poor fishermen, for the sake of immediate gain, took the chance of imprisonment, and in many cases means were found to elude the regulations. The King issued special licences, giving permission to export oysters for the Queen of Bohemia and the Prince of Orange. His Majesty did not of course specify how many oysters these royal personages were likely to eat; and, under pretext of supplying their very remarkable appetites, large quantities were shipped, with the exportation of which even the Admiralty had no power to interfere.

Sir Henry Marten issued in 1638 a report to the Council on the scarcity of oysters, based on information obtained from "the vice-admirals of the countries of Essex and Kent," and the jurors at certain courts which had been held to investigate the question. This document, written in the quaint fashion of the time, Mr. Hore gives in full, and very instructive reading it certainly is to those who are interested in the matter. He attributes the scarcity of oysters to the reckless manner in which the fishing has been conducted, in order to meet the constantly increasing demand for London, and to supply the foreign market represented by the Queen of Bohemia, the Prince of Orange, "and theire household." To check an evil which is growing worse and worse, he suggests that the taking of young oysters shall be strictly forbidden, and that in the Essex fishories not more than "a thousand halfe barrels" shall be "barrelled upp in any one weeke." He further suggests that some limit shall be placed on the consumption of those royal devourers, the Queen and the Prince, who were fairly eating up the oyster supplies of a nation. How far the recommendations of Sir Henry Marten were carried out it is not easy to ascertain; but the question is comparatively unimportant. An indirect consequence of the great historical events which occurred shortly after the time of his report was most effectually to maintain and increase the supply of oysters. "During the Commonwealth," says Mr. Hore, "our natural oyster-beds enjoyed in a great measure the luxury of a jubilee, as, owing to our naval wars with the Dutch, the majority of the dredgers were impressed to man the Channel Fleet. This respite produced the most salutary effects; it gave our oyster-fisheries a chance to recover; so much so that sometime prior to the Restoration, the supplies became much more plentiful, if not absolutely abundant, and prices again returned to their minimum value." Mr. Hore is indeed an enthusiast with regard to his beloved shell-

fish, for he apparently does not consider the renewal of the supply as too dearly bought by a great war. "This happy state of affairs"—to wit plenty caused by war—"did not," he pathetically observes, "last long." Over-dredging, the taking of immature oysters, and the violation of close time recommenced with peace, and oysters again became scarce and dear. The bad system of fishing which caused this seems to have lasted for some time, but late in the century effectual measures were taken to put a stop to it. Restrictions were imposed on over-dredging, a strict observance of close time was enforced, and in consequence cheapness and abundance once more prevailed, and tavern-keepers and their customers were content.

With oysters, as with mankind, history repeats itself. Now, in the latter part of the nineteenth century, we have the same visitation which afflicted our ancestors. The object of Mr. Hore's historical chapters, of which we have given a brief sketch, is to show that the oyster famine of the seventeenth century was due to precisely the same causes as have produced that which now unhappily prevails. The great demand for the fish led fishermen to over-dredge, to clear out beds without leaving a sufficient reserve, and to fish in close time. The consequence was that the fisheries became barren. A huge demand, stimulating the greed of poor men who of course think only of the moment, has led in our own time to precisely similar results. The oyster grounds have grown more and more bare, and before very long we shall probably be dependent entirely on the foreign supply. How inferior foreign oysters, including even those from America, are to natives need hardly be said, and there is assuredly no need to point out how desirable it is that measures should be taken to prevent oysters from becoming extinct on our coast. As to what those measures should be there will probably be considerable difference of opinion. Those which have been taken up to the present time have proved useless, and it is clear that other and more stringent regulations are required. According to Mr. Hore, who is evidently well acquainted with the subject, "the maintenance of a sufficient parent stock in the natural beds" is the essential precaution which must be taken if a proper supply is to be kept up; and to the neglect of this, he says, the present depletion is due. Apparently the beds can only be maintained in a satisfactory state by keeping them stocked with the indigenous shell-fish. Foreign oysters have been relaid on parts of our coasts, but the oyster has, it seems, tastes and preferences like creatures of more complex development, and—whatever his mysterious method of breeding may be—he steadily declines to follow it in strange bays, or, at least if he does breed, his progeny refuse to remain in alien waters, and, in some manner not yet understood of man, take themselves off. With natives it is very different. "There is hardly an instance on record," says Mr. Hore, "where protection has been afforded to a native bed, even though it were sparsely stocked, that it did not gradually pick up, and, after being let alone for a few years, asserted its recuperation. It is therefore obvious that the best means to adopt with a view of replenishing our natural oyster-grounds, and restoring an exhausted fishery and making it a prosperous one, is to preserve inviolate the remnants of any stock which may happen to escape the ruthless destroyer; or, if that course be unattainable, to obtain supplies from grounds as near in geological features, depth, and temperature as the one it is intended to replenish."

What constitutes a parent stock, and how its preservation is to be enforced by law, are of course difficult questions; but it is better to grapple with difficult questions than to let natives disappear altogether, and a Government which has produced a Ground Game Bill, and has certainly no undue regard for vested rights, may well be asked to preserve oysters by some heroic legislation from indiscriminate destruction. Arguments have, it is true, been brought forward in favour of that unlimited dredging which leaves the ground almost bare; but, to show what their nature is, it is only necessary to refer to one of them. It has been alleged that, unless the beds are kept "clean" by constant dredging, the five-fingers, the whelks, the tunicles, and other objectionable creatures will destroy the oysters. In other words, unless the beds are cleaned by taking out of them all the oysters and parasites, the latter will prey on the former. Oysters are to be exterminated in order to exterminate the parasites. This remarkable view certainly resembles that of the parent who cut his little boy's head off to cure him of squinting; and it would be a waste of time to refute the arguments of those who are capable of committing themselves to such nonsense. That over-dredging, and especially dredging in close time, is one of the principal causes of the present scarcity seems beyond a doubt, and though there may be considerable difficulty in putting a stop to it, some effort should be made to preserve natives for the delight of rich and poor alike. A legislative measure on the subject would be acceptable to both parties, provided it were not timidly drawn. Tories would be gratified by legislation which resembled that of our ancestors, who, as has been shown, made several attempts to put a stop to the indiscriminate destruction of oysters; and Liberals would like the proposed law, as being high-handed and despotic. Another legislative measure, of a different kind, we will venture to suggest as a corollary to this one. In one respect a beneficial result might have been expected from the oyster famine. The raw oyster is infinitely superior to the raw mussel; but, on the other hand, the cooked mussel is, as the French found out long ago, very much better than the cooked oyster; and it was not perhaps too much to expect that, when oysters became very dear, English cooks would find out the merits of the mussel; but English cooks are a stubborn race. Might they not, however, be forced to learn? Might not the legislators who have said that under no circumstances whatever shall the landlord have the ground game say that under no circumstances shall oysters be cooked, and make dressing them punishable by fine and imprisonment? How much good would be the result of such a law! Excellent food hitherto neglected would be introduced at monotonous English tables, and the destruction of oysters would be necessarily to some extent checked.

THE SCOTCH BANKS.

THE three chartered Scotch banks—the Bank of Scotland, the Royal Bank of Scotland, and the British Linen Company—have just taken a step which it is to be hoped will lead to the general adoption of the limited liability principle by the banks north of the Tweed, and ultimately by those of the whole United Kingdom. The ruin inflicted upon so many families by the failure of the City of Glasgow Bank brought home in a startling fashion to the investing public the formidable risk attaching to the holding of shares in an unlimited bank. A single share, yielding, it might be, only ten or twelve, or, at the outside, twenty or twenty-five, pounds a year, exposed a man to the risk of losing everything he possessed in the world should the bank fail. Nay, worse, a trustee, who derived no benefit at all from the investment, or an executor, who at a great expenditure of time gave his attention to the winding-up the affairs of a deceased friend, was also exposed to ruin if a share in an unlimited bank happened to form part of the trust estate. It is quite clear that no sensible man would consent to act as trustee or executor on such terms; and it is equally clear that, to the prudent investor, the risk was out of proportion to the chance of gain. A deterioration of bank proprietary bodies was, therefore, foreseen to be the inevitable result of this state of the law. To prevent it Parliament passed an Act enabling banks to register as limited liability Companies. Several of the English banks at once availed themselves of this statute, and several Irish banks followed the example; but, strange to say, not a single Scotch bank has yet done so, though it was the failure of a Scotch bank, and the consequent suffering of Scotch shareholders, which induced the passing of the Act. The explanation is simple enough. The three older Scotch banks named above were founded by Royal Charter, just as the Bank of England was, and, like it, are limited in liability to the amount of their shares. And, as these shares are fully paid up, the total risk of an investor is measured exactly by the price he pays for his shares. The shares may cease to yield income, but nothing worse can happen to him. Yet, while this was so, the banks were not obliged to write the word "limited" after their names. If, however, any of the unlimited banks register under Sir S. Northcote's Act, they must write this word after their names; and they fear that this "ticketing" would place them at a disadvantage in the fierce competition they have to sustain. Every visitor to Scotland must have been struck by the intensity of that competition. Those, for example, who were attracted to Oban last summer by the splendour of the weather and the facilities for travelling afforded by the opening of the new line from Stirling, cannot have failed to notice that even in so small a place there are no fewer than four banks; and at Rothesay, if we remember rightly, there are three. The competition, therefore, not only at the great centres of industry, but at every point throughout the country, is intense. This competition can only be maintained by means of the deposits, and if the word "limited" should inspire ever so little distrust in the minds of depositors, the banks registering under the Act would find themselves at a great disadvantage in the struggle for existence. There is much force in this consideration, yet we venture to think it has been allowed too much weight in the minds of bank managers. If any bank had cause to fear a change, it was, one would say, the National Provincial Bank of England, which has to sustain the keen competition of London by means of deposits collected at its branches scattered all over the country. The rural population of England is less educated than the rural population of Scotland, and therefore less capable of understanding the transformation; yet the National Provincial has become limited, and, we believe we are justified in saying, without suffering from the change. It may be true that the National Provincial is not exposed to the same fierce competition as the Scotch banks; but we may point to the Irish banks which have registered, and which work under conditions very similar to those under which the Scotch banks work. Nevertheless the managers of the unlimited Scotch banks were unwilling to risk the consequences, and thus Sir S. Northcote's Act seemed to have failed utterly in Scotland. The chartered banks apparently did not need to make a change, and the unlimited would not. At length, however, the chartered banks have put an end to the deadlock.

We believe it is to the guiding spirit of the Royal Bank that the credit of the move is due. This bank has all the advantages of limited liability without needing to ticket itself with the word which so frightens its unlimited competitors, and people assumed, therefore, that it would rest content with its position. But its managers recognized clearly that its position is not in reality so strong as it looks. It has a large capital, it is admirably managed, its deposits are great, and it has all the prestige of antiquity. But its capital is fully paid up, and consequently the more its business grows the wider becomes the disproportion between its deposits and the

capital which is the security for their repayment. The unlimited banks, if they have confidence in their directors, may point to the case of the City of Glasgow Bank, and say to the depositors, It is not likely that such gross and criminal mismanagement will again be seen, but even in that case every creditor of the bank was paid, however the unfortunate shareholders may have suffered. With us, therefore, they may add, you have undoubted security. But with the chartered banks, where are you if the capital should chance to be fooled away? We have above suggested a criticism on this reasoning; but, so far as it affects the chartered banks, it is unanswerable. No institution is so strong that it is proof against every misfortune, and therefore in the long run the doubt would tell with the public. The management of the Royal Bank frankly recognized this, and it has been able to carry the two other banks with it in its proposals of change. Briefly, these are to ask Parliament for power to raise additional capital, which is to be issued in the form of new shares only part of which is to be called up, the remainder constituting a reserve capital, only callable in case the banks are wound up. It has been objected to these proposals that they are clumsy, that they create two distinct kinds of shares—one fully paid up, the other involving a large liability—and that this will cause confusion. The answer to this criticism is that probably nobody is more conscious of the clumsiness than the author of the proposal, but that he could not help himself. Sir S. Northcote's Act had for its object to remedy the evil brought to light by the Glasgow Bank failure; in other words, to enable unlimited Companies to become limited. It does not apply to the three chartered Banks at all; they cannot register under it, being already limited. They have, therefore, no option but to apply for a special Act of Parliament. As for the clumsiness, it is unavoidable. The Banks could not ask Parliament to tack a liability to shares which are now fully paid up, and therefore without liability. Even a shareholders' meeting could not propose such a thing; for women, infants, and absentees generally ought not to be subjected to a liability which did not attach to their shares when they bought or inherited them. The utmost that could be done would be to enable such shareholders as wished it to exchange old shares for new at some rate of exchange which would not be very easily determined. But in truth we fail to see the force of the objection. No doubt uniformity and simplicity are good things in the abstract, but in the actual work-a-day world variety and incongruity are often preferable. We know of no serious inconvenience that arises out of the fact that Railway Companies' capital consists of Preference, Ordinary, and often, also, of Deferred shares, except that when the latter is too small in amount it affords an opportunity for gambling. But the division of shares into three classes in itself is unobjectionable. Equally so is the division of bank shares into fully and partially paid. It will probably be found that the existing shareholders will subscribe for most of the new shares; but even if they do not, the extension of its connexion will be advantageous to the bank, and will be injurious to no one.

Some doubt has been expressed as to whether the chartered banks are willing to "ticket" themselves by assuming the word "limited", as part of their name. As the Bill or Bills embodying the proposals have not been made public, it is impossible to decide this point. But we assume that the banks are intelligent enough to know that, whether they like it or not, they must do so. Much pressure was put upon Sir S. Northcote to induce him to drop the word or to substitute some other for it, but in vain. It is true that a different Ministry is now in power; but we apprehend that in such a matter Mr. Gladstone would take the same view as his predecessor at the Exchequer. At any rate, whatever may be his private opinion, it seems impossible that he should make any exception in favour of the three chartered Scotch banks. The National Provincial, the London and Westminster, the London and County, the Royal Bank of Ireland, and several others have to tack the word after their names. So will the unlimited Scotch banks if they register under Sir S. Northcote's Act. It is impossible, when the chartered banks come to Parliament for a favour, that a privilege should be continued to them which they enjoy through an accident or through Royal favour. We assume, therefore, that the three chartered banks, in deciding for reserve liability, have made up their minds to adopt the word "limited"; and, if so, there will no longer be any obstacle in the way of the unlimited banks registering under Sir S. Northcote's Act. One or two of those banks, if we remember rightly, will hold their annual meetings just before Christmas, and much curiosity will be felt as to the course the directors may adopt. They may wait to see how the chartered banks' proposal will fare in Parliament: but, if they are wise, they will accept the inevitable, and recommend their shareholders to register under the Act. Whether they do so or not, however, the general adoption of limited liability cannot now be long postponed. One after another—in England, in Ireland, and now in Scotland—the principal banks are declaring in favour of it, and the others must follow. As regards the Scotch unlimited banks, there ought to be no difficulty, for they were all in favour of the principle of Sir S. Northcote's Bill, declaring only against the "ticketing" and against certain clauses which were dropped. Apart from the limitation of liability, two great advantages would follow were all the unlimited banks to register under the Act. They would all have to submit to a proper audit, and to publish balance-sheets. There are several banks doing a large business in all parts of the United Kingdom whose accounts have never been subjected to an independent audit; and there are not a few which have never published a balance-sheet. This state of things ought not to continue, and it would be brought to an end by universal registration under Sir S. Northcote's Act. As a matter of course, Parliament will take care that the chartered banks shall submit to an independent audit. They all publish balance-sheets.

THE THEATRES.

MR. EDWIN BOOTH has followed his performance of Hamlet at the Princess's by appearing as Richelieu in Lord Lytton's well-known play. His Hamlet showed that he had some of the highest dramatic qualities; but it failed, as every Hamlet must more or less fail, to please all his critics. It is a trite saying that every one has his own pet view of Hamlet; and, besides this, Mr. Booth's version of the part was in some respects curiously at variance with the views taken by the few actors who have within recent years played the character in London with any marked success. That the coldness displayed by the actor at some points in Hamlet where his audiences might have expected passion was, as we supposed, deliberate, is amply proved by the singular power of his Richelieu. In this respect the one part is strangely complementary to the other. The tenderness which was perhaps rather suggested than shown in Hamlet is strongly accented in Richelieu's scenes with Julie de Mortemar, and in the speeches which dwell upon his love for France; and it is in admirable contrast to the more frequent passages of irony, while the power exhibited in the celebrated speech of "the curse of Rome," and at other points to be presently noticed, can hardly be surpassed. While Mr. Booth gives their full meaning to the passages which show the less heroic aspects of the Cardinal's character, he never loses the dignity suggested at his first appearance, and strongly marked in the speech ending "The King must have no goddess but the State—the State—that's Richelieu!" The scene which follows close on this with Julie is, as we have hinted, full of an attractive tenderness; and the actor's manner as he discovers, by apparently careless questioning, Julie's love for Mauprat, is admirable. In fine contrast to this is the stern seriousness of his opening address to Mauprat; and this again is capitally set off by the humour of the mock sentence which he passes upon the prisoner as he sends him out, guarded by Huguet. The subsequent speech to Mauprat and Julie—"Go, my children; even *I* loved once! Be lovers while ye may!"—is charged with pathos, and the soliloquy which ends the act is given with true feeling and complete command. The second act contains, as will be remembered, the "business" with the two-handed sword which Richelieu used at La Rochelle and now tries vainly to wield, and the well-known lines which follow it—"Beneath the rule of men entirely great, the pen is mightier than the sword." At both these points Mr. Booth's acting was marked by a complete mastery of the science of gesture, and, on the occasion on which we were present, he overcame with singular readiness a difficulty caused by the probably accidental absence of the pen which, according to the stage direction, he lifts as he speaks the words. It is noteworthy that in this scene Mr. Booth, mindful no doubt of the line "Find him the suiting garments, Marion," causes François to appear in a black soutane, which he exchanges in the next act for a soldier's dress. At the end of the act Mr. Booth makes less of the somewhat clap-trap line about the "indomitable heart of Armand Richelieu" than he does of the concluding lines in which the Cardinal shakes off his momentary depression, and makes a sly hit at Joseph's ambition as the two leave the stage. The actor's performance in the third act is full of thought and skill. The courage triumphing over the sudden surprise of Mauprat's assault is admirably indicated, and the dignity of the rebuke, "To thy knees, and crawl for pardon," is overmastering; while a number of fine touches contribute to the effect of the stratagem which displays the Cardinal's ready resource in the midst of apparently insurmountable danger. The great scene of the fourth act is of course anxiously waited for and watched, and in this the power of Mr. Booth's performance, following and combined with the striking merits upon which we have already dwelt, cannot but stamp him as an actor of the highest mark. Nothing could well be finer than the preceding scene with the King and courtiers, and a strangely daring and effective touch is found in the wolf-like snarl with which Richelieu, overpowered for once by his conflicting emotions, turns on Baradas. The skill, the passion, and the power displayed throughout the act are so remarkable that the player might well be pardoned if something of an anti-climax were found, as in Mr. Booth's case it is not found, in the succeeding and last act, in which the Cardinal suddenly wakes from utter prostration to trample on the King's enemies and take up again the reins which have been wrested from him. There is nothing in the play to show clearly how far the author intended this prostration to be feigned, but it may be supposed that it was, at any rate, not wholly assumed; and Mr. Booth's acting suggests the notion that the Cardinal is, in fact, harassed nearly to death with anxiety and the chance of utter defeat, but has a reserve of power to draw upon in case of the victory which comes.

We have tried to give an idea of some of the more striking points in Mr. Booth's admirable performance, throughout which the beauty of his diction and delivery was remarkable. It would

be difficult, however, to give an adequate idea of the many fine touches which exhibit the actor's complete resource and knowledge of his art. As in the case of *Hamlet*, the stage management was excellent. It is Mr. Booth's misfortune that he is for the most part very ill supported. The performance of Mauprat, especially, might be "recommended to a friend" as a model of what to avoid. Miss Gerard's Julie is ineffective. Mr. Ryder's Joseph stands out as a thoroughly capable performance.

The Road to Ruin has been revived at Sadler's Wells, where Mr. Charles Warner appears in the part of young Dornton, a character in which he produced a strong impression some few years ago. His performance gives us a fuller notion of his strength as an actor than any in which we have before seen him. The emotion to be depicted in what are, as far as young Dornton is concerned, the capital scenes, is more complex than in the case of Claude Melnotte. The actor has to show a man who has strung himself up by the aid of wine to do a thing against which his whole nature revolts, to save his father from the ruin with which the son's extravagances threaten him. He is convinced that his marrying the rich widow is the only method in which he can atone for his past faults, and he has made up his mind to do it against every suggestion of what is really his better nature. In the scene of the half-drunken proposal, and in the one immediately preceding it, Mr. Warner's acting was at once admirably strong and admirably restrained. The suggestion of conflicting passions, working partly in consequence of and partly underneath the excitement caused by copious draughts of Burgundy, was as good as possible. The intoxication was marked, but never exaggerated; and the player commanded the sympathies of his audience throughout the scene. The capacity for giving a simple, direct, and strong interpretation of violent emotion, which we have before noted in Mr. Warner's acting, was exhibited in a marked degree; but he showed, in addition, that he could comprehend and render fully a complicated state of feeling, and could exercise a control over himself which is especially valuable in scenes where an actor of strongly emotional temperament may easily be tempted to excess. Mr. Warner's fault in other scenes of the play is that he applies the method, which is here of the greatest value, too indiscriminately to lines and passages which are overweighted by it. The frothy and bombastic sentiments put into the mouth of the paradoxically good-hearted rake, of whom countless prototypes exist in the history of comedy, assume even more falseness than naturally belongs to them when they are delivered with the air of thorough and earnest conviction which Mr. Warner gives to them. This is a fault which is well worth correcting in a performance of great merit, and which might, one would think, be corrected without much difficulty. Miss Isabel Bateman's performance of the heroine strikes one as the more meritorious because it follows closely upon her acting of the widely different part of Pauline in the *Lady of Lyons*. In the earlier scenes Miss Bateman is at once hoydenish and graceful; and in the pathetic passages there is little to find fault with except the same constraint of gesture which we have before noted. Mr. R. Lyons plays Goldfinch, which was, if we remember rightly, the great part of the piece in its early days, with much intention and vigour, and Mr. E. Lyons may be said, to borrow Dr. Johnson's enigmatical speech to Boswell regarding his election to "The Club," to "do what a man can" in the trying part of old Dornton.

Mr. Hollingshead's peculiar vein of humour has lately been exhibited in two instances; first, in his announcing the series of "revivals" which he gives with untiring energy on Wednesday afternoons as "educational matinées"; secondly, in the amusing collocation of press criticisms which he quotes in an advertisement of *Captain Cuttle*. The jest in the latter case is perhaps hardly worthy of Mr. Hollingshead's powers; for, considering the many dramatic performances, morning and evening, now given in London, and the many criticisms necessarily written upon them, it can be no hard matter to find a certain number of points as to which the critics are more or less at variance. The practical jokes of this kind in which the manager of the Gaiety from time to time indulges are not apt to have any offence in them; and in this case his quotations have for the most part little or no bearing upon what is of course the important point in the production criticized—namely, Mr. Florence's performance of Captain Cuttle in "a dramatic sketch" founded on *Dombey and Son*. That the manager himself sees any merit in the playwright's share in this business is hardly credible. That he and the audiences who go to his theatre should see merit in Mr. Florence's acting is natural enough. The American actor showed that he was thoroughly skilful, and had a strong sense of humour, by his performance of Bardwell Slote in a bad play, and perhaps shows it still more by his performance of Captain Cuttle in an even worse play. His rendering of pathos misses the true ring, but avoids condemnation. In the general interpretation of the character he has to meet the same kind of difficulties which beset the illustrator of a familiar book, and he gets over these difficulties, as well as those which arise from his being an American, with much success. Both in Bardwell Slote and in Captain Cuttle Mr. Florence has displayed, besides the merits which belong to a clever and thoroughly practised actor, that indefinable quality by which a player is enabled to create at once a sympathetic feeling between himself and his audience.

Mr. Toole appeared for the first time last Saturday afternoon in an "utter absurdity" written for him by Mr. Byron and called *The Light Fantastic*. No one knows better than Mr. Byron how to write a piece of this kind for Mr. Toole; and no one knows better how to play a piece of this kind than Mr. Toole. The airs and grimaces, the burlesque jealousy, and the burlesque libertinism of Mr. Slithery were very funny on the first production of the piece, and may probably become even more funny on future occasions. Perhaps the least humorous part of the performance is the song which is introduced much in the same way as a dance was introduced in the melodrama adapted from the French by Nicholas Nickleby for the Crummles company.

CLOSE OF THE RACING SEASON.

THE past racing season has been a remarkable one; but it will be chiefly connected in men's memories with the names of two horses—Robert the Devil and Bend Or. These horses had four notable contests, a private arbitration, and very nearly a law-suit, before their differences were settled; and, although Robert the Devil was eventually proved to be the better of the pair, Bend Or succeeded in winning the Derby. It was certainly an event in the history of the Turf that the Duke of Westminster should win the Derby; and it is a matter of satisfaction, when we look back on the past season, to reflect that the head of a family which has given such generous support to the Turf should have won the great prize of the year. The Duke of Beaufort, who had almost given up racing, won the Two Thousand Guineas; and Lord Falmouth had immense success with his two-year-old Bal Gal. We merely mention these names to show that great noblemen still take a pride in breeding and possessing racehorses of the highest class; and, as long as they do so, there will be an interest taken in racing by many people who never bet, and by not a few who never go to races. Turning our thoughts from these great personages to trainers and betting men, it is satisfactory to remember how honourably men of these professions who owned a well-known horse behaved under somewhat trying circumstances. We do not for a moment mean to imply that a betting man or a trainer would be more likely to behave dishonestly than a peer; but, when we consider how easy it is to win money on the Turf by questionable methods without absolutely infringing racing laws, we cannot help congratulating ourselves when we see men who professedly make their incomes by racing behaving in a straightforward manner, and refusing to avail themselves of any tempting opportunities of winning money unfairly.

We wish that reflections on racing matters could be altogether agreeable; but this, we fear, will never be the case. The end of the season seems a fitting time to make a few observations on a practice which, although no infringement of the rules of racing, we think it impossible to approve. When a man has two horses in a handicap, either of which could probably win, he may declare to win with either of the pair; and, when he has made such a declaration, he is allowed to have the horse which is not running to win pulled up in order to allow the other to pass it. Now this system may be all very well if acted on in a generous spirit; but in too many instances the following is the course of proceeding adopted. The owner waits quietly while the betting public back and lay against his horses. He watches their position in the market, and sends them both to the race meeting without giving any sign or intimation of his intentions with regard to them. Betting men probably know on public form which is the better horse of the pair, and back it accordingly, until it becomes a strong favourite. Now comes the owner's opportunity. He gets a commissioner to back the non-favourite, against which of course he is able to get a long price, and at the start he declares to win with him. Sometimes he scratches the favourite altogether. If the favourite starts, he is deliberately pulled in order to allow the other horse to win, without the least secrecy or shame. So long as the owner has declared to win with the non-favourite, he has not, technically speaking, committed a fraud. It is certainly desirable that, when an owner intends to win with the less fancied of two horses, he should make a declaration to that effect before the race; but that does not at all excuse the practice of virtually withdrawing a horse from a race which he could easily win, for the simple reason that his owner could not back him at long odds. It is contended in reply that a man does not keep racehorses to amuse other people, and that it would be unfair that the public should win money by a horse instead of his owner; but even if we allow considerable scope to this theory, it seems to us unfair, to use a mild term, that an owner should deliberately wait while people are backing his best horse until he is such a strong favourite that the other horse is proportionately low in the betting, and that he should then suddenly back the non-favourite for a large sum, and declare to win with him. We dwell on this point, because not only professional betting men and turfites, but also wealthy men, and sometimes men of high social position, resort to this practice without apparent shame. We do not intend to preach a sermon on the evils of horse-racing. There are malpractices connected with the Turf, such as pulling horses surreptitiously, which are universally condemned, although frequently resorted to; but the proceeding to which we have been objecting by no means meets with general condemnation, and that is our chief reason for noticing it.

In looking back on the past season we may as well notice the finest race of the year. This was the Astley Stakes for two-year-olds, at Lewes. It was not a very important race, but few closer finishes have ever been seen. Nine horses went to the post, and they went away to a capital start. When they were running up from the distance, five horses were abreast, and as they passed the

post, three of them ran a dead heat, the other pair, who ran a dead heat for second place, being only a head behind them. The three leading horses were Scobell, Wandering Nun, and Mazurka; the two others were Cumberland and Thora.

We need not notice the extraordinary ups and downs experienced by the favourites for the Liverpool Cup before the day of the race. At the start Toastmaster was the first favourite. He had won the Select Stakes at the Houghton Meeting, when long odds were laid against him, and he had beaten Mask, Valentino, and Poulet. Prestonpans was the second favourite. This horse had won the Criterion last year, and 6,000*l.* had afterwards been given for him, with the idea that he might win the Derby, but the death of his nominator had disqualified him for that race. Petronel, the winner of the Two Thousand, was another horse that was supposed to have a good chance. The three-year-old filly Experiment, who had shown some wonderful form, was another starter; so that altogether the quality of the field was decidedly good. A dozen horses went to the post. White Poppy, who has been singularly unsuccessful since she won the Corporation Stakes both at Brighton and at Doncaster two years ago, made the running. Victor Emmanuel, the winner of the Chesterfield Cup at Goodwood, followed her closely and took up the running in the straight, when White Poppy was beaten. Toastmaster then went up to him; but as they came up the straight the pair were beaten, and they resigned their places to Petronel and Philammon. But the last-named pair were not destined to have the race all to themselves, for Prestonpans came with a rush as they drew near the winning-post, and he won the race by half a length from Philammon, who was half a length in front of Petronel. Toastmaster and Victor Emmanuel were less than a length behind Petronel. It was a very pretty race.

After his victory at Liverpool it was expected that Prestonpans would be able to win the Great Shropshire Handicap at Shrewsbury. He was to carry 10 lbs. extra, and the course was very holding, but most people thought he would be able to win even under this weight. The Severn had overflowed its banks to an extent unusual even in midwinter floods, and there was snow on the Welsh hills. Still the early part of the afternoon on which the Shropshire Handicap was to be run was fine, and a great many people came to see the race. Prestonpans was looking very well, and it would have been difficult to find a fault with his make and shape. As he was led about the paddock he made the rest of the field look rather second-rate. The enormous Chirper, although too lumbering for racing, is a fine horse. Essayez, who shows some quality, is light and small. Young Duke and Velleda were the second favourites, and Essayez and Speculation were backed most after this pair; 10 to 1 was laid against The Chirper, and 20 to 1 against the queer-tempered hurdle-racer Misenus. Another runner was Sidonia, who had cost 2,000 guineas as a yearling. Although six years old, with only 7 st. 1 lb. on his back, his chance was only estimated at 20 to 1. The horses were very punctual at the post, and they were soon started. Misenus made the running, and he went as if it was one of his "going days." Young Duke was the first horse beaten, and he soon dropped into the rear. At the bend Speculation went up to Misenus, and the pair raced together on the left of the course, close to the rails. Prestonpans was on the right of the course, and as they entered the straight Fordham was sitting very still on him, as if waiting to make one of his well-known rushes. Some distance from the stand he roused his horse, but all to no purpose. The beast either would not or could not "rush," even in the hands of this scientific jockey. Meanwhile Misenus and Speculation were fighting out the race by themselves, and after a very pretty struggle, Misenus, the despised hurdle-racer, won by half a length. He ran for this race a year ago, but was unplaced. As much as 50 to 1 had been then laid against him, but a similar price had been also laid against the winner, Rosy Cross. The field on the late occasion was the smallest that ever ran for a Great Shropshire Handicap. The next morning the frost was so hard that the horses could not take their early canters. When the sun came out, however, the ground soon became soft, and the races were only delayed for about a quarter of an hour. For the Shrewsbury Cup, Rhidorroch, who had won this race last year, was made first favourite. The Star, who had been third to Robert the Devil and Cipolata for the Cesarewitch, was the second favourite. As soon as they were well away, The Star made the running for a short distance, but he was soon pulled back. Antient Pistol then took up the running, and maintained it until he was well into the straight. He now seemed to have the race at his mercy; but suddenly The Star made a tremendous rush, and, making up ground in a wonderful manner, reached Antient Pistol, and even got a trifle in front of him. A hard contest followed, in which Antient Pistol struggled with great gameness, and won by a head. Both the Great Shropshire Handicap and the Shrewsbury Cup were well-contested races, but the weather in which they were run was piercingly cold—cold enough indeed to make sensible people determine to go no more to races this year.

Once again the Middle Park Stud is to be sold, and in a fortnight breeders will have an opportunity of buying fifty mares, twenty-eight foals, and some half-dozen stallions. We have had occasion to notice the ups and down in the value of certain racehorses which have recently been sold. We may add that Maximilian, who cost 4,100 guineas as a yearling, was sold the week before last for exactly a tithe of that sum—that is to say, at a loss of 3,690 guineas. Gentlemen fond of giving large sums for horses may still, we believe, purchase Robert the Devil for 12,000 guineas. When we hear of these long prices we recall to our minds the fact that Parmesan, the sire of two successive Derby winners, was purchased for 60 guineas.

We may dismiss the subject of racing for this year by observing that St. Louis, the winner of the Middle Park Plate, has been established as first favourite for the ensuing Derby.

REVIEWS.

WALLACE'S ISLAND LIFE.*

In his recently published *Island Life* Mr. Wallace has given us a valuable supplement to his *Geographical Distribution of Animals*. Four years' additional thought and research upon the lines laid down in that suggestive work have brought to a completion the general scheme of inquiry which he from the first proposed to himself, and he now propounds, as a clear and definite theory, the results of investigations which might at first sight appear fragmentary and disconnected. Mr. Wallace has entitled himself to be called the father of the new science of zoological geography, showing that we have in the present distribution of living things over the earth's surface a key to the problem of the most ancient relations of land and water. The aggregation of existing faunas and floras in definite assemblages within certain areas is proved to be the direct result of a complex set of causes which may be grouped or classified as partly physical, partly biological. Starting from the general law of evolution, and regarding all the main types of animals and plants as having diverged from certain common centres, the author proceeds to trace the changes and modifications which they exhibit to the operation of the same causes through long ranges of time, and he points to these changes as in themselves an index to the primary laws which make up the constitution of nature. There may be laid down upon the globe, he remarks, certain well-defined zoological regions or provinces which indicate far more truly than the old geographical divisions the range and the history of animal existence upon the earth. The main divisions of land and water which constitute the great continental masses have undergone no essential change. The continents and oceans as they now exist have had throughout all geological time much the same general outline. There have been local changes here and there; elevations and depressions have taken place, altering coast lines, isolating portions of land, and drying up areas of water; but the general contour of the continents has remained the same. Great changes of climate have occurred in various regions, not due to any shifting of the earth's axis, or to extra-telluric influences of any kind, but, as Sir C. Lyell and all sober geologists have maintained, to local derangements of the surface, especially to changes in the distribution of land and water about the Polar regions. These altered conditions have largely influenced the dispersal of living organisms, and to them are to be traced the divisions or varieties of distribution exhibited by the animals and plants of our day. The first part of Mr. Wallace's book is occupied with this world-wide dispersal of organisms, its phenomena, laws, and causes. Of these agencies the most important have doubtless been such changes of climate as marked the extension of the ice-cap far beyond the present boundaries of the Arctic regions, and the contrary phenomenon of a milder range of temperatures prevailing towards the Pole. Our author discusses anew, with the aid of the latest evidence, the causes of glacial epochs, illustrating his arguments by the analogy of the planet Mars as most akin to our globe in relation to the sun. He is able to correct Mr. Croll's calculations of the effects of high excentricity, showing how far more influential have been geographical changes of the earth's surface. The last glacial epoch was the climax of a great process of continental development which had been going on throughout long geological ages. It was the direct consequence of the North Temperate and Polar land having attained a great extension and a considerable altitude just at a time when a phase of very high excentricity was coming on. Taking this period to coincide with the change from the Miocene to the Pliocene period, Mr. Wallace assigns to it a date of about 200,000 years before our era, the next preceding cycle of high excentricity and consequent ice-age, still falling within the Miocene, going back to 850,000 years. The present condition of the earth, beginning with the Pliocene, he looks upon as one of exceptional stability, and within it have been brought about those changes in the earth's flora and fauna which it is the object of the present work to bring under review. Enormous ranges of time, as well as vast and stupendous cataclysms or terrestrial convulsions, may be banished from the consideration of science.

With the physical proofs of the general permanence of continents and oceans Mr. Wallace combines the interesting evidence supplied by the distribution of living forms. He is able to map out six primary zoological provinces or divisions of the earth, which correspond in the main with the received continental boundaries, though exhibiting modifications in detail owing to

* *Island Life; or, the Phenomena and Causes of Insular Faunas and Floras, including a Revision and Attempted Solution of the Problem of Geological Climates.* By Alfred Russel Wallace, Author of the "Malay Archipelago," "Tropical Nature," &c. London: Macmillan & Co. 1880.

local geographical changes. The animal forms of Southern Africa, for instance, differ so widely from those of the Northern extremity of the continent, whilst those of the North approximate to those of Southern Europe, as to make it probable that a wide area of sea held at no distant geological period the place of the Sahara; Southern Africa thus forming a great separate island or geological province, with a flora and fauna of its own. Six such zoological divisions are to be traced out, Mr. Wallace considers, by comparative study of the living forms inhabiting them. 1. The Palæarctic, equivalent to Europe, with North Temperate Africa and Asia. 2. The Ethiopian, comprising Africa south of the Sahara, with Madagascar. 3. The Oriental—*i.e.* tropical Asia to the Philippines and Java. 4. The Australian, including the Pacific Islands, Moluccas, &c., New Zealand remaining doubtful. 5. The Nearctic, North America to Northern Mexico; and 6. The Neotropical, *i.e.* South America, with tropical North America and the West Indies. A map on Mercator's projection makes clear at a glance these zoological divisions, with their relation to the ordinary geographical regions. There are of course overlapping areas in which the flora and fauna have a partial community of character, and others which are discontinuous or isolated, wide gaps separating them from those of the neighbouring region. Of the higher animals, as the author shows, there are not many that have a world-wide distribution. Among the mammalia there is no such thing as a truly cosmopolitan genus. All the higher orders, for instance, except the mice, are absent from Australia, while the genus Mus, which occurs there, is represented by a distinct group, Hesperomys, in America. If the dingo of Australia be taken as a native animal, the genus Canis might be classed as cosmopolitan, but that the wild dogs of South America form, with some naturalists, a genus apart. Many genera, however, range over three or more continents, as Felis (the cat genus), absent only from Australia; Ursus (the bear genus), absent from Australia and tropical Africa; Cervus (the deer genus), with nearly the same range; and Sciurus (the squirrel genus), found in all the continents save Australia. The superior locomotive power of birds gives them scope for a wider range. Still there are among perching birds only Turdus, the thrush, and Hirundo, the swallow, which are truly cosmopolitan, though there are many genera of hawks, owls, wading and swimming birds, which have a world-wide range. Of isolated orders, the insectivora among the mammalia offer the most conspicuous example, several of their families inhabiting areas more or less apart from the rest, while the Marsupialia have six families in Australia, and one, the opossums, far off in America. Still more marked is the limitation of some entire orders to certain well-defined regions. Thus the Proboscidea, comprising the single family and genus of the elephants, and the Hyracoidea, that of the Hyrax or Syrian coney, are confined to parts of Africa and Asia; the marsupials to Australia and America; and the Monotremata, the lowest of all mammals, comprising the duck-billed Platypus and the spiny Echidna, to Australia. The Struthiones, or ostrich tribe of birds, are well-nigh limited to the three Southern continents—South America, Africa, and Australia; and among Amphibia, the tailed Batrachia—the newts and salamanders—are in like manner restricted to the Northern hemisphere.

From a wide range of observations of this kind Mr. Wallace works out the great lessons of his book. It is especially from the study of the oceanic and continental islands, treated in the second portion of the work, that the great problem of the distribution of life is made in his hands to receive its solution. For this study islands possess, as he points out, special advantages, since they have a restricted area and definite boundaries, and their geographical and geological limits as a rule coincide. The number of genera and species they contain is always much smaller than those of continents, and their peculiar species and groups are in general well defined and strictly limited in range. Islands have had two distinct modes of origin. They have either been broken off by some cause or other from continents, or have risen from the ocean by volcanic upheaval or coralline formation. The latter class are wholly without indigenous mammalia or amphibia, though abounding in birds and insects, with occasional reptiles. It has been very generally maintained that the Azores once formed part of the submerged continent Atlantis. But, were this so, the plants and animals of those islands would assuredly follow the type of those existing on the mainland of which they formed a part. Such, however, is by no means the case. There is no mammalian or amphibian form, and no lizard, snake-lizard, frog, or fresh-water fish. Flying creatures, birds, and insects abound; and there is also one flying mammal, a small European bat. Rabbits, weasels, rats and mice are believed to have been imported. Birds and insects have been borne thither either by their own wings or those of the wind. Land shells may have been easily transported by birds or floating wood, or their tiny eggs wafted over the sea by storms. Of the 69 known species, 37 are common to Europe, 32 being peculiar. Though allied to European types, many of them date back to beyond the Glacial epoch. The evidence brought together by Mr. Wallace, coupled with Mr. Darwin's interesting experiments, amply verifies the presumption that the seeds of plants of continental type here found may have been ferried over by ocean currents and winds. Now these islands are wholly of volcanic origin, with the exception of a single small one, Santa Maria, which exhibits some marine deposits of Upper Miocene age—a fact indicating some change of level, or wider extension of the land in earlier times, but not any connexion with the mainland, or former union with the rest of the group. It proves, moreover, the antiquity of the islands, and is of great weight in considering the origin and peculiar features of their fauna and flora. The other North Atlantic islands—Madeira, the Canaries, and the Cape de Verdes—present analogous phenomena, modified by their more southern position, their richer vegetation, and perhaps their greater antiquity. The Bermudas, a coralline group, stand in much the same relation to the American Continent as the Azores do to Europe. Here are no indigenous mammals, frogs, or snakes. Migratory birds flock hither in vast numbers, upwards of 180 species having been recorded. The Galapagos Islands, volcanic like the Azores, and equally destitute of indigenous mammalia and amphibia, differ from that group in many important respects. They lie not more than 600 miles from the west coast of South America, and some 700 from Veragua, within the belt of equinoxial calms. They are traversed, however, by strong and constant ocean currents, setting north-westwards from the coast of Peru. Without any indigenous mammals, they have a very peculiar series of birds and insects, including two species of large land tortoises which are wonderful swimmers and quite competent to have made their way from the mainland of South America. Two species of snakes may equally have made the passage by swimming, or by the aid of drift-wood. The Sandwich Islands, separated from the great continents by more than two thousand miles, and by ocean depths of three thousand fathoms, are connected in a measure with the other Pacific Islands by countless coral reefs and atolls. Volcanic mountains rise to a height of 14,000 feet. Indigenous mammals are here altogether unknown. The birds, which are fairly numerous and highly peculiar, exhibit on the whole affinities with Australian and Pacific types. Their marked specialty is suggestive of extreme antiquity, or of connexion with some very ancient land now submerged.

Coming to the British Isles, Mr. Wallace dwells upon the features which characterize continental as distinct from oceanic islands. To the same class belong Japan, Formosa, and the larger Malay Islands, especially Borneo, Java, and Celebes. As they are one of the most recently formed island groups, we have still amongst us, he shows, the material for highly instructive study of geographical distribution. The biological identity of Great Britain with continental Europe is by no means so distinct as is commonly supposed. Among birds, our author points to at least three undoubted peculiarities. Peculiar fishes are five times as numerous. Of mosses and Hepaticæ there are peculiar British forms. Many insects common with us have never been found on the Continent. The Shetland Islands, on the other hand, the Isle of Man, and the little Lundy Island, possess forms unknown to our principal island. Islands, the author remarks, form in all parts of the world a refuge for species or groups which have become extinct elsewhere. On the whole, however, the fauna and flora of Great Britain follow closely the Continental type, the special points of divergence supplying a fair approximate test of the interval of time that has elapsed since their separation. In Borneo and Java, which may be, Mr. Wallace thinks, not much more ancient than Great Britain, there is a considerable amount of specialty. The channel which parts these two islands is not more than fifty fathoms deep; while to the east they are separated from Celebes by a strait varying from 1,690 to 2,500 fathoms in depth. In geological structure Borneo is thoroughly continental, a character entirely in accordance with its fauna and flora. Of the ninety-six species of mammals discovered in the island, nearly two-thirds are identical with those of the surrounding countries, and nearly one-half with those of the mainland. Java, with many peculiarities, presents unmistakable relations with the Asiatic continent. A comprehensive survey of the whole Malayan group leads our author to the conclusion that the Philippines were the first to separate, then at a considerably later period Java, somewhat later Sumatra and Borneo, and finally the islands south of Singapore to Banca and Biliton.

The Japanese islands hold a position on the eastern shore of the great Euro-Asiatic continent very like that of the British Isles on the western; but their separation dates probably much further back, probably to the early portion of the Pliocene period. The fauna and flora of Japan and Formosa correspond in their diversity with the comparative antiquity hereby indicated. The richness which won for the latter island from its Portuguese discoverers the name of "the beautiful" gives abundant scope for the study of naturalists, of whom Mr. Swinhoe has made himself the chief. Above most continental islands it is shown by Mr. Wallace to throw light upon the obscure subject of the decay and extinction of species, whilst yielding an overwhelming mass of evidence in favour of the theory of descent with modification. In Madagascar we see a continental island of much more ancient date, and showing animal and vegetable types far more dissimilar from those of the mainland. Of mammals the most important are the lemurs, forming an entire half of the mammalian population of the island. This group of lowly-organized and very ancient creatures ranges from Western Africa to India, Ceylon, and the Malay Archipelago. Mr. Wallace, however, is justified by his latest researches in his rejection of the popular hypothesis of a submerged Lemuria, in which are held to lie buried the bones that should have made good the missing link between ourselves and our supposed anthropoid ancestors. The Atlantis having received its deathblow from the chapter on oceanic islands in the *Origin of Species*, it may be thought that the lost continent of the Southern hemisphere may henceforth be relegated to the region of scientific fable.

In the great island of Australia the primitive forms of animal

life correspond strikingly with the immense antiquity of its separation from the continental masses of the southern half of the globe. Nor in the case of New Zealand is there a less strongly marked correspondence between the zoological character of its fauna and the physical features of that isolated group. Mr. Wallace's survey of the widely separated island systems of the globe sets upon a solid basis his views of the wonderful powers of dispersion and modification existing in the organic world. In his theory of local geographical changes modifying the general stability of continents, we have perhaps a key to the most difficult and complex problems involved in the phenomena of the variation and distribution of living forms.

PICTURES FROM IRELAND.*

ARISTOTLE'S celebrated definition of laughter could hardly be better illustrated than by this book. There must be no pain, said the old philosopher, if we are to laugh at what is ridiculous, ugly, or out of place. These times are almost too serious for such a humorous sketch of Irish life as the one before us. Irishmen and Irish manners have ceased for the present to afford material for novels on the model of the late Charles Lever. Murder, sedition, anarchy, and outrages on unoffending men and cattle may be read of with a passing shudder in some history of a district in the Indian Mutiny, of an Italian city divided against itself in the Middle Ages, or in some Assyrian tablet just deciphered by the indomitable perseverance of Oriental scholars. They are sufficiently remote, and, as the typical old woman remarked, they happened so long ago that perhaps they may not be true. But the Ireland of to-day is too near us and too tragical to be any laughing matter. And yet this volume is written in an excellent spirit, without rhetorical exaggeration, and evidently from an intimate knowledge of Irish social life. The author says nothing about himself, and gives no reasons for his publication. There is neither dedication, nor preface, nor explanation of any kind which could give us a clue to the author's identity or occupation. For aught we know, Terence M'Grath may be a *nom de plume*, adopted from obvious motives of prudence. It is not every one in these days who would wish to have land in Ireland, as Mr. Bright would lead the electors of Birmingham to think was the main desire of his heart. And it is quite possible that the favourite remedy of a bullet may be reserved for those who, living in Galway, speak the truth about that county, equally with those who have the audacity to ask for their rents.

This volume is made up of eighteen sketches nearly all descriptive of persons in some way or other connected with the land. In a good many we observe a strong family likeness, such as one sharp practitioner bears to another. The unscrupulous attorney of the Glossin type; the howling agitator; the so-styled tenant's friend; the pugnacious and dictatorial priest; the defaulting cottier, are all united together by links in a chain of scarcely concealed craftiness, and all exhibit the same artless wish to live as much as possible at the expense of their neighbours. There are no scenes of horror, and no laboured attempt to create a sensation or to arouse false sentiment. Our nerves are not tried by some heartrending picture of an eviction, followed by the death of the unrighteous landlord at the hand of an assassin crouching under a dyke. One little girl, it is just hinted, dies of a fever produced by dirt and squalor; and there is a grim allusion to the death of a herdsman whom the brave boys only intended to beat because he succeeded a dismissed "brother," but who died unluckily from sheer accident, as he happened "to have a weak skull, and it broke sooner than could have been reasonably expected." But the prevalent tone of the writing is a humorous exposure of impudence, evasiveness, and falsehood, and, as we observed at first, at any other time but the present, one might read the tale with no deeper feeling than is aroused by the account of the ducking of a gauger and a duel in *Charles O'Malley*, or of the pursuit and capture of a poacher in Maxwell's *Wild Sports of the West*. These two hundred pages may be easily got through in a morning, and we are not called on to analyse each story, or do more than give a few outlines of what are clever pen-and-ink sketches, and not full-length portraits in oil. But they have all the appearance of reality. Mr. Kirkland, for instance, is a landlord of the old school. He has enjoyed his property, as his ancestors had done for 300 years. His rents, fixed at about 35 per cent. below the letting value of the land, have hitherto been punctually paid. But his fences are not better repaired, nor are his tenants' houses neater or more comfortable than those on the property of a neighbouring speculator who has increased his rental by 15 per cent. The explanation is that the latter enlisted the parish priest on his side by building him a new house. The priest, in another chapter, is one educated at Maynooth, an institution which has only served to confirm the prejudices of his boyhood and to turn him out with a profound ignorance of the world and of politics, as well as with an implied belief in the infallibility of the Church. He hunts and courses without much regard to boundaries, knows to a fraction the earnings of every one of his parishioners, and lectures and harangues them from the altar at the Easter and Christmas collections in a style not very different from that of the negro preacher in Marryatt's *Peter Simple*. In contrast to this Father is the Orangeman, born fifty miles north of the Boyne, who is prepared to vote for tenant-right, fixity of tenure, freedom of sale, and the ballot; but is dead against Popery, and averse to the lowering of the franchise and denominational education. One of the best hits is perhaps that of Mr. O'Hara, of Garrauns Castle. His ineffectual attempts to marry the daughter of a Manchester merchant, a far-off cousin it would seem of Thackeray's Miss Higg; his estate, nominally one of 600*l*. a year, but cut down by a jointure, interest on a loan, agent's fees, and other outgoings, to something less than 200*l*.; his gentlemanly indolence and remissness in his dealings with the tenants, which they requite by demanding a reduction coupled with a threat of no payment at all, are happily described. On the other hand, Mr. Casey began as an attorney, slid into the business of a land-agent, and hopes to end by buying a property which is the despair of a ruined absentee proprietor. Not very dissimilar in character and sharpness is Mr. O'Dowd, the successful shopkeeper. He combines the business of a draper and the sale of spirits with the purchase of small properties when they happen to come into the market. His opinion of his poorer countrymen is that they will cultivate just up to their necessities and no further. His position as a dealer enables him to supply worthless seed to his tenantry, and to compel their wives to purchase expensive finery over the counter at his shop in the town. And he very prudently declines to become a Poor-law Guardian, as in that office he would lose the chance of getting the contracts for supplying the workhouse. But in the famine he actually condescended to become a member of the Relief Committee, and was loud in proclaiming and supplying the necessities of his own tenants. As regards the agitator Mr. O'Dooly and the Home Ruler Mr. O'Carroll, it is only necessary to say that in specimens of truculent language, unscrupulous devices, and mendacious impudence, they are left far behind by the real agitators, who have succeeded, to the understandings of most people, in making government by the ordinary processes a sheer impossibility.

Lord Beaconsfield once said in the House of Commons that Irish members were too much in the habit of clanking their chains on rising to speak. The wrongs of Ireland, the woes of the lovely Emerald Isle, the injustice to the brave sons of Erin, have furnished ample material for frothy declamation to orators and journalists; and even sober-minded statesmen seem to have got into a trick of declaiming about the heavy debt under which England lies to that most innocent and most injured country. How is it, we may ask, that we never hear this sort of language applied to Scotland? For every high-handed act committed in Ireland by Strongbow, or Cromwell, or Pitt, in the period of their ascendency, it would not be very difficult to find a parallel in Scottish history. The annals of that country are for centuries taken up with invasions and battles, in which Scotchmen, fighting for their nationality, poorly armed and scarcely disciplined, almost invariably got the worst. The persecutions of Whigs by Claverhouse and his men, the scant justice done to Scotch interests at the Union of 1707, the vengeance exacted on Scotch rebels in the Fifteen and the Forty-Five, and divers other episodes, might surely form a fertile subject for impassioned oratory if influential and clever Scotchmen were not generally men of strong sense. But no one, except an inebriated Scotch apprentice or a clerk at a St. Andrew's dinner, ever thinks of dwelling on the injustice practised generations back by Tory Ministers or High Church prelates. Even Professor Blackie only gives an occasional vent to his national feelings, and though the member for the Kirkaldy Burghs may please his constituents by lamenting that sufficient priority is not allotted to Scotch affairs, we know no grievance to which Scotchmen are in the habit of calling attention or which ought to afford matter for complaint, unless it be that their Lord Advocate is unable to find a seat in the House. Of course, it may be replied to this unfavourable comparison that the Irish are a more excitable and difficult people to deal with; that the real offence of the Protestant Church has only recently been taken away; and that the tenure of land is of that exceptional, peculiar, and complicated character which demands special study and unusual remedies. But we should like to know how long any Government would put up with one quarter of this agitation if shown by Lowland farmers who had objected to the old law of hypothec, or elders of the Established Scotch Church who had new views about the exercise of ecclesiastical patronage. The real fact is that Ireland has of late years been treated not like the naughty boy, but like the spoiled child of the family, though to assert and act on this maxim may require no little audacity. A writer in the *Times* who, we understand, has had some practical experience of Zemindars and Ryots in India, lately endeavoured to make out that there was a strong analogy between the condition of the Irish tenant and the *jotedar* of Bengal. The remedial legislation contemplated by the Government should, he argued, follow the course taken by those who passed what, under various titles, are known as the Rent Laws of Bengal. This gentleman forgot one essential difference in the position and rights of the two communities. The Indian Government has of late years endeavoured to secure to the Ryot that definite position which had been contemplated for him in the Regulations of 1793, which was based on the immemorial custom and the common law of the country, and which neglect of rulers or oppression of Zemindars had failed to obliterate. The Land League are in reality clamorous for an independence utterly incompatible with the acknowledged position of a superior owner, with the law of contract, and with the history of Irish occu-

* *Pictures from Ireland.* By Terence M'Grath. London: C. Kegan Paul & Co. 1880.

pancy, agriculture, and proprietorship. To quote an Indian precedent as applicable to Ireland without bearing in mind the marked distinction between a Zemindar in Nuddea and Lord Erne or Lord Lansdowne, and without a clear idea of the meaning of a Revenue Settlement and its ample definitions of every one's rights and privileges in the soil, is to trade on the ignorance of Englishmen and to argue on misleading analogies.

The last chapters in Mr. M'Grath's book are devoted to the Irish famine, or rather are written to prove that for purely selfish purposes a famine was evolved out of scarcity and not very severe pressure. According to the author, the effect of the Duchess of Marlborough's kind appeal was mainly to create a competition in mendicancy. While money was pouring in, "the markets were thronged with well-dressed people; the shops were filled with customers; the pawn offices showed empty shelves"; and tradesmen, mechanics, and farmers, with stores in their cupboards, were not ashamed to beg for meal at the rooms of each committee. It was, however, not to be expected that Englishmen and colonists in Australia and elsewhere would not respond to a call on behalf of a poor community alleged to be in danger of starvation for, at that time, no fault of their own. Our regret is, not that charity should have been misapplied, or habits of self-dependence been impaired, or tons of potatoes imported into a district which was sending off cartloads of the same produce. The sad moral of the famine is the absence of gratitude and the revival of lawlessness and ferocity in the mass of the people. In truth, either the real character of the Irish has only been known to a few experts, or else the amiable and humorous features which lent attractiveness to former stories have worn off and have disclosed something like Asiatic turpitude. The good understanding which once existed between easy-going landlords and sharp-witted peasants, and even mitigated religious antipathy between Papist and Protestant, seems gone for ever. In the *Wild Sports of the West* there is a good story of a Protestant clergyman who preached to empty benches, and was reported to his Bishop as a vicar without a congregation. Hearing that his superior was coming down to visit the empty church, he applied in his dilemma to his Roman Catholic brother to "lend him a congregation." This strange loan was actually granted, and when the Bishop arrived he saw a church crowded with a well-dressed and orderly set of Roman Catholics sent there at the bidding of their pastor to do duty as Protestants and throw dust in the episcopal eyes. This really occurred some three generations ago in the West of Ireland. We need hardly add that it would be impossible now. Nor shall we be surprised to find that, as one violent deed begets another, the national reputation for pleasantry will die away, and that in the next *Pictures from Ireland* worse tales of barbarism and savagery will make us wonder how Irishmen could ever have been noted for happy repartees, excusable frolics, and genial fun.

THE CHALLENGE OF BARLETTA.*

We owe some gratitude to Lady Louisa Magenis for having led us to read *Ettore Fieramosca* again. For the benefit of those unacquainted with that romance, we had better explain at once that Massimo d'Azeglio's work bears a double title, *Ettore Fieramosca, o La Disfida di Barletta*, and that Lady Louisa Magenis has, we think unwisely, chosen to drop the first and familiar name in favour of the second and more descriptive title. Having begun by expressing our gratitude to the translator, we will next say, to prevent disappointment, that we do not recommend *Ettore Fieramosca* to any but the young, or those who have preserved a healthy youthful taste for romance of the school of the Waverley Novels. We remember when the wickedness of the Borgia, as therein depicted, made our hair stand on end, and when the wrongs of Ginevra troubled our dreams. We remember with what interest we followed all the bull-fighting and lance-breaking business, of which, to say the truth, there is rather more than enough. If the characters were, as we now more than suspect, conventional, we did not then find it out. And that there is real power in the story we cannot doubt, since we knew a learned and staid professor and his wife, neither of them by any means in their first youth, who made a pilgrimage to Barletta, expressly to see the spot consecrated by the valour, the patriotism, and the ill-starred love of Ettore Fieramosca. By their account Barletta then—it was some years ago, so we make no imputations against the present character of the town—had not, in the matter of creature comforts, much advanced since the days when the Borgia and his *âme damnée* got so bad and so dear a supper at the hostelry of the Sun; but nevertheless our couple did not repent of their visit. This, we think, proves incontestably that there is genius in D'Azeglio's novel, though it does not equal his later Florentine romance, *Niccolò de' Lapi*, which has, we believe, the further merit, recognizable by Italian critics, of being written in a purer Tuscan style.

The historical incident upon which the plot of *Fieramosca* turns is of the slightest, though it is true that to an Italian the "Challenge of Barletta" has an importance which it can hardly possess in the eyes of a foreigner. In 1503 the Spanish under Gonzalo de Cordova, with their Italian auxiliaries under Prospero and Fabrizio Colonna, were blockaded in Barletta by the French under the Duke of Nemours. As D'Azeglio tells the story, some French gentlemen taken prisoners by a foraging party from Barletta were supping amicably with their Spanish captors, when one of the Frenchmen, De la Mothe—"suopte ingenio ferox et forsan frequentibus poculis incalescens," says Paolo Giovio—let fall expressions of contempt for the Italian men-at-arms, at last averring that a French gendarme (we must remember that the gendarme of those days was not a mounted policeman in a cocked hat and a swallow-tailed coat, but a fully-armed cavalier) would think shame to have even for horseboys such poltroons as the Italians. The words were taken up; low as Italy was sinking, subordinate as was the part which the Italians played in their own land, their national pride awoke at these insults. A combat between thirteen Italians and thirteen Frenchmen was arranged; the event, in sporting parlance, came off near Barletta, between Andria and Quarato, on the 16th of February, 1503, and proved a victory for the despised Italians. So sure, it is said, had the Frenchmen made of success that they had omitted to deposit with the umpires the sum stipulated for ransom in case of defeat. This affair, unimportant as it may seem according to modern ideas, was glorified as a great national triumph. The victors were hailed as *restitutori della gloria Italiana*, and their captain, whose name of Hector lent itself well to classic strains, was poetically eulogized by Pietro Summonte as *Ausoniæ splendor*: an eyewitness, Damiani, narrated the particulars in a book published at Naples the same year; Vida sang the combat in Latin hexameters; and Paolo Giovio and Guicciardini—though the latter so far mistook the cause of quarrel as to represent the French as the insulted party—recorded the prowess and the names of the patriots, whom Guicciardini introduces as "degni che ogni Italiano procuri quanto è in se, che i nomi loro trapassino alla posterità." One Italian, a Piedmontese, figured among the French combatants—a curious inconsistency, if the issue of the combat was to prove anything as to the merits of the Italians generally. That man alone, according to the account followed by D'Azeglio, was left dead on the field, justly punished for his treason to his country.

Round the names of Ettore Fieramosca, the captain of the Italian thirteen, and Claudio Grajano of Asti, the Piedmontese renegade, Massimo d'Azeglio—himself a Piedmontese, and therefore, as he said, the better able, without offence to provincial feelings, to brand the memory of the traitor—wove his tale. So slight an incident as the Challenge of Barletta demanded some tragic interest to give it dignity, and accordingly D'Azeglio's imagination founded upon it a romance tragic enough in all conscience. Ettore Fieramosca, young, pale, and chestnut-haired—memory recalls a hundred heads by Italian masters, of which any one might serve as a portrait of D'Azeglio's hero—appears from the first as a man consumed by an unhappy love. The object of his adoration, Ginevra di Monreale, had in his absence been constrained by untoward circumstances to give her hand to the adventurer and future traitor, Claudio Grajano, who valued her only for her dowry. When married, she had been pursued by the hateful love of *il Valentino*, better known to English readers as Cæsar Borgia, and had died, it was supposed, of poison administered by him in revenge for her coldness. But we all know that Italian heroines have a way of coming to life again. Like the lover in the *Golden Supper*, Fieramosca stole at night to look once more upon his beloved as she lay coffined in the church of St. Cecilia, and, arriving in time to forestall Cesare Borgia, whose poison was only a sleeping-draught, he found her living. As her husband had disappeared on the Borgia's service, the resuscitated heroine was persuaded by Fieramosca to trust herself to his honour; and thus, some two or three years later, we find her lodged in the nunnery on the island between Monte Gargano and Barletta, and receiving visits from Ettore under the title of her brother. With her she has, as chaperon and companion, a mysterious Saracen maiden, who has likewise been thrown by fate on the gallant Fieramosca's hands. It is somewhat trying to the imagination to conceive a young soldier of the *cinquecento* thus leading about two ladies who stand to him in the relationship of sisters; but such is the story. At last comes the unlucky day when Ettore, being despatched with the all-important challenge to the French camp, finds himself face to face with Ginevra's husband. The temptation to keep silence is too strong for him; he leaves Ginevra in her ignorance, and though he is bound by a vow not to lift his hand against her husband, one can hardly suppose that he does not build some hopes upon the chances of the approaching combat. But the reader, who knows that Cesare Borgia and his satellite Don Michele are prowling in disguise about Barletta, feels that the doom of the lovers is inevitable. A stroke of a poisoned poniard lays Ettore temporarily prostrate; while chance, rather than contrivance, throws Ginevra into the hands of the Borgia. It must be owned that D'Azeglio was merciless in accumulating horrors on the head of his unhappy heroine, who has nothing left but to die—in peace, it is true, tended by Vittoria Colonna, and with the consolations of religion, but believing by a cruel error that Ettore has deserted her for the fresher charms of Gonzalo's daughter, Doña Elvira. Ettore himself, miraculously healed by the Saracen maid on the very eve of the combat, is deceived in another way, and that by his especial friend and confidant, Brancaleone. In order that he may go to battle with a good heart, he is assured that Ginevra is alive and well. For once all seems to prosper; the honour of his country is triumphantly vindicated in the lists; the insulter, La Mothe, surrenders to him; Grajano lies dead on the field, his skull cloven by Brancaleone's axe. Fieramosca has

* *The Challenge of Barletta.* By Massimo d'Azeglio. Rendered into English by Lady Louisa Magenis. 2 vols. London: Allen & Co. 1880.

now done his work for Italy, and the friends who had taken such cruel care to spare his feelings forget to look after him any longer. He is left to ride off to his Ginevra, and to find her a corpse. Maddened by the shock, he spurs his wearied charger into a gallop, and is seen no more. Only some charcoal-burners of Gargano tell of a strange vision of an armed and mounted knight on the summit of cliffs supposed to be inaccessible; and a century later, the sea having receded, a mass of rusted iron and the bones of a man and horse are found below.

The present version is, on the whole, more easy and spirited than the general run of translations, but it is in many places sadly open to criticism. We do not approve of the silent omission of D'Azeglio's concluding remarks, which, though unnecessary to the story, are interesting as showing the patriotic purpose with which it was written. We have also a suspicion that the titles and mottoes to the chapters are unauthorized additions—at least they do not appear in the edition of *Ettore Fieramosca* published at Paris in 1833; and the fact that the mottoes are all quotations from English authors looks as if they were of English choosing. In the translation itself the chief faults that strike us are, first, a tendency to drag in French expressions, such as *fracas*, *tête-à-tête*, *confrères*, which do not appear in the original, and which therefore give a false notion of D'Azeglio's style. Thus in a single sentence Fieramosca is made to say *à propos* and *hors de combat*, though the original Italian could easily have been rendered into good English. *Bataille à l'outrance* (for *battaglia a tutte armi ed a tutto sangue*) is a well-known stock phrase of English historical novelists—we say English because French usage only acknowledges *à outrance*. Few English writers remember that the phrase had an English form, "to the utterance," or "at utterance," which is employed in the *Mort Darthur* and by Shakspeare. There is no excuse for giving the result of a duel thus, "He forced him to make the *amende honorable*," when the original is simply "Gli fece confessar il suo torto." These remarks do not of course apply to the cases in which D'Azeglio himself has put into the mouths of his characters scraps of French and Spanish. In one instance the translator has turned "con mezzo parole" into "with *sotto voces*," which is neither English nor Italian. Our second ground of offence is the introduction of modern slang, which sounds incongruous from the lips of sixteenth-century cavaliers. It would perhaps be pedantic to object to "pluck;" but "I certainly shall expect a tip in return from you" and "It will be a regular jollification," are too unromantic. When Jacques de Guignes says, in dignified and chivalrous phraseology, "Pure un uomo d' arme si crederebbe disonorato se ad armi e a numero pari la sua spada cadesse sul cavallo del nemico," why should his words be rendered into the slang of the Turf and the "Society" papers—"However, a good man-at-arms, if equally matched, would, even now, consider it *very low form* to let his sword fall on his enemy's horse"? Or why should Prospero Colonna, in a moment of grave anxiety and displeasure, be made to ask, "Pray where is Fieramosca that he has not shown up?" "Che non compare"—"that he does not appear"—are the plain words of the original. So when Grajano says, in the simplest possible words, "Son d'Asti," the translator must needs render it, "I hail from Asti." And when we find "ove accaddero i fatti" rendered as "where the events *transpired*," we can only remark that it would be well if the translator would give some attention to the study of her own language. We also note one or two positive errors. A *destriero morello* is a black, not, as here translated, a "mulberry-coloured steed." The origin of the epithet must be looked for in *maurus* in its primary sense of black, not in its secondary form *morum*, a mulberry. In an official proclamation offenders are threatened with the penalty of "two cuts with a rope"—a moderate degree of personal chastisement, to use the dignified language of the present Home Secretary. But in the original the penalty is something more serious—"due tratti di fune"—two hauls of the rope, *i.e.* two inflictions of a kind of torture identical with or resembling what we know by the Spanish term of the strappado. A few lines further on, the translator, constant to her first idea, renders "per timor della corda" as "from fear of the lash," though in so well-known a work as Baretti's Dictionary she could have found "Corda, the strappado." Fieramosca is made to describe himself as "one of Signor Prospero's free lances," which is equivalent to styling himself a mercenary; whereas in the original he calls himself simply a *lancia* or lance, the ordinary term for the man-at-arms. *Free lance* is again made to do duty as a translation of *lancia spezzata*, a technical military term, which in France and England took the form of *lancespessade*.

WATSON'S WAZAN.*

MR. WATSON went to Morocco in general, because, though it is only six days' voyage from us, hardly anybody ever goes there, and he visited Wazan in particular, because no Englishmen and only one European had ever ventured within its sacred precincts. Mr. Watson had no previous knowledge of the country, was ignorant of all the languages and dialects spoken there, derived all his oral information from a dragoman, his ocular impressions from a hurried trip of three weeks in the country, his historical, geographical, and archæological learning from subsequent study. Out of this unpromising apparatus he has constructed a readable, if not an authoritative, book. His very decided statements must not be accepted as undeniable facts, for a European eye unaccustomed to Mohammedan manners is apt to be deceived, and a clear proof received through a dragoman's interpretation may turn out to be no evidence at all when traced to its original source. Beyond a certain quickness of observation Mr. Watson had none of the qualities which are required in one who will draw a true picture of a country, such a picture as Klunzinger has drawn of Egypt, and Malcolm of Persia as it was. He cannot even boast an alluring style, for his language has but the one merit of simplicity, and is neither choice of phrase nor graphic in description. The same ideas and words are constantly recurring, and we gave up the attempt to count the number of times the word "greenery" was used. Nevertheless, though loosely made up, founded on scanty knowledge, and expressed without that "curious care" which Mr. Stopford Brooke includes among the essentials of prose writing, the book has its value.

This value does not lie in the fact that Morocco is a little-known country. All Mr. Watson's very just eulogies of the golden days of Moorish art and science do not make the descendants of the banished Moors who took refuge in Morocco one whit more interesting. The very greatness of the mediæval Moors is an argument for the littleness of the modern Moors, because most nations have their times of prosperity and progress, and of relapse and decay. It is not necessary to criticize what Mr. Watson says about the past history of Morocco, because it is obviously book-making, and the errors he repeats are very probably not his own. All that he need have concerned himself with was the present state of the country and the description of its aspect as a resort for seekers of the picturesque. When he does arrive at this point, the reason why Morocco is little visited becomes apparent. "The land," he says, "though rich, is not productive; the great desert plains are more strange than beautiful; the country in summer and autumn has a dead played-out effect; the towns present hardly any features of architectural interest. There is a certain suggestion of decay over the whole land; the gilding is rubbed. The only motto truly appropriate to the Moorish crown is *laissez faire*." Throughout the book the deadness and dulness of the country strike cold upon the reader, and whenever there is any "greenery" to be enthusiastic about, the same terms of ecstasy are employed about precisely the same things. But "the chief attraction of Morocco for the traveller lies in its people and its government; a people of surpassing picturesqueness and interest—a government which possesses none of the ordinary attributes of direction, but exists for the one purpose of taxing the people." Neither of these attractions will strike the student of Mohammedan nations as peculiar, and it would perhaps be more pleasant to combine them with the attraction of scenery, as may be done in other Moslem lands. Mr. Watson's delight in the ways of the people is natural enough, however. There is nothing more delightful to a busy man than to forget his anxieties and bustle in the calm torpidity of Oriental society. Apart from the charms of novelty and varied colour and a sunny climate, there is something about the East (and Morocco is socially as truly "Eastern" as Persia) that brings to the excited Northerner a wonderful sense of rest and subdued enjoyment. Still, however new and charming all this may be, it is too well written about to need a fresh description unless by a very able pen. Mr. Watson's views about Morocco and the Moors are not authoritative or particularly suggestive. His account of the Jews of Tangier is a contribution to the literature of a subject to which the efforts of Sir Moses Montefiore and the decisions of the Madrid Conference have given some importance; and his general appreciation of the Moors, though based on a short acquaintance, is a set-off against the unfavourable reports of some other travellers who knew little more of this hospitable kindly race than he does.

The value of Mr. Watson's book, however, lies in the seventy or eighty pages in the middle of it which treat of the subject which gives it a title. His journey to and from Wazan, although possessing something of the interest which a description of unfamiliar scenes generally affords, was uneventful, and, from an artistic or any other point of view, apparently unproductive. The arrangements with the dragoman, the management of stirrup-leathers, the encounters with various hostile insects, and the other commonplaces of travel, would read excellently well in a guide-book, and will doubtless be useful to those who may follow in Mr. Watson's steps; but they cannot be said to excite much surprise or interest. The only remarkable fact is, that there were no more serious enemies than vermin, which is certainly not what might have been expected in an unsettled country like Morocco; but Mr. Watson's unusually powerful introduction doubtless protected him where others might have been attacked. The general conclusion to be drawn from the journey is that Mr. Watson understands the art of being comfortable, and that he does not "rough it" when there is no occasion. The account of Wazan itself, however, is curious, and speaks to a singular political condition in the country.

The northern provinces of Africa have always been famous for heterodoxy. The native races, whom the Arabs, following the example of the Greeks and Romans, called Berbers or barbarians, because they could not understand their tongues, proved the hardest of conversion of all the peoples over whom the armies of Islam rolled in their great tide of conquest; and when Mohammedanism at last obtained a foothold among them

* *A Visit to Wazan, the Sacred City of Morocco.* By Robert Spence Watson. London: Macmillan & Co. 1880.

it forthwith developed a heresy. Thus the heterodox Fatimite sect was fostered in Barbary, till it grew into an empire, and subdued Egypt and Syria. So did Morocco bring forth the Almohade sect, and many other heresies found their cradle or their refuge among the credulous Berbers. One prophet or saint after another has led this superstitious people to conquest or destruction, and they have always been ready to believe in the next comer. In the present day the old feeling is as strong as ever, and the Moors have precisely the same abject reverence for their saints as they had in the days of the many Mahdis who from time to time imposed upon them. Every saintly family in Moslem countries naturally traces its descent from the prophet Mohammed, and as such assumes the title of Shereef or Cherif. We know these descendants of "the Seal of the Creation" all over the East by their green turbans, and marvel at the reproductive powers of one family. We have also heard of the Shereef of Morocco; indeed there have been two dynasties of these Shereefs, who have governed the country for the last three centuries and a half. But the present representative of this line, better known as Emperor or Sultan of Morocco than as Shereef, has lost most of his sacred attributes, and is become merely the tax-collector of his people. The real Shereef does not live at the capital nor holds any nominal power, but contents himself with the actual sovereignty involved in the absolute submission and enthusiastic devotion of the whole nation, and the homage of even far-distant lands:—

No duties, either political or religious, are involved in the dignity; it does not carry with it any distinguishing name or title [?]; and it does not immediately confer any authority. But the power which the great Cherif wields is substantial enough; the Emperor receives him, alone among men, as his equal, and appeals to him for assistance in times of difficulty; in cases of serious rebellion he has accomplished what an army of soldiers could not, the mere fact of his presence sufficing to put the insurgents to rout; and upon more than one occasion he has undertaken long and difficult journeys even to the Sahara itself to obtain the submission of some border chieftain who has been occasioning trouble to the reigning house. He is the object of pilgrimage from all parts of Northern Africa; Mohammedans have even travelled from India to obtain his blessing; and when the present bearer of the name made the journey to Mecca, he was even there the object of marked respect and veneration, the worshippers actually leaving the Kaaba to prostrate themselves before him."—Pp. 21–2.

The present great Shereef has done what his ancestor the Prophet would certainly have disowned him for doing—he has married an English lady. Mr. Watson is full of hope as to the influence of a refined Englishwoman on the future of Morocco, and no one can doubt at least the temporary importance of the Shereef's alliance. To Mr. Watson himself it had a peculiar value; for, after a charming visit to the great man and his English wife at their beautiful villa on the hills near Tangier, he received from the Shereef a letter of introduction, in which (as was discovered when the journey was over) the holy man, regardless of truth, had condescended to state that Mr. Watson was his wife's brother. The reputation of being brother-in-law to the Great Shereef would account for Mr. Watson's hospitable welcome among all classes, without presupposing any unusual kindness on the part of his entertainers. The Shereef, it must be observed, was not himself living at Wazan, but allowed his second son to act as his deputy; whilst he himself enjoyed his villas near Tangiers, and wore trousers, and sat upon chairs, and behaved generally as no respectable Moslem used to do in the golden prime of good Harun Alrashid.

Wazan itself is a modern creation. It does not rank among the famous cities of mediæval Morocco, but was established, or enlarged from villagedom, by the founder of the modern house of Shereefs, Abdallah, who died in 1675. He came of the old stock of the Edrisites, who were the leading family of Morocco in the earlier centuries after the Hegira. Mr. Watson was received at Wazan with great cordiality by the son of the Shereef, who acted for his absent father. The very first experiences were charming:—

A manly young fellow, with a kindly, open countenance, richly but simply dressed, apparently of about twenty-five years of age, came forward and shook hands with me warmly, and gave me a right hearty welcome. He led me at once to my room, filled with vases of sweet-smelling flowers; showed me the bath-room and other offices, which were admirably appointed; and, whilst my things were being carried in, called a slave, who brought us excellent coffee in exquisite china. My men were presented to him one by one, each kneeling and kissing his knees with much devotion. He then asked me at what hour I liked to dine, and left me to rest. But rest was out of the question. . . . My room was so charming and so curious —another of those long, narrow, windowless rooms, forty feet by fourteen, and very high, carpeted with layers of thick Moorish rugs, each of which was a marvel of art, and none of which belonged to the melancholy aniline-dye period; a low divan ran all round it, a divan of luxurious cushions, covered with delicate shawls; at one end was a low Moorish table of wonderful beauty, loaded with all manner of fragrant waters in silver flasks, pomades, and other toilet appliances; near it stood a great musical-box, and a kind of harmonium and organ combined—an instrument which could be played upon or which could be worked by a handle; at the other end, in a lovely Moorish recess, was the bed, with marvellous coverlids and pillows, almost too fairy-like for actual use; close to this stood a pedestal with admirable washing appliances, and a constantly-renewed supply of orange-flower water. On the floor lay a kind of mattrass for the noonday siesta. In the centre of the room there was a fine Moorish cushion, with an exquisite brass tray upon it, and a silver candlestick, with candle and matches, and a pretty bell. Above the divan the sides of the room were tiled for a couple of feet, and against the walls hung some of the most interesting specimens of firearms, swords, daggers, &c., which I have ever seen. The wooden roof or ceiling was specially beautiful—the groundwork a rich chocolate-brown, two beams sober olive-green, then one dull red, then the fourth light green, the fifth dull red, and so on. The doorway of the room was a fine horseshoe arch, richly tiled, over which three layers of curtains fell, or from which they were looped back, as you chose. The door itself was a good specimen of the best Moorish woodwork. You passed down one broad easy step into an alcove, twelve feet square, and carpeted with thick rugs. In it stood two chairs and a little table, which always held clear fresh water, olives, nuts, grapes, biscuits, scent, a gem of a bell, and a large bowl of lovely flowers. From this alcove four steps led down to a narrow terrace, which extends from the gate to the bath-room.—P. 179.

Beyond was the garden, richly laid out with flower-beds, and watered by a natural stream; and, further off, the view ranged over "a wide rich valley, with fine hills on either side, to the distant mountains, range rising over range, and with fine outlines, and an ever-changing play of colour which was simply fascinating."

Whatever we may think of bells and matches in a Moslem house, there can be no doubt that the reputed brother-in-law of the great Shereef had fallen on his feet. He passed three days of bliss in this paradise. He dressed for dinner in English black cloth to please his host, and pleased himself by admiring the picturesque attire of the young Shereef and his elder brother, and not least his secretary, who was something of a dandy. Great conversations were carried on between the Moors and their guest, and the young Shereef and his brother proved themselves to be men of intelligence and perception. The Shereef sang songs and played the organ, and then when "one or two saints dropped in" (as Mr. Watson puts it) the great operation of the day began. Slaves approached bearing a teapot and accessories. "The secretary first put in a quantity of green tea, and then filled the pot with loaf-sugar, afterwards letting the boiling water soak through it and fill up the interstices. When the sugar had melted he put a handful of sweet-scented geranium into the pot, and poured the tea into small Venetian-glass tumblers. The custom is to drink it with considerable noise, and to take three tumblers at each brewing." Mr. Watson went on a picnic one of these days, and lived to record that he got through fifteen tumblers of green tea in one wood, without counting coffee; another day he managed three cups of coffee and twelve tumblers of tea; and meanwhile was urged by his hospitable friends to eat beyond his ordinary capabilities of peculiarly rich food "cooked in argan oil," and such dishes as "a kind of ginger-bread floating in eggs, oil, and butter, and a delicious cake of forty-eight diamond-shaped macaroons, each with some kind of jelly inside." It is not recorded whether all the forty-eight disappeared, but enough is told to make it no matter for surprise that Mr. Watson was taken seriously ill on his return journey. The wonder is that he returned at all. During his stay with the Shereef he preserved his health marvellously, and contributed to the amusement of the party by such European novelties as magnesium wire, coloured fires, and the like. One of his presents was a stroke of genius, and had its reward:—

I had with me a number of children's india-rubber squeakers, and I armed each child, the secretary, Sûuci, all of the servants, and myself, with these, and we soon brought papa [the young Shereef] and all his suite to see whatever was going on, and thoroughly did they all enter into and enjoy the fun. Those squeakers proved quite irresistible. In the night I heard a loud squeal, and slipping out discovered behind a corner a solemn Moor half frightened and half ashamed. He had retired to enjoy his squeak all to himself in private, but had quite forgotten that it would not be a quiet squeak, and was trying in vain to stop it.—P. 240.

Mr. Watson's three days' stay at Wazan is an experience worth relating, and he has given a very good picture of the place and its courteous chief. It is not stated what the young Shereef remarked when he found out, after Mr. Watson's return to Tangier, that he was not the brother-in-law of the great Shereef after all. But probably Mr. Watson would have received much the same courtesy and hospitality without the deception, for which he was not responsible; and one reason for it would have been the fact that he treated the people of all classes as Christians and fellow-countrymen, not as dogs of Turks. One thing, at least, which his unpretending little story might teach, if it has not much else to impart, is the sorely needed lesson of commonly considerate behaviour on the part of travellers *in partibus infidelium*.

THE POET AND THE MUSE.*

IT is not necessarily untrue because it is trite, that the value of a book is not always to be ascertained by the use of a pair of scales. Mr. Pollock's little book presents itself in the form of a pamphlet only. Perhaps with a little attention to what Mr. Carlyle would call the Coarse Arts of book-making, it need not have done so. Most experienced reviewers of minor poetry can remember dozens of volumes of "Musings" and "Evening Rambles," and so forth, which, by dint of stout cloth boards, thick paper, bold type, and plentiful half-titles, have assumed a tolerably portly appearance without containing more matter than the pamphlet before us. In any case, however, *The Poet and the Muse* could hardly rest its case on bulk. But it is, in the first place, a remarkably adventurous and a remarkably successful attempt to give letters of English naturalization to a poet who has, especially of late years, had scant justice done to him in England. And, in the second place, it seems well suited for the purpose of filling a gap which exists at present among us, and which seems to demand that it should be filled. As a version of Alfred de Musset it is very good; as a specimen of English dramatic versification adapted

* *The Poet and the Muse.* Being a Version of Alfred de Musset's "La Nuit de Mai," "La Nuit d'Août," and "La Nuit d'Octobre. With an Introduction. By Walter Herries Pollock. London: Richard Bentley & Son. 1880.

to the purpose of exercising aspirants to the poetical drama, it is perhaps better still. No one who is at all interested either in matters dramatic or in matters literary is ignorant that there have been lately great searchings of heart for this said poetical drama. We have a few—a very few—writers who can write it; we have a certain number of spectators who would go to see and hear it; but have we actors to act it? The question is rather a ticklish one, and, instead of attempting to answer it directly, perhaps we had better say that, if we are to have actors who are to speak blank verse properly, there must be blank verse by which they can be educated to speak it. Entire plays are practically useless for such a purpose; excerpted scenes are not much better, and have the drawback of being excerpts, and therefore in a manner mutilated; single *tirades* encourage monotonous declamation instead of acting. These versions, the originals of which it need hardly be said often receive stage interpretation in France, seem to be excellently fitted for the purpose, and we scarcely know anything else lately written that is so fitted.

The peculiar dramatic "virtue" of Alfred de Musset is indeed one of the most remarkable things in recent French literature. Not merely did he actually produce dramas which, small as is their scale, are probably the best dramatic compositions of the time, but even his non-dramatic work is saturated with the dramatic spirit. His narrative poetry constantly turns and twists itself into dramatic forms, such, for instance, as the famous and magnificent *tirade* in *Rolla* beginning

> Et que nous reste-t-il à nous, les déicides?

The narrative itself is couched (as in the lines of this very *Nuit d'Octobre*, "C'était, il me souvient . . .") in the consecrated forms of recital employed on the French stage ever since Jodelle and Garnier borrowed them from Euripides and Seneca. Had the temperament and circumstances of the poet been somewhat different, he might have attempted the poetical drama on a great scale, and could hardly have failed to produce masterpieces. For, if he falls short, as he certainly does, of Corneille and Hugo in the great and terrible, he has corresponding advantages. The sense of humour, for instance—necessary perhaps to the tragedian, more even than to the writer of comedies—must be acknowledged not to be the strong point of either of the great dramatists just mentioned; but Musset has it. His evident tendency, too, to break through the fatal stays and padding which had encased the French drama, joined to his extraordinary facility and fluency in half-pedestrian versification, might have had full scope given to it in the romantic drama. This was not to be; but at any rate we have the *Comédies*, and the *Proverbes*, and the *Nuits* to tell us what might have been.

We shall not apologize for keeping Mr. Pollock waiting during this preliminary disquisition, because the importance and interest of his "Specimens of Poetical Dialogue," as we feel rather inclined to call them, are intimately connected therewith. Mr. Pollock has taken the first, the third, and the fourth of the four *Nuits*, omitting the second, the *Nuit de Décembre*. This, as he says, justly enough, is cast "in a method entirely different from that of the other three." The fact is that the *Décembre*, though perhaps the most beautiful of the series, is not only not dramatic in form, but is purely poetical, and not in the least dramatic either in conception or execution. Its identity of title with the others can only be regarded as an accident. By way of striking the keynote of the three pieces intelligibly to those who know little of Musset, Mr. Pollock has prefixed a poetical introduction of a couple of pages, which gives a very good "character" of the poet in the seventeenth-century acceptation of the word, and may be said to have something of the features of the Euripidean introductory speech. This is in blank verse, and so are the versions themselves. Mr. Pollock apologizes for this on the ground that he "found he could, to his thinking, catch more of the spirit of the original" in blank verse than in an exact reproduction of the rhymes and of the actual metres of the French. There is little doubt that he is right—at least if the contention which we have advanced, that the *Nuits* are essentially, if not entirely, dramatic in execution as well as in spirit be sustainable. For that blank verse, and blank verse only, is the medium of dramatic writing in English is a question settled long since by the amplest and most patient combination of argument and experience. In French, from the orthoepic peculiarities of the language, blank verse is an impossibility, and more or less varied rhyme is the only alternative to the descent into actual prose. In translating the *Nuits* into blank verse, therefore, Mr. Pollock has sacrificed the accidental letter to the essential spirit. And his blank verse is very good blank verse, as the following specimen will show:—

THE POET.

> How dark the valley lies! Methought I saw
> A veiled form leave the meadow, and flit forth
> Among the trees, and with a lightsome step
> Disturb the grass. It was a fantasy
> That dream-like passed and vanished into air.

THE MUSE.

> Take thy lute, Poet. Night upon the lawn
> Rocks in its perfumed veil the zephyr's breath;
> The maiden rose shuts on the burnished drone
> Drunk with her sweets, and dies upon a kiss.
> Silence is lord. Think, Poet, of thy love.
> To-night beneath the lime-trees' darkling arms
> The dying sun's farewell is passing sweet;
> To-night immortal nature brings again
> Her dearest perfumes for the whispered love
> That waits upon the bridals of the spring.

This is not merely of the right dramatic stamp, but it avoids the fault which some writers who have mastered certain of Shakspeare's cadences often fall into—the fault of ringing too few changes. Here is another of a different kind:—

> How shouldst thou value life's delights, if thou
> Hadst never known the pain that is their price?
> How shouldst thou love the garden-scented breeze,
> The birds' rejoicing anthem, and the arts
> That lend a grace to Nature, if through all
> Thou didst not hear the echo of past sighs?
> The heaven's illimitable harmony,
> The silence of the night, the murmuring flood—
> How shouldst thou love all these, unless thy pain
> Had made thee long for an eternal rest?
> What, then, is thy lament? Immortal hope
> Should spring in thee from sorrow. Wherefore hate
> Thy young experience, or deplore an ill
> From which is born thy better, wiser self?
> My child, keep pity for that faithless one
> Whose beauty caused thy tears—for she it was
> Who showed thee Sorrow's road to happiness.
> She loved thee; but the Fates had chosen her
> To bring thee face to face with life's intent.

A glance at the original of either of these will show that Mr. Pollock has not aimed at anything like a literal rendering; that he has, in his own words, endeavoured to produce "a version rather than a translation." We are not sure that we should not call it a paraphrase rather than a version. In the speech of the *Nuit d'Octobre*, for instance, from which our last specimen is taken, there are in the original seventy-two verses; Mr. Pollock has contented himself with forty. Much of the difference, it is true, may be accounted for by simple, deliberate omission in which we think the translator was fully justified; for in this particular poem there is a certain amount of base metal mingled with the gold. But, even where Mr. Pollock has not actually struck out passages, he has often taken the license of compressing, expanding, and correcting. He has justified himself in so doing by translating faithfully when he chooses, and thereby clearing himself from the charge of incapacity so to translate. For instance, here is the French of the first seven lines of the Muse's speech in our first quotation:—

> Poëte, prends ton luth; la nuit sur la pelouse
> Balance le zéphyr dans son voile odorant.
> La rose, vierge encore, se referme jalouse
> Sur le frelon nacré qu'elle enivre en mourant.
> Ecoute! tout se tait; songe à ta bien-aimée.
> Ce soir, sous les tilleuls, à la sombre ramée
> Le rayon du couchant laisse un adieu plus doux.

Here the sternest literalist can hardly propose any alteration, except perhaps the substitution of "Listen! all's still," for the loose and somewhat conventional "Silence is lord." Elsewhere the alterations show care rather than indolence, as where Mr. Pollock has substituted "her new-born calf" for Musset's "ses faons sont nouveau-nés," and where he has drawn his pen through "Titarèse" and "Oloossone" and the other frippery of the original allusion to Greece in the same poem (the *Nuit de Mai*). We believe, indeed, that the hind does, in rare cases, drop doublets; but Musset is much more likely to have been ignorant of the rule than aware of the exception. But, in his attempt to follow Hugo in loading his verse with sounding proper names, Mr. Pollock has very wisely declined to follow him. Within that circle none can walk without stumbling save the wizard who drew it.

We have said that we are especially glad to welcome this little book as a tribute to the excellence of a poet who has been somewhat ill-treated in England. When Musset lived and wrote, it was chiefly an article of faith with us that there were no French poets, save perhaps Lamartine and Béranger. We have changed all that in the last twenty years; but most of those who have helped to bring the change about have not been well disposed to Musset. They have for the most part been "sealed of the tribe of Hugo," and the tribe of Hugo have never been friendly to the poet for whom others, if not himself, would lay claim to a position alongside of their idol. It is very noteworthy that Mr. Swinburne, whose poetical charity is generally wide, has spoken of Musset, and perhaps of Musset alone among poets of distinctly high rank, with contempt and injustice. Moreover, if there had not been this personal element in the matter there have been other reasons for depreciation. Musset's Byronism is undeniable, and Byronism has not been popular in England lately. Moreover, the pupil imitates the master not merely in certain silly and irritating affectations of manner, but also in wilful disregard of the niceties of poetical form. His exquisite ear and his admirable lyrical talent save him indeed from Byron's worst faults. But still no expert in French prosody, or in the French poetical lexicon, would attempt to deny that Musset's verse frequently seems limp and shapeless beside the bronze of Hugo and the alabaster of Gautier. Nevertheless, no sound and catholic criticism can attempt or desire to depreciate his merits. Putting aside the extraordinary dramatic faculty of which enough has been said, he had yet qualities enough to furnish forth a poet of any but the very first class. Nothing of the kind excels the throbbing passion of "L'Andalouse" or the half-inarticulate melody of "A Saint-Blaise, à la Zuecca." No one, except Heine only, has better mixed playfulness and pathos. Above all, no one has a better right to use his own words:—"Je veux quand on m'a lu qu'on puisse me relire." This is exactly what can be done with Musset. His pages can be turned over night and day with pleasure when the higher and more sculpturesque poetry would

be something of an oppression, and perhaps, though it be blasphemy to say it, something of a bore. With much that is absurd, there is also something that is sound, in M. Taine's famous parallel criticism of Musset and Mr. Tennyson, and the soundness is perhaps best expressed in the concluding words of it—"J'aime mieux Alfred de Musset." We do not lay stress on the comparative, but only on the verb. A certain feeling of affection for the poet and the poetry is unavoidable; and this, if it be not the highest (and it probably is not), is a very high claim to a great poetical position. As a tribute to this position, and an effort to get it recognized in England, these versions deserve a hearty welcome, and worthily complete Mr. Pollock's capital lecture on Musset delivered and published a year or two ago.

ATKINSON'S ART IN GERMANY.*

MR. ATKINSON tells us, in a short preface to his work, that he does not "attempt more than a broad sketch of the varied phases assumed by German art during the present century." He has aimed, he says, not at an exhaustive compilation, but rather at a simple record of his own observations during a period of more than thirty years; and in his book he fulfils consistently the promise thus given. He speaks throughout from personal and careful examination of the things he writes about, and completely avoids the tone of dogmatism which is, and it is to be hoped will remain, the special property of the affected school. Mr. Atkinson tells us what he thinks, but he does not tell us that we are all to think exactly as he does if we do not wish to write ourselves down asses, and though he constantly uses the first person, he uses it simply and naturally. It is possible to disagree with him on many points, as it necessarily must be in the case of a book which covers so much ground; but it is not likely that any one who reads his pages will feel that irritation which a certain class of contemporary writing on art is apt to cause to people who have not thrown in their lot with the lilies and languors of æstheticism.

Mr. Atkinson's opening chapter, or introduction, aims at taking "a general view of the wide and discursive subject, which will be treated in the sequel in detail." His following chapters deal with special localities and with the artists who in each case are associated with them. Each chapter is complete in itself, and instead of seeking some means of making an artificial connexion between them, the author has made it his business in the prefatory chapter to bring "materials somewhat scattered into a collective whole." He traces, that is, the various forms of art which he afterwards describes, to the common origins which observation and reflection have led him to assign to them. He begins by pointing out the fallacy of the argument by which "certain races are tacitly assumed to be æsthetic, and therefore to have given birth to art; and then, again, when certain arts are found to exist, it is inferred that the resident races must be eminently artistic." This, he points out justly enough, amounts to arguing in a circle. It might evidently, Mr. Atkinson continues, "be more to the purpose to consider whether there had not been operative anterior circumstances and causes which made the races what they are; whether, in fact, favouring climate, beauty in outward nature, and ease and luxury of life, had not been, indeed, the primary and generating source of art." In several instances which occur far later on in the book, Mr. Atkinson is, as it seems to us, led away into making somewhat strained applications of this theory, and notably so in the case of the change which he traces in the style of M. Munkacsy; but the main position which he takes up in the chapter from which we quote is certainly sensible and consistent enough. He goes on to say that

> the whole question, in fact, of the relation between ethnology and art is beset, as already said, with doubt and difficulty; so fundamental a point, for instance, as whether the collective art of the whole world, civilized and uncivilized, can have come from one source and can claim a common parentage, or whether it sprang from distinct races and was evolved at distant centres, Germany being one, will perhaps never be determined. The inquiry, as before remarked, becomes in Central Europe the more complex and confused because circumstances have formed the races, and the races in turn have determined the circumstances, and neither alone, but both conjoined, have conspired to fashion what is termed the national art.

Mr. Atkinson goes on to give an account of the many and various causes which he thinks have been at work in producing the phases of art with which his volume deals. His views as to this are in some points open to question, and his stay in Germany seems here and there to have affected his style in writing English; but his closing observations on the connexion between pictorial art and literature strike us as being sound and good.

The author's second chapter, headed "The Rise in Rome," deals with the movement begun "some sixty years ago by a small company of German painters, of whom Cornelius and Overbeck were guiding spirits," and with its antecedents and sequel. Mr. Atkinson divides "the German manifestation," as he calls it, into three periods—the first, or classic period, identified with Raphael Mengs, who went to Rome in 1741; the second beginning with the arrival in Rome of Cornelius, Overbeck, and others; and the third beginning about 1830 and coming down to the present day. "This," says the author, "came as a reaction, and even as a revenge, on what had gone before. Cornelius and Overbeck had flown into the sky; hence the desire was felt for a return to a firm footing on mother earth." Of the German colony at Rome in the time of Overbeck Mr. Atkinson gives an interesting account, and he draws a curious parallel between German and English pre-Raffaellitism. The chapter comes down to the present day, and the chief illustration chosen for it is from Mr. Heilbuth's admirable picture "At the Villa Borghese." The second chapter, headed "Munich," contains, amongst other things, an interesting account of a visit to the late Herr Kaulbach's studio, and deals at considerable length with the system of Herr Piloty, the present Director of the Munich Academy. The author sums up his practice and teaching as follows:—"First, the choice of a subject noble in thought; second, the theme selected to be suited to pictorial treatment." Here, Mr. Atkinson justly observes, is a blow aimed at a mistake which is still too common, despite the teaching of the "Laocoon," that "what is good in poetry must be equally good in painting, whereas the two sister arts come into the world under different conditions. Lastly, the theme having been suitably selected, it remains for the artist, by means of form, by effect of light and shade, and by all possible power of *technique* and *éclat* of colour, to exalt its import to the uttermost." To this Mr. Atkinson adds some remarks upon Herr Piloty's own work, in the course of which he describes the startling effect produced by the diamond in the finger ring of the dead Wallenstein—an effect gained by "the laying on of white in absolute alto-relievo"—but seems to avoid committing himself to any decided opinion as to the value of this method, as employed here and in another picture of which he gives a description. Later on the writer has some remarks which strike us as particularly valuable on a recent development of art fancies, of which he speaks with special reference to Munich, but which is not confined by any means to the Munich school. He quotes from a letter of Mr. Compton's, who says that in 1869, when he first went to Munich, "there was much more of the classicist school in the upper walks of art," and goes on to observe the present preponderance of "technical tricks and pictorial peculiarities" in historic pictures, and the tendency to servile literalism in what are called *genre* pictures. Mr. Compton believes that "the universal recourse to photography by landscape and *genre* artists is at the bottom of a great deal of the heartless realism so much in vogue." Perhaps Mr. Atkinson is a trifle imprudent in quoting, as if it were an undeniable fact, a statement made by his correspondent as to M. Meissonier's and M. Pasini's (mis-spelt Passini's) method of working; but this does not affect the general question of the mania for microscopic pictures which Mr. Atkinson is, to our thinking, right enough in condemning. An instance of the extravagant lengths to which this has gone is given in a letter from another correspondent, Mr. Folingsby, who writes that "nearly all the young artists here paint very small pictures" (to supply the demand created by the passion for Meissoniers), "and to make their work pay, as prices are very low, they generally steal the composition from some old engraving or modern photograph, trusting that it may pass without detection through the difference of handling and colour." One may perhaps allow for the case being a little overstated, but the illustrations which follow are striking and deplorable enough. Mr. Folingsby relates how a clever and distinguished artist in Munich, accustomed to paint on large canvases, satirized the mania for tiny ones by painting and heavily framing a picture exactly the size of a lucifer-match box, which was exhibited, and at once bought by a dealer. This story is, however, surpassed by that of a rich collector in Berlin, who "has sent orders to nearly all the painters of name here in Munich to paint him a picture for the frame which he sends with his order." This frame was one of the silver-gilt buckles formerly worn as hat-bands by the peasants of Bavaria. Comment, as the writer of the letter observes, is needless. This is, of course, only one aspect of the school in connexion with which it happens to be mentioned, and, equally of course, it is not peculiar to one city more than to another. Nor can we quite agree with what seems to be the opinion of Mr. Atkinson's correspondent, that the master is to be held accountable for the excesses of his unsought disciples. "Decipit exemplar vitiis imitabile." M. Meissonier, Señor Domingo, and other painters of mark who have shown that they can paint microscopic figures on microscopic canvases and yet retain their breadth and power of touch, are surely not more to blame than are poets, actors, or musicians, whose success is closely associated with their own bent of genius, and whose unwholesome imitators strive to copy the outward peculiarities of their model, but cannot come near the spirit which has given these their only value. Their case is indeed precisely that of the false herald in *Quentin Durward*, and it is perhaps not an unmixed blessing that our present customs prevent their sharing the fate which overtook him.

The Munich School occupies two chapters in Mr. Atkinson's volume, and he gives the two following ones to Düsseldorf, in the course of which he makes a curious reference to "the relation which I conceive exists between the spiritual phases of German art and the teachings of Swedenborg." What Mr. Atkinson advances here is, we think, fantastic, if ingenious, and is perhaps somewhat out of keeping with the generally plain-sailing plan of his work. But it is contained in a few lines only, and is put forward with the same absence of dogmatism or tiresome insistance of which we have already spoken. In the succeeding chapter on Berlin, Mr. Atkinson recurs to a subject which has been dwelt upon in a preceding chapter, that of the "Wasserglas" process for frescoes;

* *The Schools of Modern Art in Germany.* By J. Beavington Atkinson, Author of "An Art Tour to Northern Capitals," &c. With numerous Illustrations. London: Seeley, Jackson, & Halliday.

and it may be convenient to take his observations together. In one of his Munich chapters he gives the result of Herr Piloty's experiments in this matter. The Director of the Munich Academy has never painted in fresco, believing *Wasserglas* to be much better, especially as regards permanence; he thinks it will resist all influences of climate, and gives the case of a *Wasserglas* picture at the top of the Munich Academy remaining exposed to all weathers without injury for six years. He himself finds the process easy and agreeable. He does not use the silica on the palette, but mixes his colours with distilled water. When the picture is finished, it is rendered impervious and imperishable by having the "liquid flint" squirted over its surface. Herr Piloty believes that in the case of the Maclise wall-paintings at Westminster too much of this liquid was thrown on, so that, "instead of being absorbed into the cement, it came out as a cloud, which did not reveal, but obscured, Nelson and Wellington." Further, he mentions vaguely certain recent improvements, and "is convinced that a great future is opening for these new processes." At Berlin Mr. Atkinson again found the *Wasserglas* process in use, in rivalry with the older fresco method. He sums up the question at this point by saying, "I have never seen in Germany either in fresco, water-glass, tempera, or encaustic, a picture comparable in quality to a pure and simple Italian fresco of the good old time. Kaulbach's water-glass pictures have proved enduring; I have never detected the slightest traces of decay; and when I saw them the other day the composition first completed was as fresh as the last." The writer goes on to point out the indubitable importance of a close and careful inquiry into the relative merits of the various processes.

Mr. Atkinson's volume covers, as may have been guessed from what we have said of it, a great deal of ground, and it is impossible in a review to follow him over more than a limited amount of it. Its value as a book of reference is enhanced by the index given at the end, and its illustrations have been selected with good and catholic taste.

A CONFIDENTIAL AGENT.*

MR. PAYN'S fertility of invention and freshness of style are wonderful. There are writers equally industrious, who are coming continually before the public with no very conspicuous deterioration in the quality of their work. But, though occasionally they show sparks of the ancient fire, they have nevertheless settled down to the steady paces of the hack who sets himself seriously to grinding through a regular routine. Everybody knows the style, of course. You can give a shrewd guess at the cast of a plot which repeats itself with slight and immaterial variations, and possibly you admire the practised art with which your old acquaintance makes familiar ideas assume agreeable airs of originality. We are far from asserting that Mr. Payn is invariably equal to himself at his best. This would be asking too much of any man who writes so much and writes so readily. But we always take up one of his novels with the assurance that it will contain light and lively or exciting reading. He understands the judicious use of strong sensation; and, indeed, he seems sometimes inclined to abuse sensation, in the conviction that he can make improbabilities appear plausible to his readers. For he is a man who is well acquainted with the world, and accordingly he avoids those grotesque extravagances which enliven the fictions of Ouida and her imitators. His books must be rapidly written, yet they are always carefully thought out; and, although the piecing together of his incidents may be strained here and there, the workmanship has more than a show of solidity. Sometimes he has a genuinely brilliant conception, as in *By Proxy*, which is decidedly the best of his recent novels; and the same story exhibits that gift of an active imagination which can give shape and realistic colouring to the phantoms he has conjured up. For, while we have no reason to believe that Mr. Payn has ever gone on an exploring expedition in the interior of China, yet in *By Proxy* he has depicted the Celestials and their country with the well-informed confidence of a leisurely traveller. But perhaps what is most pleasing in his books is their sparkle. He is continually making somebody say a good thing, and somebody else tell a capital story, while he has the knack of turning even commonplace sentences in a manner that carries one easily along from incident to incident. So that professional critics have reason to be grateful to a writer who turns what is too often a drudgery into relief and recreation.

As for this story of the *Confidential Agent*, without vying in brilliancy or originality with *By Proxy*, it is nevertheless above the author's average handiwork. It is thrilling enough in all conscience, though it must be confessed that it draws somewhat freely on our credulity. But we can recall very few of Mr. Payn's books in which there are happier sketches of character in more agreeable variety. There is a little household in a modest little suburban residence at No. 7 Cavendish Grove, which, in the judicious blending of its ingredients, has the piquancy of a well-compounded salad. The master is Mr. Durham, affectionately known as "Uncle Stephen," an elderly gentleman of easy means and extensive and very miscellaneous erudition. He can talk on most subjects, and talk well; and the more recondite the subjects, the more he shines. And, remembering that it is Mr. Payn who is speaking through Mr. Durham's mouth, we are reminded of the stores of promiscuous reading on which the novelist can draw. At home under Uncle Stephen's roof is his nephew, Matthew Helston, the hero of the startling adventure which is to hold us in suspense to the last. Helston is scarcely formed to shine in general society, and he is more likely to go to the wall in the struggle of life than to push his way to position and a fortune. Yet he has genius of a kind, and intense self-conviction of it; and, in spite of his reserve and self-concentration, he is the sort of man to whom we can understand a woman being devotedly attached. The author takes considerable trouble in analysing Helston's temperament, and in bringing out some of the less salient features of his character, with an eye to the trials he is destined to undergo. Subsequently we discern that each of these seemingly trivial touches has its special object, and is intended to explain the different circumstances that deepen the mystery which the novel is to clear up. Helston is a dreamer, a thinker, and an enthusiast; in his obstinate determination to follow the bent of his inclinations he has chosen to quarrel with his bread and butter; and he is possessed with a passion for mechanical invention which even his love for his wife cannot altogether exorcise. Like the abstracted Warner in Lord Lytton's *Last of the Barons*, he has put his whole soul and something more than his spare capital into a marvellous piece of mechanism which is to make the fortune of its master. And having hitherto wasted time, money, and opportunities, and been balked of his most cherished aspirations, and reduced to accept a situation which he considers humiliating, he is naturally embittered. Consequently in his moods of irritation and depression he indulges in language which is remembered to his disadvantage under circumstances of suspicion. Yet, if Matthew Helston had fully realized his domestic blessings, he must have known himself to be one of the most fortunate of men. Mrs. Helston—"Sabey," as she is called in the family—is perfectly charming. Or at least we should have been ready to pronounce her perfect, had it not been for the presence of a sister, who is also a member of Mr. Durham's family. Amy Thurlow, in the sweetness and light of her disposition, sets off her sister's graver, if not more sterling, qualities. Amy earns her bread as a day governess, and so far we are inclined to be prejudiced against her. For we generally suspect the governess of fiction of being strong-minded and something of a feminine prig; showing more than a glimpse of a pair of blue stockings between an aggressively looped-up petticoat and a pair of double-soled walking boots. But Amy Thurlow is nothing of the sort. She is pretty, of course, with a graceful figure; she is thoroughly feminine in every word and thought and gesture; she is ready of wit, and full of playfulness; and yet, as she has afterwards many opportunities of showing, she has extraordinary capacity for action and endurance. We fancy at first that Amy is rather throwing herself away on the young lawyer living next door, to whom she has plighted her hand and troth, and with whom she has arranged to communicate by a code of floral signals. In this private edition of the "Language of Flowers," a rose thrown over the garden-wall is tantamount to asking, "May I drop in to supper?" while keeping the flower, instead of tossing it back again, is the silence that eloquently infers assent. But the shrewd and undemonstrative Mr. Barlow grows upon us as the story develops. He not merely displays the intelligence which should ensure success in his profession, but also shows a generous appreciation of uncongenial character which argues a latent chivalry in his own disposition.

All these good people are set in violent agitation by the incident which turns the paradise of No. 7 into a purgatory, under prolonged tortures of anxiety and suspense. Matthew Helston suddenly disappears, leaving not a trace behind him, or at least nothing but those "clues" which prove delusive to the most experienced detectives. In fact, this reserved, quiet-mannered man had been discharging duties which exposed him periodically to great danger, and which might gravely compromise his character at any time. He is the confidential agent of the great firm of Messrs. Star and Signet, the famous jewellers, and it was his business to have the occasional custody of the diamonds of some of the firm's wealthy clients; for there are ladies, as we learn, like Lady Pargiter of Moor Street, Mayfair, who never can go to bed with easy minds with their precious *parures* in their own repositories. So, when Lady Pargiter came home from fluttering through a round of entertainments, Mr. Matthew Helston was understood to be in waiting to relieve her of her diamonds in exchange for a receipt. These visits were of frequent recurrence; generally they took place towards three o'clock in the morning; and it was not unnatural that the "agent" should become an object of attention to the gangs of watchful confederates who get a living by swindling and robbery. In expectation of an attack which he had always apprehended, Matthew Helston went armed with a revolver; and, by way of further safeguard, was driven by a cabman whom he knew, and believed to be trustworthy. One night Helston actually did disappear, the honest cabman coming back to tell a story which was flatly contradicted by Lady Pargiter, whom it concerned. When a gentleman vanishes with 25,000*l.* worth of jewelry which does not belong to him, the natural inference must be that his honesty has succumbed to temptation. It is one of those cases where *les absents ont toujours tort*, and suspicions gather thickly round Matthew Helston. Damning circumstances, too, conspire to blast his character. A young woman in whom he has been mysteriously and secretly interested is traced to the Continent, in the company

* *A Confidential Agent.* By James Payn, Author of "By Proxy," &c. London: Chatto & Windus. 1880.

of a man who answers precisely to Helston's description, and has been seen endeavouring to dispose of valuable diamonds which in all respects resemble the missing gems. Even worthy Uncle Stephen, though in distress and self-reproach, is driven over to the side of the majority who have made up their minds as to Helston's guilt. In fact, Helston has but two believers left who refuse to hear a syllable to his disadvantage, and these are his wife and his loving sister-in-law. That his wife should cling to her firm faith in him in the face of apparently inexorable facts is natural enough; but Amy Thurlow's affectionate trustfulness rises to sublimity. She does not blink the facts that form the chain of circumstantial evidence; she admits their seeming cogency to dispassionate judges; she even sorrowfully does Uncle Stephen the justice of acknowledging that he could hardly help himself in abandoning faith in his nephew. Nevertheless, for her all that evidence goes for nothing when set against her knowledge of the missing man. He is simply incapable of breach of trust and robbery; he could not have the heart to play his wife false; he may be dead, and Amy will always honour his memory; but, if he is alive, he must be confined somewhere in durance. In either case, the elucidation of the truth can only be for the benefit of the missing man, and so she continues with unflagging zeal to animate the amateur and professional detectives. In a trying and highly-wrought scene she breaks with her lover, though feeling all the time that she is wrecking her prospects of happiness. Of course her self-sacrificing constancy has its reward, and the novel ends as happily as it began. But we shall not forestall the interest of the story by telling how and where Helston was discovered; or by clearing up those mysteries attending his disappearance which seemed to blast his character beyond possibility of rehabilitation.

CHRISTMAS BOOKS.

II.

AMONG the large illustrated books which contain panoramas of foreign countries, *Switzerland; its Scenery and People* (Blackie and Sons, London) seems one of the most commendable. The text is translated and adapted by Mr. Chisholm from the German of Dr. Gsell-Fels. The designs, by German artists, represent landscapes, groups of peasantry, street scenes, and historical events. Portraits of eminent natives of Switzerland are also given, and the majority of the drawings are simple in style and carefully engraved. The tinted woodcuts have a livid and unpleasant colour in some cases; but the smaller woodcuts, plainly printed, are almost models of what this kind of work should be. The view of the Federal Council Hall, Bern, is stiff and has the cold, harsh tones of a pictorial advertisement. On the other hand, many of the vignettes of architecture and of mountain forms, with the sketches of the industries and amusements of the Swiss, are accurate, and completely succeed in attaining their modest purpose. The letterpress is replete with information, and the book would be very readable if it were not a "tablebook."

The Magazine of Art (Cassell, Petter, Galpin, and Co.) is a very varied miscellany. With pretty taste, the obituary notices of dead artists are called "bundles of rue." Short biographies of living artists are illustrated with portraits, drawn on wood. "Pictures of the year" are criticized, and here we have slight sketches like those in Mr. Blackburn's Catalogues. Mr. Soden Smith contributes papers on a pleasant topic, the "Vicissitudes of Art Treasures." It is always pleasant to read about *trouvailles* of buried gold, and here are pictures of the articles recovered, such as the crown of King Rescesvinthus, found by moonlight in the bed of a Spanish mountain torrent. The story recalls the scene in the *Idyls of the King* where Arthur finds the coronet of diamonds on the skull of a king slain long ago. The crown, with others found in the same hoard, is in the Maison Cluny. There are other interesting papers on Needlework, on the Art of Illuminating, on the Ruskin Museum, and similar topics. The book is full of pleasant reading and respectable en-

Mr. Caldecott has chosen this year to adorn the *Song of Six-* ith his humorous and charming designs (Routledge and Sons). Nothing can exceed the enthusiasm of the huntsmen as they start in pink from a pink Georgian mansion. They all blow big horns in the avenue; and, in short, are so obstreperous that they never find a fox. They have adventures with scarecrows, children, and young lovers, whom they misconceive in the manner of Don Quixote:—

> They hunted and they hollo'd, and the first thing they did find,
> Was a tatter't boggart, in a field, and that they left behind,
> Look ye there!
> One said it was a boggart, and another he said "Nay;
> It's just a ge'man farmer, that has gone and lost his way."
> Look ye there!

The *Song of Sixpence* is more familiar; and the children, the old labourer, the royal household, the childish King and Queen, the pretty maid, and the gallant grenadier are all drawn with much humour and originality. The prettiest scene represents a boy and a little girl catching blackbirds in a trap on a snowy day.

A readable introduction to Norse mythology is very much needed. Yet *Asgard and the Gods* (Adapted from Wagner by M. W. Macdowall. Swan Sonnenschein and Allen) is scarcely the book we desire. It is meant for boys and girls, apparently, but the language is too stilted. "According to Germanic intuition, Life and Nature formed the basis of the existence and action of these divinities." What does a child know about "Germanic intuition"? The author cannot tell the good old tales in a plain, straightforward style, but must drag in his moral reflections and the facile commonplaces about "the beneficent god of summer conquering the destructive tempest with his own weapons." There is nothing more tedious than the eternal repetition of these explanations, which we believe to be entirely erroneous. Our knowledge of Norse mythology, of its component parts, and of the processes by which ideas, possibly Christian, got blended with older and even with savage myths, is at present very imperfect. For children, the stories should be told as stories simply, without "oppositions of science, falsely so-called," without the introduction of hypotheses which are beginning to be tried and found wanting. It is only by agile skipping that a boy or girl will get pleasure out of *Asgard and the Gods*.

Men of Mark (Photographed from life by Lock and Whitfield. Sampson Low).—The "Men of Mark" seem to be chosen in a very haphazard fashion; but, such as they are, their portraits are startlingly faithful, though few among them seem to have troubled themselves to make an agreeable impression. Canon Liddon, however, is at his very pleasantest; an amusing recollection at the critical moment has proved too much for Sir Julius Benedict; while Mr. Alma-Tadema is gazing with incredulous horror at something which, could we see it, would doubtless prove to be an introduction of Gothic details into a Roman interior. A careful observer of character will easily read between the lines, and discover from the sit of the coat and the way the whiskers are trimmed to whom the admiration of society is dear, and who is content with merely being comfortable. Mr. Browning is far more recognizable than in the fine painting of him now exhibited by Mr. Watts in the Hanover Gallery, and we shall all welcome with pleasure the excellent portrait of Mr. Tom Taylor.

Elfin Hollow (F. Scarlett Potter. S.P.C.K.)—The art of the country stands a bad chance when children are brought up on such terrific pictures as are scattered freely through *Elfin Hollow*; and of all branches of art the drawing of the figure is in most danger. Animals are sometimes decently drawn, and landscapes are occasionally tolerable; but the unfortunate specimens of humanity have their arms and legs distorted in such a manner as to make them only fit for a Cripples' Home, while the expression of their faces would be considered vacant in an Asylum for Idiots. The unhappy reader is never allowed to forget or ignore these monstrosities, for his attention is constantly being called to them in the letterpress. "In the picture you see a lady who has been caught in a thunderstorm, galloping across a common"—we should have said it was a Burmese jungle. "Look at the picture opposite" is again remarked, and, lacking the strength of mind to divert our eyes, we behold an infant in a cradle which is surrounded by rolling clouds of fire and smoke, like what we generally associate with painted windows and the apotheosis of Elijah. "You may look at Peter's wife in the picture on the preceding page, and see whether she is a person into whose hands you would like to fall." She is not indeed. The story, which is a mixture of childish adventures and talk about beasts, is not much more entertaining than the art.

His Father; or, a Mother's Legacy (S. K. Hocking, F.R.H.S. Warne and Co.)—This book has many peculiarities, among which may be reckoned the title. The hero, Harry Thorne, is the son of a worthless and drunken father, who has deserted him, and on her death-bed his mother begs the boy to look after the parent if they ever meet. This they do in Wales, where Harry is living with his grandfather in peace. He is kidnapped, and made to lead a wandering wretched life for many years, though he never yields to the temptations around him. Then the father has an accident, and Harry takes advantage of this to induce his grandfather to receive them both. In the course of time we are told "all misunderstanding" between Owen Thorne and his father-in-law "had been smoothed away"; which, considering that the former had robbed and twice tried to murder the latter, says a good deal for the old gentleman. Harry becomes an artist; and one day, hanging about his own picture at the Academy—as artists so invariably do in novels, and never in real life—he comes across the object of his early affections, and all are happy for ever after. The illustrations to this book are almost worse than any we have seen yet. In p. 147 there is one called "Harry rescues Douglas," in which a tall boy is standing in a shallow pond, with the water not up to his knees, holding up a yet taller lad. In the letterpress this act is described at much length. We are told that the heroic rescuer "struck out," and contrived to get the drowning boy to the bank, "how he never knew." *Solvitur ambulando.* They walked ashore.

Tim Trumble's Little Mother (C. L. Mateaux. Cassell).—It seems odd that in writing this pretty little story the author should have thought it necessary to interpolate, chapter by chapter, the account of a nest of small birds, which has little or no connexion with the human part of the tale. It lengthens the book in an undesirable way, and distracts the minds of the children. The sentences are often hopelessly long and involved, but we are glad to say that the pictures are a great improvement on most of the illustrations that we have been looking at.

The Fireside Annual (The Rev. C. Bullock. "Hand and Heart" Publishing Office) contains an immense deal of varied matter and many portraits of extraordinarily plain old gentlemen.

Miss Giberne's story of "A Nameless Shadow" is the history of a family who, thinking they have a forger for an uncle, ultimately discover that it is their father who is the felon.

Frank Powderhorn (J. Sands. Nelson) was a boy whose soul was set upon colonizing in Buenos Ayres. It is needless to say that he and the rest of the crew were wrecked on the passage thither, but nevertheless get safely to land, where we find them shortly after singing ditties of twenty verses. Much information may be gained as to the country and natural history of the Pampas, where the author tells us that he spent some time. The small illustrations are good, but we cannot say so much for the more pretentious ones.

Gems of National Poetry (Compiled by Mrs. Valentine. Warne and Co.)—This is a well-chosen selection of poems suitable for children, and containing pieces from the less known and more modern poets.

The Eastern Archipelago (Described and illustrated by W. Davenport Adams. Nelson).—Those who are acquainted with the works of Mr. Davenport Adams will know exactly how much he means when he says that his book is "largely indebted to the labours of Wallace and Bickmore."

Familiar Garden Flowers (Figured by Edward Hulme, and described by Shirley Hibberd. Cassell, Petter, and Co.)—The pictures are carefully drawn and generally well coloured; but Mr. Hulme has not always been successful in his red and purple flowers, and his greens are often painfully vivid. The letterpress will be useful to amateur gardeners.

Sunday Reading for Young and Old (Wells, Gardner, and Darton).—The old people who find entertainment in this book must be very simple-minded, but it may please children, though the illustrations will appal any who have the most rudimentary taste for art.

Grandmother's Recollections (Grandmamma Parker. Sonnenschein).—These are very short stories with excellent morals. They may improve small children, but will hardly interest large ones.

Home Words (Edited by the Rev. Charles Bullock. "Hand and Heart" Publishing Office) contains the usual sort of Sunday reading supposed to be meant for poor people. We should like to know how far this kind of literature is really read and appreciated by the class for whom it is intended. For our part, we should feel shy of reading out these tales in cottages or workhouses, as they have an air of "talking down" about them, and a touch of "I am holier than thou" which the hearers might resent.

Fabled Stories from the Zoo (Albert Albery. Sonnenschein) are autobiographies of various animals and birds, and are useful as suggesting to children that animals have lives and feelings of their own.

Voyages and Travels of Count Funnibos and Baron Stilkin (W. H. G. Kingston. S.P.C.K.)—In plain words, this is an account of travels in Holland; but it would have been not the worse had the travellers been called by more commonplace names.

Not Quite a Peck of P's (Sator. Simpkin, Marshall, and Co.) is a mild little tale about two sisters, who, after living in poverty, become affluent through the arrival of their father from Australia. The "P's" are such virtues as piety, prudence, propriety, and the rest. Hence the expression "Mind your p's and q's."

Messrs. Griffith and Farran send us a number of little volumes—the "Tiny Natural History Series"—stories about clever animals, told in easy words and copiously illustrated. These little books will tempt children to read, and teach them, by the awful warning of "Johnny's fall," not to rob the nests of birds, except, of course, birds who build on the ground, where there is no danger that the nest-robber may break his leg.

The Princess Myra is rather a didactic fairy tale, by Mr. Scarlett Potter (S.P.C.K.) It promotes Christian knowledge rather than a sound theory of fairies, who, we regret to say, have no morals at all, and a religion the reverse of theistic. Among the "good folks," Princess Myra had adventures very unlike those of Thomas of Ercildoune, and she became serious and contented, whereas he was consumed with longing for the arrival of the mystic white deer that led him back to fairyland. Christian knowledge is an excellent thing in itself, but piety might leave the fairies to their own pagan devices. We seem to have seen the pictures before, and they look like old *clichés*.

AMERICAN LITERATURE.

THE debts that science and literature owe to the Government at Washington and to the Engineering Department of the Federal War Office are great and well known, if only for the publications that have recorded for the public benefit the various surveys undertaken and carried out with unsparing diligence and marvellous completeness at the national cost. No year has passed in which we have not had to acknowledge more than one such obligation, especially on the part of geographers and geologists, often for researches which hardly could, and certainly which would not, have been undertaken, at any rate for a generation to come, by private persons or even by scientific societies. There is nothing limited or petty in the views of the Federal Government or in the work of its officers; the labours of the latter and the liberality of the former might serve as an example to the most diligent of scientific enthusiasts or the wealthiest of societies. How much both have done for geographical science in general, and for all the studies connected with geography, only specialists are fully aware. The work immediately before us (1) is a signal specimen of the thorough-going way in which the work is done, and shows how completely the most eager and enthusiastic specialists in the service of the Union can rely on the willingness of their Government to incur any expense necessary to render available to the world at large even the most purely technical of their labours. That the Naval Department at Washington should publish in the completest form, and with every aid that the art of the printer, the photographer, and the engraver could lend to render the researches of the explorer intelligible even to unscientific readers, all the results of their dredging and sounding expeditions in the Gulf of Mexico and elsewhere, is only what those who know the usual practice of the American Government would have expected. But even from that Government we should hardly have looked for this elaborate and beautifully illustrated memoir intended only to explain, for the benefit of those engaged in the same pursuits, the methods and instruments employed, the difficulties that have been encountered, and the manner in which they have been overcome. All the details of the machinery, from the sinkers attached to the sounding-lines to the ship herself, her general and special fittings, are not merely explained minutely in the text, which occupies some two hundred quarto pages, but are delineated in innumerable plates and in several beautiful photographs. The book is hardly a contribution even to the general literature of the subject. It tells nothing of the results of the patient dredging and sounding work performed by its author and his comrades or subordinates. That has been done elsewhere. It is far too elaborate and technical to be read by those who are most interested in the discoveries made by such expeditions as those of the *Challenger* and her foreign co-operators. Even specialists care rather for results than for the means by which they have been accomplished, and are satisfied with a comparatively brief and simple account of the latter. This book can interest only those who have been or may be actually concerned in the work, or in fitting out past or future expeditions; and how limited the number of such readers must be it is easy to understand. It is vain, we suppose, to hope that for long years to come even the most advanced and most enlightened of European Powers will take a tithe of the pains that America has taken at once to encourage her scientific servants to do their very best, and to render the fruit of their labours and researches useful to others. But at least it behoves us, however shamed we may be by an example so very far ahead of us, worthily to acknowledge it; and if, as we fear, diplomacy takes little care suitably to recognize such international courtesies, it is the more incumbent on the representatives of science and literature to speak of them as they deserve. This must be our excuse, if excuse be needed, for dwelling so often and so fully on the subject.

It so happens that two works on the American stage, of very similar scope and purpose, though widely different in execution and interest, reach us at the same time—the only books of anything like equally ambitious and elaborate character on the subject that we remember to have seen. One (2) records with extreme minuteness, and with a patience on the part of the author that may seem to deserve, but is perhaps hardly likely to receive, equal patience on the part of the reader, all the experiences of an actor and manager in the course of something like forty years. Mr. Ludlow has acted in nearly every part of the United States, has managed theatres in nearly all their principal cities, and necessarily under the most varied conditions, from a barn in Vicksburg to a first-rate theatre in New Orleans, from an embryo wooden structure in a village of wooden huts in the Far West to a building whose magnificence has seemed even to civic pride worthy of the same place when it had become a great commercial emporium. All his experiences, professional and personal, as manager and actor; all his business difficulties; all his encounters with over-ingenious builders, landlords, money-lenders, and rival managers, with over-sensitive and over-exacting actors and actresses, are set forth with a fulness which seems to imply that in the midst of unceasing labours the author must have kept a minute diary with a view to some such publication as the present. Almost any page of this large and closely-printed volume is worth reading and readable; but the whole, unfortunately, is almost beyond the perseverance and diligence of a reader, however deeply interested in the details of theatrical management and in the history of the American stage. Such minuteness of detail, such prolixity of narration, is, as we have often remarked, a common characteristic of American works on special topics. Even actors and actresses must, we should think, find the perusal of Mr. Ludlow's volume somewhat tedious before they have got through a third of his elaborate narrative, interspersed though it is with curious experiences and lively personal criticisms. This cannot be said of Mr. Murdoch's less weighty and less coherent, but much more readable, and, we think, not less instructive work (3). Even of this, however, one-

(1) *Deep-Sea Sounding and Dredging: a Description and Discussion of the Methods and Appliances used on board the Survey Steamer "Blake."* By Charles D. Sigsbee, Lieutenant-Commander, United States Navy. Washington: Government Printing Office. London: Trübner & Co. 1880.

(2) *Dramatic Life as I Found It.* By N. M. Ludlow, Actor and Manager for Thirty-eight Years. St. Louis: Jones & Co. London: Trübner & Co. 1880.

(3) *The Stage; or, Recollections of Actors and Acting, from an Experience of Fifty Years: a Series of Dramatic Sketches.* By James E. Murdoch. Philadelphia: Stoddart & Co. London: Trübner & Co. 1880.

half might perhaps be cut out with advantage, at least as regards an English public. American readers may possibly take a greater interest in names with which even the most devoted theatre-goers on this side of the Atlantic are unfamiliar. But Mr. Murdoch, who knows the English stage, and has enjoyed opportunities of making in his own country the acquaintance of many leading English performers, devotes almost as much space to them as to his own countrymen; and not a little that he has to tell of the Kembles, the Keans, and the Mathewses, as well as of living celebrities, will be as interesting to the English as to the Transatlantic public. The book is one that can be taken up and laid down, opened at almost any point and closed almost anywhere, read through by instalments and at leisure in the library, or turned over to amuse a few waste minutes on a drawing-room table, with equal, if moderate, enjoyment in either case.

It will be a matter of some little surprise to persons unfamiliar with American law to learn on American authority that the position of the insane, or rather of those alleged to be insane, is worse in the United States than in Great Britain. How dangerously lax is our own law, how completely we owe what few imperfect securities have been introduced into it to recent statutes, all persons familiar with the subject are well aware. On this, as on other points, the older States of the Union have inherited our common law, which, in regard to insanity, hardly deserves the name of law at all, being simply a chaotic collection of decisions and traditions derived from a period of utter ignorance and barbarism. The older States have not, as have many of the newer, codified their system, and it appears that even in Massachusetts there exists no such provision for State control and supervision of private asylums as forms the only check on the most scandalous abuses here. That, under such circumstances, humane and public-spirited men should find it necessary to establish an association for the protection of those whom the worst of human misfortunes has rendered unable to protect themselves will surprise no one. Judging by the terse practical prospectus it has published (4) we should say that the Society just started in Massachusetts for this purpose is likely to proceed in a sensible, prudent, and effective manner, and we wish it all success in its efforts to inform and enlighten the public.

Mr. Oswald has given a somewhat meaningless and affected title to a readable book (5). The scene of his adventures and rambles is one of the least known parts of the semi-civilized world. There is little in the character, however much there may be in the scenery and climate, of inland Mexico and Central America to attract travellers, and there is very much to deter them. The coast country and seaport towns, which are better known to foreigners, and especially to citizens of the United States, are, as the author found, too much infested by malarial disorders, and especially by the worst of all such diseases, yellow-fever, to be safe or agreeable resorts. Few persons choose to remain there except those whom official duty or special commercial opportunities have drawn thither; and those who may chance to visit them in the course of extensive travel are little disposed to prolong their stay, while few of them are adventurous or inquisitive enough to follow Mr. Oswald's course, and take refuge from the pestilential atmosphere and intolerable climate of the lowlands in the mountainous wilds of the interior. Whether the latter are so well worth visiting as the author would fain represent them—still more, whether any traveller will be disposed to imitate his example, and spend months or years there—we may doubt. There is no doubt that a country so little trodden, a people so little known, must afford matter worth writing and reading about. The book might have been made more instructive and not less entertaining with a little more of pains and taste; but, on the whole, it is worthy of the opportunity which the author has enjoyed—a somewhat rare one nowadays—of describing to the public a region and a people almost unknown, and at any rate unfamiliar.

The same cannot be said of Colorado (6), than which no part of the United States has been during the last ten years more often or more fully described. In the previous decade its population had, on the whole, considerably declined, the superficial gold having been in great measure used up, while the deeper mines had hardly been brought into working order. At present the latter have been extensively explored, and are largely and profitably worked. Silver and other minerals contribute very greatly to the wealth of one of the richest of the new States of the Union. Cultivation, especially stock-raising, has been widely spread, and is constantly extending; and the high and dry climate presents attractions to invalids and others which even such alarming reports of lawlessness and crime as, since the publication of this book, have more than once been received from Denver and other cities do not appear seriously to countervail.

Mr. Abbott's *Hints for Home Reading* (7), a series of essays by different writers, are of very various value. One or two chapters are thoroughly sound, substantial, and practical; one, at least, is so much the reverse that we were at first puzzled to know whether its recommendations were or were not to be taken seriously. Perhaps the best in the collection is that which deals with the actual rather than the possible use of literature, pointing out how very small, compared with the enormous multitude of nominal readers, is the circulation of those books which "everybody reads," and suggesting, we fear with too much truth, the inference that nine in ten of those who can, and think they do, read, read little or nothing but the newspapers, and chiefly the worst parts of those. Another sensible critic hardly vindicates the title of his chapter. He fails fully to explain *why* young people read trash, or at least why they read little else. But he shows what a tremendous provision of trash, always worthless, generally pestilent, and often morally poisonous, is provided for their reading, and, since it presumably pays, must find purchasers by the thousand and the million in American homes. The case is bad enough in this country; in the United States, where parental control is much more limited by fashion and opinion, and does not appear to extend to a careful supervision of the reading even of young ladies, it is, if we may trust Mr. Abbott's statistics, very grave indeed.

Mr. Hopkins's *Comic History of the United States* (8) contains as little material for laughter as most other laboured comedies or farces of the kind. It is very far below even those comic histories of Rome and England which were not the best of the earlier productions of *Punch*.

Mr. Stedman's little sketch of the literary character of *Edgar Allan Poe* (9) is tasteful and sensible, and has the rare merit of brevity. We are not quite sure that its accuracy can be in all respects relied on. Mr. Scudder's *Stories and Romances* (10) will fulfil what seems to be their modest purpose, that of amusing the leisure hours of adult railway travellers. Miss Alden's *Stories and Ballads* (11) may do the same for their junior companions. The lady's prose is better than her verse, but both have at any rate the merit of innocence. The authors' names dispense us from the duty of criticism in an article like the present on Mr. O. W. Holmes's *Iron Gate* (12) and Mr. Longfellow's *Ultima Thule* (13). The same may be said of Mr. Aldrich's Lyrics and Sonnets (14), taken from works which have already fixed the writer's position among American poets. Mr. Snider undertakes in two solid volumes, including some nine hundred closely-printed pages, to "unfold the system of the Shakespearian Drama" (15); to show each play as a whole, to group cognate plays into a higher whole, and, finally, to "sum up Shakespeare." An aim so ambitious will, "if successful," as the author says, place him at once at the head of that enormously long list of Shakspearian commentators of which at present, in time at any rate, if not in diligence or elaboration, he is the last.

Mr. Ferris's treatise on Artificial Incubation (16) is interesting to the general public as showing the extent to which poultry farming is being carried in America, and as indicating an extensive and decided, if not general, preference of the artificial to natural incubation.

The Buckeye manual of Cookery and Housekeeping (17) has passed beyond the stage at which criticism can be required, at least so far as the public for which it was primarily intended is concerned. But there is very much in American cookery that English housekeepers would do well to borrow; and we know no volume that contains a better account of the peculiarities of Transatlantic cookery, of the merits and materials of hundreds of national dishes with which even travellers make but a limited acquaintance, but which on the whole seem to deserve their popularity, and of the practical expedients by which labour is saved and success secured in Transatlantic kitchens. Such a work is the more likely to be generally useful because American households are for the most part small, economy is nearly always a matter of moment, and service is by no means either cheap or good. On the other hand it may well be that what can be easily and thoroughly accomplished where the mistress of the house superintends the cooking herself is beyond the capacity or the ambition of cooks not personally interested in the results of new and troublesome experiments.

IRELAND.

LORD GRANVILLE'S speech at Hanley contained a promise that on the meeting of Parliament the Government will introduce a Bill which he slightingly describes as a rough-and-ready measure. It is much to be regretted that Lord GRANVILLE should have taken the opportunity of extenuating the shameful anarchy which the Government has unaccountably tolerated in Ireland. There are, according to Lord GRANVILLE, fewer murders, in proportion to the population, in Ireland than in England; and he also boasts that the number of Irish murders is at present somewhat smaller than in former years. It is not expedient to confuse the distinction between isolated crimes and the deliberate and concerted wickedness of large communities. When Mr. BOYLE was murdered, the demagogues of the Land League, including their leader, virtually apologized for the outrage by declaring that the assassination would not have been necessary if a branch of their revolutionary [illegible] had been previously established in the neighbourhood. Mr. PARNELL tacitly, and probably with sufficient reason, assumed that the audience which he addressed consisted of accessories before or after the fact to a brutal murder. The popular exultation at the unprovoked assassination of Lord MOUNTMORRES amounted to a confession of common guilt. Even if Lord GRANVILLE is correct in his assertion that there are fewer persons murdered in Ireland than in England, the number of Irish murderers is beyond comparison greater. For the purpose of judicial or criminal inquiries it is proper to ascertain the statistics of actual murders, but the moralist, and perhaps the statesman, would be more seriously interested in the enumeration of direct and indirect accomplices. In order to support a paradoxical contention Lord GRANVILLE confined his comparison to murders. Threatening letters, brutal assaults, torture of contumacious tenants or purchasers, and maimings of cattle, are reported with increasing frequency from Ireland, while such crimes are almost unknown in England. As Lord SALISBURY pointed out in his speech at Woodstock, every day brings news from Ireland of new districts and new counties being brought under the dominion of an occult or, as Mr. GIBSON preferred to call it, an open and daring, society, which defies Government, and does not hesitate to seek its ends by assassination when torment fails. Lord SALISBURY hardly overrated the dangers created by the success which has attended this society's reign of terror, when he said that, if "the "philanthropic dawdling" of Ministers continued, "it "may well be that the English people will be placed "face to face with the alternative that they must either "subjugate Ireland or separate from her." The production of remedial measures for discontent without a previous insistence on restoring order in Ireland could not but serve to encourage violence and oppression. Even in the case of murder Lord GRANVILLE'S argument had been anticipated and conclusively answered by Mr. GIBSON. The conspirators have no need to use their favourite means of oppression when they have already accomplished their ends. Having established a reign of terror, and having effectually prohibited over large districts the payment of rent, they might afford to discontinue carding and mutilation of cattle, as they have partially suspended the practice of assassination. The measure which Lord GRANVILLE contemptuously promises will be a partial and hasty performance of a paramount duty which has hitherto been neglected in deference to Mr. BRIGHT and Mr. CHAMBERLAIN, and perhaps to Mr. GLADSTONE himself. The Decalogue, and the criminal codes of all ages and countries, are in the same sense rough-and-ready measures.

Although the Ministers are probably indifferent both to the remonstrances of competent observers and to the attacks of their political opponents, they can scarcely fail to observe the disapproval of their policy which is expressed by some of their most zealous supporters. The resolution to introduce a rough-and-ready measure may not improbably have been determined by the reports of speeches delivered in different provincial towns. Mr. LEATHAM, who during his long and able [illegible] of Liberal doctrines has certainly [illegible] erred [illegible] of excessive moderation, lately [illegible] to [illegible] his astonishment at the [illegible] which [illegible] allowed to crime in Ireland, and his [illegible] that it was necessary to [illegible] and protect the rights of property. Lord ARTHUR RUSSELL, a thoughtful and consistent member of the party to which he hereditarily belongs, in answer to Mr. BRIGHT'S bold statement that force was no remedy for political and social disorders, remarked that force was the proper and only remedy of anarchy. Mr. COURTNEY, one of the most thoroughgoing Radicals [illegible] House of Commons, lately delivered a highly [illegible] on the condition of Ireland. Referring to the [illegible] speeches of Mr. BRIGHT and Mr. CHAMBERLAIN, [illegible] their subsequent pressure on the Cabinet, Mr. COURTNEY declined to submit his judgment to "one or two persons "of eminence" who, "sitting at ease in England," may have registered a vow that under no circumstances will they consent to exceptional methods of maintaining order in Ireland. No recent speaker has described with greater force the frightful tyranny which the Government has hitherto refused to interrupt or discountenance. Mr. COURTNEY fails to understand why the sale of arms should be openly allowed, and why notorious criminals and other assassins should pursue their vocation in perfect security, although their persons may be known to the police. It would be little matter if a measure for protecting life and liberty were rough, if only it were ready. The Government will carry any Bill which it may propose for the preservation of the peace; but in its dread of popular clamour it is straining the allegiance of its most loyal supporters.

Sir STAFFORD NORTHCOTE'S speech at Brecon was not remarkable for vigour, and it is difficult to understand why he should have paid an enthusiastic tribute to Mr. PARNELL'S energy and eloquence. Mr. PARNELL undoubtedly possesses considerable ability, but his moral peculiarities qualify him for his present task more conspicuously than his intellectual gifts. Renunciation of all scruples and restraints has been as successful in the promotion of Irish anarchy as formerly in the prevention of free Parliamentary debate. It was scarcely consistent with Sir STAFFORD NORTHCOTE'S usual prudence to announce that the so-called "three F.'s" are to be interpreted as "force, "fraud, and folly." It is still proper to assume that the Government, notwithstanding its unpardonable and selfish neglect of duty, may propose a Bill on Irish land tenure which, if not strictly just, may nevertheless, on a balance of considerations, be deemed expedient. The leader of the Opposition would do well to reserve himself for a dispas-

sionate and impartial consideration of proposals which he will at last be at liberty to reject. It is impossible to deny that arbitrated rents, permanency of tenure, and tenant right are, notwithstanding obvious and possibly fatal objections, recommended by Irishmen of undoubted knowledge and undisputed probity. A short pamphlet published by a body of gentlemen who have adopted the title of the Land Reform Tenure Committee consists principally of a recommendation in favour of the questionable "three Fs." The Irish Land Committee arrives at exactly opposite conclusions, which are explained and defended in Dr. WEBB's argumentative pamphlet. There is no doubt that the recognition of a saleable value in an occupancy is theoretically inconsistent both with the complaint of exorbitant rents and with the demand for an arbitrated rent to be fixed without injustice to the landlord; but, in so complicated and difficult a controversy, it is judicious to attach considerable weight to authority. The list of the General Irish Land Committee includes the names of many of the principal proprietors in Ireland, and it is not confined to one political party. The Land Tenure Committee consists of three or four and twenty members, some of them highly qualified by capacity and experience to form a sound judgment on the questions which they discuss. Lord MONCK, formerly Governor-General of Canada, has for ten years administered as Chief Commissioner the estates of the disestablished Irish Church; Lord EMLY and Sir W. GREGORY are resident landlords and have held office at home or abroad; Lord POWERSCOURT is a large landowner; Judge LONGFIELD has perhaps, as Judge of the Landed Estates Court, greater knowledge than any other living person of the relations of Irish landlords and tenants. His opinion that peasant-proprietorship would render agrarian murders more frequent and more brutal is quoted in Dr. WEBB's pamphlet. It is not a little perplexing to find Mr. LONGFIELD's name among the Land Tenure Reform Committee, and to observe that Lord MONCK, Lord EMLY, and Lord POWERSCOURT belong to both the rival Committees. Sir W. GREGORY is one of the Land Tenure Reform Committee, but his name does not appear on the Irish Land Committee. The objects of the Irish Land Committee are principally defensive. The Tenure Committee proposes the institution of a Court of Tenures, which is to have power to give tenants fixity of tenure at rents to be determined by the Court, and the right of selling their interest. Whatever plan may be proposed, the rights which must in any case be established or recognized will be worthless if they are not enforced. There will be no security against the continuance or revival of the Land League, against interference with the payment of rent, or against the threats and outrages by which the demagogues and their followers enforce their decrees. Least of all will it be possible to ensure the performance by the Government for the time being of its most sacred duties if they seem incompatible with its political interests.

JOSEPH II.

THE centenary of the Emperor JOSEPH II. has just been celebrated at Vienna. It is now a hundred years since he succeeded his mother MARIA THERESA, and ten years later he died, leaving, as he said, behind him the memory of one who, with the best intentions, had accomplished nothing. It was natural that he should take this desponding view of a life which had been one long struggle to do something great, and which had ended in doing nothing at all. He had been a reformer, and his reforms had vanished, or had seemed to vanish, into air. Still he was a reformer, and although he had to own that he himself had failed, he seems to have comforted himself with the dream that the day would come when his aims would be realized. When he was asked to sanction the erection at Buda of a statue in his honour, he replied that the time to erect such a statue would only have come when law and religion worked together and the people had been made happy. Instead of a statue, he has a centenary festival; and, could he see what is now going on, he might be content to own that the time he anticipated had arrived, and that Austria had in a hundred years got most of the good things which he had tried to force on her in ten. He himself had found that the way in which he went to work was the wrong one; but he was only working after the fashion of his time. It was the day of autocratic reform. There was a stir throughout Europe, a newborn sense that things were wrong; and men who felt the impulse of the movement, and happened to have great or supreme power, set themselves to the task of ordering a new and better state of things, with the light-heartedness with which they might have ordered a new coat. JOSEPH II. is known as the type of the over-hasty autocratic reformer of the eighteenth century, because his high position made him the easiest example of the character to observe and to remember. But he had abundance of companions in what was supposed to be beneficent violence. STRUENSEE in Denmark, and GUSTAVUS III. in Sweden, went to work in exactly the same way and with much the same result. If JOSEPH confiscated the possessions of religious corporations, CATHARINE of Russia did exactly the same thing. JOSEPH's brother LEOPOLD nearly came to an open rupture with the Papacy by the reforms he wished to introduce in Tuscany, and he alike used his supreme powers and gratified the humanitarian spirit of the age by inventing the Leopoldine Code, which was the first beginning of the reform of criminal law in Europe, and actually survived its author. Even a new Sultan began his reign by going about disguised among the common people that he might make himself acquainted with their wants, their sufferings, and their aspirations. The freaks of beneficent sovereignty degenerated occasionally into the most ridiculous shams, and when JOSEPH accompanied CATHARINE on her journey to the Crimea, improvised villages, surrounded by flocks and herds driven there for a day, welcomed the travellers at every halt in what was ordinarily a desert, only to disappear when they had gone. Crowned heads, or Ministers who had supplanted them, everywhere thought they had a mission to create instantaneous prosperity, even if it were only created by way of a practical joke.

This reforming movement from above came to very little. As FREDERICK the GREAT said of JOSEPH, he always took the second step without having taken the first. This is a fault to which men with missions are always prone, and it was inevitable that an autocratic reformer should fall into it. No man can be at once in a hurry and wait. Then, again, all these autocratic reformers had other things in their heads. They had their schemes of national or private aggrandisement. JOSEPH himself, who was the most sincere and single-hearted reformer of them all, was busy during his mother's lifetime in partitioning Poland, and after her death in trying to snap up Bavaria and plunder Turkey. A sovereign of that day who had a mission to reform had also a mission to get hold of any inch of Europe that he could acquire by force or fraud. From the cradle to the grave he was inspired by the persuasion that he was bound, if he meant to be a sovereign at all, to prove himself able to get hold of something that belonged to somebody else. FREDERICK the GREAT showed that he was great by the strength with which he held this persuasion, and by the tenacity with which he carried it into effect. JOSEPH and his reforming brothers were the precursors of the French Revolution, not only in the sense that they started the system of violent abolition of abuses, but also in the sense that they always wanted to get hold of the largest area possible in which to apply their notions of what was good. The essential aims of that great movement of the last century which spread through Europe, has never ceased to spread, and is still spreading, and which, for the sake of brevity, we couple with the name of the French Revolution, were three. They were the assertion of the supremacy in temporal matters of the State over the Church, the abolition of the legal privileges of the aristocracy as a caste, and the creation of a systematic and intelligible body of laws. In the prosecution of the first two of these aims, the impulse came to Europe from England; in the prosecution of the third it came from France. JOSEPH issued a series of inoperative edicts, some obviously foolish, many obviously harsh. But his aims were substantially those which were subsequently embodied in the general movement of Europe. And the time may now be said to have come when he can have a statue set up in his honour or a centenary festival instituted to recall his memory, because the reforms of which he dreamt, and which he conceived in a singularly crude form, have been realized in Austria. Prince BISMARCK is always complaining that laws regulating the position of the

clergy more stringent than any he has imagined to be possible in Germany prevail in Austria without a murmur from the Vatican. The middle classes of Austria hold their own against the nobles, and although Austria has a great, an old, and a rich nobility, this nobility, like the English nobility, has no legal privileges. Lastly, Austria has a body of law which contents the people, and is supposed to be framed on the most scientific principles; and Austrian jurists have established so high a reputation that the Austrian Judge of Appeal in Egypt has been elected and re-elected by the voice of his colleagues to preside over the supreme tribunal.

As things have turned out, it is not a statue that is being set up in Buda in honour of JOSEPH, but a centenary festival that has been celebrated at Vienna. The Viennese have much more reason to cherish the memory of JOSEPH than the Hungarians can have. JOSEPH, in addition to introducing reforms and grabbing territory, set himself to a third task—that of Germanizing the possessions of the Austrian Crown. In his younger days he visited France, and he was struck, above all things, with the compactness of France, and with the completeness with which France was French. With him to admire was always to imitate. He, too, would have a compact territory, and that compact territory, as he was a German, should be German. He was quite ready, directly he thought he had a chance, to give up the remote Austrian Netherlands, provided he could get Bavaria in exchange. It seemed so pleasant to him to round off his dominions, and to round them off by enclosing in the ring a fine piece of contiguous land inhabited by Germans. He would not hear of the independence of Hungary. He would not be crowned as King, and audaciously sent for the sacred iron crown to Vienna, and kept it there. He divided Hungary into ten circles, and ordered that all public business should be carried on in German. So far as Hungary went, his efforts have, in the long run, proved unsuccessful. At the date of his centenary Hungary is independent, controls all its own territory, and not only is Hungarian the only language recognized officially, but the Hungarians now treat German as the Germans in JOSEPH'S day used to treat Hungarian; and the German theatres in Hungary have lately been closed, lest the delicate ears of Magyars should be exposed to alien and obnoxious sounds. But in Austria Proper the battle of the languages is still being waged; and Austria forces German on the Bohemians as JOSEPH forced it on the Hungarians. The same people in Austria who really and sincerely support the reforms which JOSEPH foreshadowed in his rude and grotesque way are also the ardent supporters of this Germanization of the non-German provinces. They support it partly, perhaps, from the love of domineering which is inherent in human nature, but also because they honestly believe that Germany and everything German are the sole and the indispensable elements of civilization. By civilization they mean, practically, the spirit to imbibe and the will to adopt the reforms with which JOSEPH was in some imperfect way connected. They are thus, consciously or unconsciously, his disciples not only in that which is to be taught, but in the choice of the instruments by which it is to be taught. Whether they are right or wrong need not be discussed; but at any rate, as they are, in however indirect a manner, his disciples, it is not surprising that they should have taken the trouble to commemorate their master's reign by the modest tribute of a centenary festival.

DULCIGNO.

DERVISH PASHA has done good service to his sovereign by placing Dulcigno in the hands of the Montenegrins. It is uncertain whether the termination of a troublesome and tedious business was principally owing to the energy of the Turkish commander, or to the tardy acquiescence of the SULTAN in the conclusion that further delay would be detrimental to his interest. It is evident that RIZA PASHA might have occupied the place and handed it over several weeks ago; but perhaps he was expressly forbidden to use force, and it was not to be expected that the Albanians would submit to verbal orders. They have some reason to complain of the vacillation which tempted them ultimately to resist the occupation with considerable loss to themselves. The Turkish troops also have had to suffer for the uncertainty which was produced by long hesitation and delay. As soon as DERVISH PASHA had taken possession of the town, he was naturally anxious to hand it over to its new owners; and fortunately the Montenegrin general was authorized to accept the transfer at once. The Turkish Government is not bound to guarantee to Montenegro the peaceable possession of Dulcigno, but it is highly improbable that the Albanians should make any serious effort to resume possession. The Montenegrins conquered Dulcigno during the war; and they only evacuated it in deference to the decision of the Congress of Berlin. It has since appeared that there were strong objections to the cession by Turkey of other districts which were substituted for Dulcigno; and the Turks themselves consented to the restoration of the place. It is possible that, in declining for a long time to perform his promise, the SULTAN may have been influenced by the repugnance of the neighbouring Albanian tribes to the rule of hostile foreigners; but there is reason to believe that he stimulated the resistance which he has at last thought fit to suppress. The Prince of MONTENEGRO has shown much good sense in abstaining from any attempt to obtain the cession of the territory by force. When the Great Powers undertook to coerce the SULTAN, it was not the business of a petty potentate to anticipate the performance of that self-imposed task. It may be hoped that a minor danger to the general peace has been finally removed.

It has never been disputed that the English Government obtained a preliminary success when it induced the other Powers to concur in the naval demonstration. Mr. GLADSTONE proved the truth of his repeated assertion that the concert of Europe was possible, and it remained for him to sustain the additional proposition that it was also irresistible. It was hardly necessary for Lord GRANVILLE to contradict the statement that he had undertaken not to fire a single gun. A late French Minister, probably through imperfect acquaintance with the English language, had misinterpreted the declaration that the measure would probably effect its purpose so as to render the firing of a single gun unnecessary. Lord GRANVILLE had indeed recommended the more active operation of placing a flotilla of gunboats on some internal waters; but the Austrians objected that the gunboats might perhaps be left aground if the season proved to be dry. The fleet, or at least the English contingent, would have used its guns if they could have been of any service to the Montenegrins in a possible conflict with Albanians or Turks; but, as it was not intended to land any troops, the practicability of naval co-operation would have been more than doubtful. The moral influence of the combination was likely to be greater than its material result. The junction of the squadrons was a more authentic and more forcible substitute for the joint and several remonstrances which the Ambassadors had repeatedly preferred at Constantinople. On the other hand, there was some inconvenience in the possible contingency of the SULTAN'S declining to yield. For some time it seemed probable that the ships would have to leave the Albanian coast without having attained the object of the demonstration. It is impossible to say whether, during the long course of the negotiations, the SULTAN intended ultimately to yield. According to one conjectural theory, he cared comparatively little for the surrender of Dulcigno, but he wished, in anticipation of the controversy on the Greek frontier, to impress on the Powers a conviction of the difficulty of enforcing concession. The elaborate Note which purported to exhaust all the matters in dispute amounted to a defiance of the European concert; yet immediately afterwards the SULTAN promised, as the result has shown in good faith, to perform his engagements with respect to Dulcigno.

The causes of the sudden change are not positively known. Lord GRANVILLE attributes the success of the negotiation to the proposal of his Government that the combined fleet should execute or support a distraint on the Customs revenues of Smyrna. The process would, as he said, have been simple and effective; and it would have had the great advantage of requiring only the employment of a naval force. It is difficult to understand the additional statement that it would not have interfered either with foreign or with Turkish trade. The Porte would have refused to recognize the receipts for dues which might have been given by the officers of the fleet or by the agents of the allied Governments; and traders would have been compelled to pay a second time at some inland station appointed for the purpose. As no declara-

tion of war was to be made, the proceeding would have been abnormal, if not unprecedented; but it would have exhibited the boasted concert of Europe even more distinctly than the demonstration in the Adriatic. If Lord GRANVILLE has been accurately reported, the mere suggestion of the scheme prevailed over the obstinacy of the Turkish Government, which must therefore have taken alarm at an imaginary concert of Europe. It seems more probable that, even if the SULTAN had in the first instance been frightened by Mr. GLADSTONE and Lord GRANVILLE, he would have retreated to his original position when he ascertained that Smyrna was safe from foreign interference. The English Government prudently determined not to act alone or in concert with only one or two of the Powers. Austria kindly recommended certain methods of making the seizure of the revenues more stringent, but at the same time wholly declined to take part in the execution. France declared that the refusal of Austria altered the circumstances of the case so fundamentally that French co-operation must also be withheld. Germany followed the example of France; and therefore there only remained England, Russia, and Italy. Lord GRANVILLE's admirable illustration of concerted movements applies with remarkable force to the whole transaction. When in his youth he joined the Staffordshire Yeomanry he was told that he must not charge at a pace too fast for the heaviest farmer or the slowest horse. At Smyrna he could not move at all, because three of the rank and file out of six stood stock still when the charge was sounded. As the refusal of Austria and the rest must have been immediately known to the Porte, it seems to follow that the cession of Dulcigno was not caused by the Smyrna proposal.

Lord GRANVILLE took no notice of another explanation of the pliancy of the Turkish Government which has been positively given and generally believed. There must be some foundation for the statement that the German and Austrian Ambassadors impressed on the SULTAN the expediency or necessity of satisfying the demand of the united Powers. They are supposed at the same time to have given assurances that compliance in the matter of Dulcigno would be rewarded by the withdrawal of Germany and Austria from any further share in the naval demonstration. The same Powers, supported, according to general rumour, by France, have since strongly urged the Greek Government to suspend its warlike preparations; and they have intimated that, if Greece precipitates a conflict, it will stand alone. It was, if plausible report may be trusted, in consequence of the representations of the Ambassadors that the SULTAN prematurely announced the impending surrender of Dulcigno in a telegraphic message which was read at the LORD MAYOR's dinner. Immediately afterwards DERVISH PASHA was appointed to the command of the neighbouring district, with, as the result has shown, positive instructions to occupy Dulcigno and transfer it to Montenegro. It is of course possible that the six Powers may once more unite for the purpose of enforcing the decrees of the Berlin Conference. Even if this agreement is at present improbable, Lord GRANVILLE may be well advised in expressing sanguine views. There is no doubt that the Great Powers suffer a certain humiliation as long as they are unable or unwilling to enforce their own award; but for the present they are not prepared to agree on active measures. Holding a more responsible position than Mr. CHAMBERLAIN, and having also much experience of foreign affairs, Lord GRANVILLE abstained from offering the Greeks compliments on their national bravery; and he took care not to intimate, like his colleague, that, if the Greeks went to war, they would not stand alone. In defending the Cabinet from the charge of reticence, Lord GRANVILLE disclaimed a quality which in his position resembles a virtue. It is a much more serious fault to be too communicative; and Lord GRANVILLE was well advised in saying nothing of the intentions of the Government with respect to Greece.

JUDICIAL REFORMS.

THE Council of Judges has decided by a large majority to recommend that the divisions of the Common Law Bench of the Supreme Court shall be abolished, and that there shall be no more Chief Barons or Chief Justices of the Common Pleas. Lord COLERIDGE has been made Lord Chief Justice of England, and is, we presume, to be the President of the Supreme Court. No one can doubt that a Supreme Court must have a President, and Lord Chief Justice of England is not in itself a bad name for such a President, and has the advantage of keeping up an historical association. This could not be said of the offices of Chief Baron and Chief Justice of the Common Pleas. There are no Barons to have a Chief; there is no Court of Common Pleas to have a Chief Justice. The things having perished, the names necessarily perish with them. One of the ordinary judges of the Chancery Division is still called Master of the Rolls, and it may be reasonably thought unnecessary that the title should disappear. The Master of the Rolls is Master of the Rolls. In addition to holding the office of a judge, he holds the office of Keeper of Records, and the name describes a fact. It is true that he also has certain advantages over an ordinary judge. He receives a larger salary, he escapes going circuit, and he takes his place when wanted in the Court of Appeal. In like manner the Admiralty Judge and the President of the Divorce and Probate Courts, while they have advantage in point of salary over their colleagues, and do not sit as Judges of Appeal, have the privilege of not going circuit. If in the division of the work of the Common Law Bench it was found possible to give particular judges more honourable or pleasant work, such as that of always sitting in London, and of filling up places in the Court of Appeal when temporary assistance was wanted, there would be nothing inconsistent with the general scheme of judicature in giving such men an extra 1,000*l.* a year and investing them with a dignified title descriptive of their peculiar functions. But to call them Chief Baron or Chief Justice of the Common Pleas would be absurd. It would be a mere piece of wanton misdescription. On the other hand, the abolition of the names when the offices are gone has not only the merit of being in accordance with the facts, but it draws attention to the reason why the offices have come to an end. Divisions of the Common Law Bench have been suppressed for two reasons. In the first place, they impede the working of the machinery of justice. To have, so far as possible, a judge ready to do what is wanted at the moment is the aim, hitherto most imperfectly attained, of the new system; and the judges, to use intelligible language, cannot be so readily and quickly shuffled and bustled about if they are under the orders, not only of the President, but of divisional chiefs. In the next place, these divisions tend to introduce an intermediate tribunal foreign to the general scheme between the Judge of First Instance and the Court of Appeal. There is one spoke too many in the wheel. It is, perhaps, desirable that some questions should be heard before two judges. But nothing is easier than for the President to tell off two judges to deal specially with such cases, just as two judges on the Election Rota are told off to try a petition. The tendency of the divisions was to tell off two or more judges, not only when they were wanted, but when they were not. This led to a waste of judicial strength, and our present judicial strength is so limited that we cannot afford to have an atom of it wasted.

The possibility of doing away with these two great historical offices by one sweeping blow is due to a curious combination of circumstances. Death happened to create, almost at the same time, two vacancies in the three chiefships, and the survivor was of all men the most fit to be promoted to that chiefship which has always ranked as the highest. And it also happened that the Attorney-General of the day, who has a traditional claim to promotion to a chiefship, did not wish to change his position at the Bar, and in the House, for a seat on the Bench. There was, therefore, such an easy opportunity of suppressing the two chiefships as might not occur again for a quarter of a century, and the Government and the Council of Judges have hastened to take advantage of it. The only objection that has been raised to the change—and it is an objection very well worth considering — is that the Government, by sacrificing two well-paid and honourable places, will have fewer attractions to offer to those whom it may think it desirable to appoint as judges. It is said, and truly said, to be a very bad thing to make the best and ablest lawyers think a judgeship something that it is not worth their while to accept. But there are many things to be said about this. It must not be forgotten how very largely the number of high judicial posts have increased in late years. The Government has double, if not treble, the number of places above the rank of Puisne Judgeships to give away which were at its command a few years ago. There are the paid Life Peers in

the House of Lords. There are the paid members of the Judicial Committee of the Privy Council. There are six Lords Justices. If it is said that, in some of these cases, the pay is not in proportion to the dignity, there is an obvious remedy, and that is to raise the pay. The Exchequer will save a little by the abolition of the two chiefships, and it could not apply the money it gains better than by raising the inadequate salaries of the Lords Justices. There are no signs that competent men will not take judgeships. No member of the Bar can go back in memory to the time when it was not currently said as an obvious truth of some men that they would not take Puisne Judgeships. There have even been some men, like Lord CAIRNS and Lord SELBORNE, to whose pretensions it was generally felt from the outset that anything below the Chancellorship would be inadequate. There are others, again, like Lord Justice COTTON, who it is recognized cannot take anything under a Lord Justiceship. But in every generation there will be men who could, if they wanted, get something higher, but who do not like to refuse a Puisne Judgeship when it is offered them. They are determined by various influences—by considerations of health, by the consciousness of aptitude for judicial work, and very often by the wish to please their families. There are of course exceptions, for there will always be some leading barristers who have a great Parliamentary position, or are within the range of the very highest promotions; but in a general way it is found that there are very few leaders, however much money they may be making, who would not take a Puisne Judgeship at forty-five or a Lord Justiceship at fifty. No one who knows the Bar can seriously say that, if an ordinary judgeship or a Lord Justiceship fell vacant, there would not be found three men at least perfectly competent, according to the respective standards, to hold the post, or that if the post was offered to all three in turn, they would all refuse it. Occasionally, too, it happens—and the contingency must be taken into account—that there are men who are not leaders of the Bar in the sense that they make a large professional income, and who are calculated to make excellent judges; and when these men are added to the leaders who would not really refuse a judgeship, it seems very improbable that the Government will ever be crippled in its choice of judges.

But, although the abolition of the two chiefships is not at all likely to stop the flow of competent judges, it must be admitted that it will accelerate a change that has gradually been going on for some time. The Attorney-General, if he is a strong man, has been gaining, and will now gain, more evidently and fully a new position. Whatever might be his titular rank, he has always stood above the Puisne Judges, and he now stands above the Lords Justices. But he did not stand above the Chief Baron or the Chief Justice of the Common Pleas, for they were the holders of the offices at which he was, if a common lawyer, supposed to be aiming, and for a great number of years the Law Officers have been common lawyers. As there are now fewer officials on the Bench who are above him in position, the position of the Attorney-General is magnified. As he is less of a judicial expectant, he is more of a political leader. It so happens that at the same time the Chancellor has become less of a judge and more of a political officer. The Chancellor now scarcely ever sits as a judge except in the House of Lords, and his principal duty is to act as the supreme legal adviser of the Government. We have thus got an irregular and informal Ministry of Justice, composed of the Chancellor and the Attorney-General, with the Solicitor-General as a sort of Parliamentary Under-Secretary. These Ministers may be expected to share the fate of other Ministers. They will go in and out with their party, and when they are out will try to come in again. In every Ministry there are Ministers who must be in the Lords or who must be in the Commons. The Lord Privy Seal must be a peer, and the Chancellor of the Exchequer must be in the Commons. In the same way, one of the heads of the legal department of the Government must be, as Chancellor, in the one House, and the other, as Attorney-General, must be in the other House. They will thus be in the position of other Ministers, with one advantageous exception. When they are out of office the Chancellor will have his reduced salary and the Attorney-General will have his private practice. Looked at in this light, the Attorney-General is a Minister among Ministers; and, if he is not of the highest rank in the list, has the compensating privilege of making much more money. While, therefore, the abolition of the chiefships will not check the flow of judicial promotion, it will undoubtedly check the flow of promotion to the Attorney-Generalship. This flow will be checked just as it may be said that the flow of promotion to any high office of State is checked when such a man as Lord GRANVILLE is made Foreign Secretary. So long as his party are in, and he is not Prime Minister, Lord GRANVILLE must have the seals of the Foreign Office. As long as the Liberals are in and he can keep his seat, Sir HENRY JAMES must be Attorney-General. Whether the Bar will consider that they lose or gain by all this may be uncertain. Fewer men can hope to become Attorney-Generals; but then there will be a great political office which must be held by a leading barrister, and those who are not Attorney-Generals may console themselves, if they please, with the reflected lustre they will thus enjoy.

OBSTRUCTION AND PARLIAMENTARY PARTIES.

MR. RAIKES, who speaks with authority on questions of Parliamentary procedure, controverts in the *Nineteenth Century* the proposals made by Lord SHERBROOKE in a former number of the same periodical. Both writers regard with equal indignation and repugnance the modern practice of obstruction; but Lord SHERBROOKE weakened his protest by diverging from his censure of the real offenders to the earlier and wholly dissimilar practice of his Conservative adversaries. There is a wide difference between pertinacious, or even factious, opposition to a particular measure and deliberate attempts to prevent general debate and legislation. Both modes of procedure are objectionable; but they require wholly dissimilar remedies. Lord SHERBROOKE, after assailing some of the opponents of the last Liberal Ministry, thought fit to make the paradoxical suggestion that Lord BEACONSFIELD's colleagues connived at obstruction because they were themselves disposed to do nothing. There are nevertheless some compensating advantages in an honestly irritable temper. Having indulged his spleen against a section of the Conservative party, Lord SHERBROOKE admitted that the conduct of the late Opposition in dealing with the Mutiny Bill of 1879 was not less vexatious. He might have added that the same politicians afterwards transferred their energies from the House of Commons to the constituencies. Among the arguments addressed to an enlightened populace not the least successful were embodied in placards and pictures, describing the tortures which the inhuman Tories were supposed to inflict on the unhappy soldier. Lord SHERBROOKE unwillingly arrived at the conclusion that it might become necessary to resort to the French method of *clôture*, or summary termination of the debate. Some part of his argument was founded on assumptions which, if not exaggerated, are not likely to be generally admitted. Every speaker is, according to Lord SHERBROOKE, "*in posse*, if not *in esse*, the enemy of the trans-" action of business"; yet Parliament surely derives much of its purpose, as it takes its name, from the obnoxious process of speaking. Several years ago Mr. LOWE, then Chancellor of the Exchequer, with characteristic indifference to the susceptibilities of his audience, informed the great body of private members that their motions and debates were altogether useless, and that the only business which deserved attention was that which was managed by the Government. It was impossible to express the truth in a more unpalatable form. Since that time Lord SHERBROOKE's proposals for preventing obstruction are likely to be regarded with jealous suspicion.

Mr. RAIKES strongly objects to the introduction of the *clôture*, amongst other reasons because the power might be abused by an intolerant majority. The party which is at present dominant has on many occasions shown a disposition to disparage the supremacy of Parliament. It is supposed to be the chief duty of the Liberal party to obey its leader, not by reason of its own confidence in his discretion, but because he is a popular favourite. As the power of terminating a debate would necessarily be exercised by the majority, it is possible that it might be unjustly used to the detriment of the present Opposition. Mr. RAIKES prefers a modification of the standing order which was passed shortly before the dissolution. The initiative, according to the present rule, belongs to the Speaker or the Chairman of Committees, who, in Mr. RAIKES's judgment, ought not to be exposed to collision with disturbers of order. He accord-

ingly suggests that the presiding officer should only act at the instance of any two members who might invoke his authority. Mr. RAIKES also recommends a curtailment of the license of multiplying speeches in Committee, while he would not alter the rules of debate in the House. There is too much reason to fear that, in diminishing opportunities of obstruction, the House of Commons would still leave open too many points of attack. Even if a single member can be silenced, his accomplices can always come to the rescue by repeating his offence. It is still doubtful how far the House will be able to suppress disorders which until two or three years ago had never been contemplated as possible. Every association of men depends on the agreement of its members to pursue their common object in good faith. According to an instructive though doubtful legend, even the *liberum veto* of the anarchic Polish Diet was sometimes rendered harmless by the simple process of knocking the objector on the head. Mr. GLADSTONE's motion that a perverse orator should not be heard involved, among other difficulties, the objection that any other member was entitled to speak on the question.

The opinions both of Lord SHERBROOKE and of Mr. RAIKES will receive the attention which is due to Parliamentary and official experience; but the House of Commons, and especially the Opposition, will require in the approaching Session all its patriotism, its prudence, and its self-command. Above all things it is necessary that the wilful disturbers should not be kept in countenance by the example of any other section of the House. The indiscipline of a few members of one of the regular parties might furnish an excuse for disloyal eccentricities. On two occasions within living memory a defeated party has been restored to popularity and power by steady and concerted action. In both cases success was obtained by systematic obedience to a chosen leader. Sir ROBERT PEEL and Mr. DISRAELI had scarcely a quality in common, except resolution, definite purpose, and the faculty of commanding obedience; but neither had, in the process of rebuilding a party, reason to fear mutineers or rivals. The present Opposition, if it has no DISRAELI at its head, may nevertheless profit by the prudence, the moderation, and the popularity of its actual leader. Sir STAFFORD NORTHCOTE will not be in a hurry to condemn by anticipation the Irish policy of the Government, though it may in the end probably not receive his approval. He and his party will unanimously desire the re-establishment in Ireland of the social security and freedom which have been scandalously sacrificed by the Government; but the Irish populace ought not to have an excuse for believing that coercion is a Tory measure. Those who are officially responsible for the restoration of order ought to encounter any odium which may follow from the discharge of their duty.

The measures which will be proposed as remedial ought also to be awaited in patience, and to be dispassionately considered. It is nearly certain that they will involve violations of the strict rights of property, especially as some members of the Cabinet have long cultivated a prejudice against landowners. English proprietors, not only of land, but of other kinds of wealth, have much reason to fear the establishment of a precedent which will hereafter be cited against them; but, if Irish owners think it expedient to sacrifice a portion of their interests to preserve the remainder, their opinions will be entitled to considerable weight. Some of them would naturally welcome any measure which might enable them to dispose of their land, although they might know too much of Ireland and of agriculture to believe that the purchase of proprietary rights would tend to diminish rural poverty. It will scarcely be proposed that the taxpayers of the United Kingdom should bear the cost of a doubtful experiment. On the other hand, the Irish peasantry would probably repudiate on the first occasion a debt which they might have incurred in the acquisition of the fee simple of their lands. In all these matters the members of the Opposition may properly exercise the function of criticism; but it may be assumed that the economists of the Liberal party must sooner or later resist the schemes of demagogues, and they will vindicate their principles the more effectually because they will not be exposed to the imputation of party motives. At the beginning of the Session there will perhaps be little occasion for Conservative activity. It is now known that some kind of Coercion Bill will be proposed by the Government, and Mr. PARNELL has already announced his intention of meeting any attempt of the kind by systematic obstruction. It will be the business of the Ministers, and especially of Mr. GLADSTONE, to devise and execute methods by which the independence and efficiency of the House of Commons may be asserted. They ought not to have the excuse of impediments placed in their way by the legitimate Opposition, or even of officious interference which might furnish an excuse for slackness and timidity.

THE FRENCH GOVERNMENT AND THE COMMUNISTS.

THERE is very little probability, whatever there may be of truth, in the statement in yesterday's *Standard* that France and Germany have come to a mutual understanding to "crush Communistic aspirations." A better means could hardly be found of making these aspirations formidable. To associate the Commune with the national antagonism to Germany has always been the aim of its defenders, and they would have some colour for their contention if they could point to an arrangement with Germany to suppress a movement which is at all events essentially domestic. Nor, unless the relations of the French Government to the Extreme Left or of the Extreme Left to the Communists undergo a very speedy change, is there much chance that a Ministry which made such an engagement would be left in office to carry it out. So far as can be guessed from the straws which float about on the surface of Paris politics, the Communists are again on the road to becoming a power. They are exceedingly audacious, and where the friends of order are frightened, as they are in France, audacity counts for something. They command or influence a considerable number of votes, and when the ordinary method of showing disapproval of an agitation is to abstain from voting, even a few votes may do a good deal. The scheme of a petition to the municipality of Paris to fix a place in which a monument may be set up to the Republicans illegally slaughtered in 1871 may prove nothing more than the impudence of its authors; but it is never safe to say what impudence may not do in Paris, and even the proposal of such a petition shows how largely the fear of being identified with the Commune has died out. According to some accounts one object of the Bill which the Government has brought in for the redistribution of Paris into five vast districts, each returning from ten to twenty representatives, is the effacement of the Communist element from the Municipal Council. In each of these large districts men of all opinions will be mixed together, and the moderate Republicans will then vindicate their superiority alike over reactionaries and extreme Radicals. It will not be surprising if the real effect of this measure should be the exact opposite of that expected from it. That the reactionaries will lose the few seats they now hold in the Municipal Council is likely enough; but, as regards the Communists, it may turn out that the moderate Republican element in a Paris constituency, like the same element in the Chamber of Deputies and elsewhere, will be completely controlled by the extreme element. A moderate party cannot live on its name alone. It must have a policy and an organization, and the moderate Republicans in France have neither. In every critical division the Left Centre, which may be taken as the typically moderate group, goes half with the Government and half against it—half, that is to say, supporting the Government because it is Republican, and half opposing the Government because it is Radical. This is not a state of things which promises many electioneering successes.

The recent trial of the libellers of General DE CISSEY was made the occasion of rival manifestations on the part of the Communists and the anti-Communists. The attacks upon the GENERAL had at all events so much foundation as was supplied by the very compromising letters which he had written on behalf of Mme. JUNG. But the GENERAL might have done much more than this, and no one would have troubled their heads about it, if he had not also put down the Commune in a very merciless way. It was the commander who had cleared the streets and houses of Communists, not the Minister suspected of having made an improper use of his official influence, who was the real object of attack. His counsel was not slow to see and take advantage of this. He defended General DE CISSEY against certain specific charges brought against him, but he reserved all his eloquence for an outburst against the Commune. The

effect of this passage made it clear that, if the party of order is weak in resolution, it is not weak in lung. The greater part of the audience—especially of the professional audience—shrieked applause at M. ROBINET DE CLÉRY's speech, and could only be checked by a suspension of the sitting. The incidents which accompanied the suppression of the Commune are not of a kind to be looked back to with much satisfaction when once the passions that provoked them have died out, and when it appears that they can still be referred to as constituting a soldier's best claim to the admiration of good citizens, it is safe to infer that these passions have not died out. The men who cheered M. ROBINET DE CLÉRY would probably not scruple to have recourse a second time to General DE CISSEY's method, if they had but the army at their command. Outbursts of this kind help to keep up an uneasy feeling in Paris, and go to rehabilitate the Communists in their own estimation. It is a very great change from the state in which the amnesty found them to that in which they now are—from being the objects of a pity which tried to appear contemptuous to being the objects of ill-disguised alarm. It is impossible not to feel some doubt as to what would be the action of the Government if the mob which escorted M. ROCHEFORT home after his condemnation by the Correctional Tribunal should take it into its head to present a petition to the Chamber with a similar display of external support. They would do their best, no doubt, to dissuade the presentation of a petition in this fashion, but whether they would have the courage to forbid the electors free access to their representatives is less certain. Some of the deputies who voted for the return of the Chamber to Paris may not now feel quite so easy as to the wisdom of their vote. The force of the argument that, if the Government is not able to control Paris, it is not fit to have the conduct of affairs, is not diminished, but the evidence that it is able to control Paris is not growing stronger.

It is possible, no doubt, that when M. GAMBETTA himself takes office or becomes President a new vigour may be found to animate the Government. He is, at all events, a man of resolution, and the possession of apparent as well as real power may bring these qualities to the front. If he is re-elected for Belleville next year, he will have avoided an open quarrel with the party which originally sent him to the Chamber, and has up till now kept him there, and he will in all probability have a choice of safer seats open to him. Unwillingness to kick down the ladder before you are safe at the top is no evidence of unwillingness to kick it down when the top has been reached, and though M. GAMBETTA is a long way up, he probably does not feel that he can yet afford to throw over the party by whose help he has risen. When he needs their help no longer, he may pursue a bolder policy. It is strange that the chances of the moderate Republic should seem to depend upon the degree of favour with which M. GAMBETTA is likely to regard it hereafter. But, unless the next election should disclose a greatly changed state of feeling in France, this is very little more than the truth. There are several politicians of more or less mark, but one and all seem wanting in that individual force which qualifies a man to be a leader. M. DE FREYCINET has shown that he can stick to his opinions, and suffer for them; but there are no signs that a FREYCINET party is growing up in France. M. JULES SIMON is an excellent speaker and occasionally succeeds in defeating the Government by means of a coalition with the Right in the Senate; but M. JULES SIMON counts for very little in the country and a party which accepted his leadership would by that very fact shut itself out indefinitely from office. The Left Centre contains some politicians of considerable repute, but they are like the dry bones waiting for a wind to revive them. The Right Centre has so compromised itself by its association with reactionary intrigues that men like the Duke DE BROGLIE and M. BUFFET have scarcely more concern with practical politics than the Count DE CHAMBORD himself. It is a great piece of good fortune for the Republic, that the moment when all sections of its supporters, except the most extreme, seem struck with political paralysis, should also be the moment when a new schism has disclosed itself in the Bonapartist party. If there were any real agreement among the Imperialists, they might find much to rejoice at in the present state of affairs. At bottom France is neither Radical nor Royalist, but it is her misfortune that her only choice seems to lie in being either one or the other. The politicians who set themselves to oppose Radicalism are all suspected of Royalist leanings. The politicians who undertake the defence and guidance of the Republic seem unable to conceive a Republic which is not Radical. The Bonapartists, under a competent leader, might steer a middle course between these extremes; but, though the competent leader is forthcoming, the Bonapartists refuse to be led by him. The group which goes by the name of the Appeal to the People is breaking up under the dissolving influence of Prince NAPOLEON's presence in the front of the party. With all his undoubted ability and force of character, he has not succeeded in reconciling the two elements which make up modern Bonapartism. Though he is anti-clerical possibly rather by antecedents than by conviction, he is still anti-clerical; and the section of the Imperialists which regards M. DE CASSAGNAC as its apostle is shocked at the mere suspicion of impiety. Apart from his antecedents, Prince NAPOLEON might have got over their dislike; but a leader who was one of the guests at the too-famous Good Friday dinner is expected to manifest contrition for the past, as well as to promise amendment for the future.

RECIPROCITY.

WHEN people are in distress it is useless to expect them to be reasonable, and it is well to bear this in mind when dealing with the irrepressible appeal for Reciprocity. The demand is sometimes treated as though it were merely the gratuitous expression of a perverse economical heresy. What it might be under happier circumstances it is of course impossible to say. There are such things as theoretical bimetallists, and in the face of that wonderful fact it would be rash to set any limits to human originality. But the appeal for reciprocity, as it is actually met with, is more commonplace and more melancholy. It comes from men who are hit hard by foreign tariffs, and who use their natural liberty of crying out when they are hurt. Perhaps some of our best political economists might not be superior to the same temptation if their income was derived from sugar or iron. Unhappily, though the complaint is perfectly natural, there is very little hope that it will make the case of those who utter it any better. In point of fact, so far as it has any effect at all, it has a direct tendency to make their case worse. The more lamentations are heard from this country on the subject of protective tariffs, the more joy there will be in the countries which impose them. Even the foreign consumer, who can ordinarily derive but a vicarious pleasure from a process which makes everything he buys dearer, may feel a patriotic glow when he reads of the pain he is helping to inflict upon England. He is a long-suffering person, this foreign consumer, and, with this drop of economical cold water vouchsafed to him, he may hold out for years. If he could be convinced that the protective tariff which he bears so uncomplainingly did foreign nations no harm, he might be led to ask himself whether his love for this or that industry was really strong enough to make even high prices sweet to him. While he is able to think that the additional profits secured by the tariff to the favoured trader come in part out of English pockets, he is far more likely to forget that the lion's share comes out of his own. When Sir STAFFORD NORTHCOTE warns English miners not to take up an attitude which would give foreigners the impression that they have got the best of the bargain now, and that the ruined and despairing Englishmen are trying to turn the scale against them, he suggests a very useful caution. There is an indisputable danger in the assumption of such an attitude, and an equally indisputable tendency on the part of some Englishmen to assume it.

It might be of some use in convincing suffering traders in this country that no remedy is to be found in the direction in which they are anxious to persuade the Government to look for it, if they would draw out a detailed statement of the duties they would like to see imposed, and of the effect which they think would follow upon their imposition. They would then see that the necessary result of the policy they wish to see adopted would be to deprive them of the one counterbalancing benefit which they at present enjoy. When, for example, a miners' representative suggests that the true way to get foreign countries to take off the duties levied upon British goods is to impose corresponding duties upon foreign goods, he can

hardly have considered how such a scheme would work out. It would plainly be useless to impose reciprocal duties upon the precise articles on which they are levied in other countries. The complaint of the English trader is that he is shut out from foreign markets, not that he has a rival in his own; and he would not be in the least helped by a tariff which made his command of his own market more undisputed. It is undisputed enough already, or he would not be so anxious to send his goods abroad. He wants to send them out of the country because he has more than is wanted to supply the demand in the country. In this respect the cry for reciprocity generally differs from the special cry for reciprocal duty on goods the import of which into England is stimulated by foreign bounties. There are other objections to this latter demand, but it is not open to the precise objection which has just been stated. If reciprocal duties are to help the English trader, they must be placed upon some things which foreign countries export largely to Great Britain. If they are placed upon goods which foreign countries do not largely import to Great Britain, those countries will not feel their imposition. A duty which hurts nobody abroad is a duty which, even on the retaliatory theory, can benefit nobody here. The first step, therefore, in the direction of reciprocity must be to fix upon articles which are imported into this country in sufficiently large quantities to make any considerable diminution in their supply a matter of real concern to the exporting country. No doubt it would be easy to find such articles. Corn would answer to the description in America; wine, if the phylloxera leaves any, would answer to it in France. Let it be supposed that the hard condition of the iron miners has moved Parliament to compassion, that a war of tariffs has begun, and that a heavy duty has been levied upon American corn and upon French wines; what will be the benefit to the English miner? He will admit, of course, that, in the first instance, and as regards his particular grievance, it will be none at all. A duty on American corn and on French wines will leave the sale of English iron in French or American markets precisely what it was. The miner will reply that these retaliatory duties are only meant to help him indirectly. He wants to make it the interest of the Americans and the French to take off the duty they now levy on English iron, and in order to bring this about he makes it their interest to get the English to take off the duty they levy by way of retaliation upon American corn and French wine. But what if the Americans and the French take a similar course, and at once look about for additional articles upon which they can levy duties with a view of punishing England for imposing duties on their staple produce? Such a method of action would be very much more consonant with the ordinary tendencies of human nature. The interests injured by the new English policy would be exceedingly indignant at what we were doing, and yet, on the theory of reciprocity, they would be sufficiently calm and reasonable to see that the real sinners were not the English who taxed their corn or their wine, but their own miners who had previously taxed English iron. To expect this is to suppose that all concerned in these great industries are at once sound economists and unimpassioned philosophers—sound economists inasmuch as they see at once where the fault lies, unimpassioned philosophers inasmuch as they are not prevented from acting on what they see by any irritation against the immediate cause of their sufferings. That, at some stage or other of a war of tariffs, either or both combatants might find out their error by experience is highly probable. But it would be exceedingly rash to say at what stage this discovery would be made, or even that it might not be delayed until both nations were hopelessly ruined. In the meantime the position of the English miner would be doubly altered for the worse. His already limited market would be still further narrowed. He now sells some iron to his own countrymen; but with the price of corn and wine raised by the retaliatory duties there would be less money left to spend on other things, and things made of iron would not be exempt from this general law. Side by side with this further diminution of profits there would be the need of paying more for the corn and the wine he used himself, and though under a system of reciprocal duties he would have very little to spare for the latter, he would hardly be able to reduce his expenditure upon bread. Nor would he be the only sufferer. The English consumer would in effect be taxed to improve the prospects of the miner. Everybody eats bread, and a good many of us drink wine, and neither process could go on under a system of retaliatory duties except at greatly increased cost. If the prospects of the miner were really improved by the sacrifice, it is conceivable that he might think it good discipline for the consumer; but there would be no comfort in injuring his fellow-countrymen while gaining nothing for himself in return.

If the advocates of reciprocal duties had the courage of their opinions, there is a plan that they might urge which would not injure the consumer any more while it would be a real advantage to the producers in whose behalf the imposition of these duties is demanded. It has been shown that a duty on corn and wine would not induce the Americans or the French to take off the duty on iron, and so would not directly benefit the English miner; that it would increase the price of corn and wine, and so injure him alike directly and indirectly; and that it would at the same time directly injure the English consumer. If, instead of this, an additional Income-tax were levied and paid over to the miners, they would benefit by the full amount of the sacrifice made by the consumers, while the consumers themselves would suffer no more than they would under a system of reciprocity. The only objection that can be urged against this proposal from the miners' point of view is that it would make the real incidence of the subsidy voted to the miners disagreeably apparent. But it is no real argument against a financial scheme that it shows facts as they are. If the English consumer is to be taxed for the benefit of the English producer, he had much better be taxed *eo nomine.*

THE POLICE AND THE PUBLIC.

THERE are two sets of persons with whom no reasonable critic ever wants to finds fault—the police and the magistrates. Both have very difficult duties to perform, and if both do not perform them ideally well, the police usually perform them a good deal better, and the magistrates a very great deal better, than might have been expected. The two are, moreover, something of a check upon each other—at least the magistrates are certainly a check on the police—and, on the whole, there is not much to complain of in the manner in which order is preserved in a city where, considering its population and the character of that population, order is by no means easy to preserve. During this week, however, two cases have occurred at different police courts, the decisions in which are by no means easy to reconcile. Both of them bear witness to a temper on the part of the police which we should be very sorry to see on the increase. But, on the other hand, the model policeman, who may be supposed to spend his time in studying the decisions of magistrates for his guidance and improvement whenever he is not drilling, or writing reports, or conducting malefactors to durance, or discharging the other duties of his responsible office, must be a good deal puzzled by these two decisions. It would appear from them that excess of duty in Lambeth is model conduct in Southwark; and that the lieges of Bermondsey had better beware of looking over the least little wall, while those of Walworth may steal horses with impunity. This certainly should not be, and the two cases deserve a little attention.

On the 13th of last October certain men of Walworth seem to have felt the necessity of hearing and echoing the chimes at midnight. No evidence is produced to show that they were actually disorderly, but they presented a rollicking and festive appearance, which revolted the orderly soul of Police-constable COLLARD. COLLARD accordingly went up to them, and made the usual remark that they were to move on, to which it was replied, also as usual, but apparently with more than usual truth, that they were doing no harm. Thereupon, COLLARD acted up to his name with respect to one of them, a scuffle took place, both men fell, and the police-constable fractured his ankle-bone. The culprit came before the magistrate on Wednesday, the constable not having been able to give evidence before. On the face of it, to disable a constable in the execution of his duty is a very serious offence. But unluckily there

was no evidence at all to show that the constable was engaged in the execution of his duty, and there was some evidence to show that he was engaged in overstepping it, and in interfering unnecessarily with peaceable citizens, Mr. Saunders seems to have been quite right in discharging the prisoner, and in cautioning the officer to let his mishap be a warning to him in future. But, if the Lambeth magistrate was justified in thus acting, there certainly was something odd about the proceedings of his brother of Southwark earlier in the week. A shopkeeper of Bermondsey was summoned for being drunk and disorderly, and for breaking through the ranks of the police while proceeding to their beats. Now it may be that some people have noticed the manner of the police in proceeding to their beats, and have observed a certain tendency to keep "eyes right" in a severely military manner, and to preserve the uniformity of the line at the cost of pushing the profane vulgar into the gutter. Such things have certainly been seen, and CHRISTOPHER WOOD, the Bermondsey culprit, alleges that something of the kind happened to him on this occasion. According to WOOD's story, he had his back turned to the advancing file of police, and, turning round sharply, came into collision with one of them, by whom, in spite of his apology, he was so roughly pushed back that he fell through a shop window. The police, it is to be observed, drew a distinction about this part of the matter which would do honour to Mr. GLADSTONE. WOOD, they said, was not pushed into the window, but he "fell through when the constable put him "on one side." This extraordinary conduct on his part was, according to a very general theory of the Force, set down to intoxication, and WOOD was arraigned on the double charge of drunkenness and breaking through the ranks of the police. The charge of drunkenness was amply refuted, and the magistrate made the curious remark that he believed the case would never have come before him if the defendant had not (after being upset through the window) gone up to the sergeant of police to take his number. "Many constables," said Mr. BRIDGE, "took offence because people asked for their number. "It was a very foolish thing." We should have hoped that Mr. BRIDGE meant that it was a very foolish thing for the constables to take offence; and then, though we might have thought the adjective hardly strong enough, there would have been no particular necessity to comment on the remark. But the magistrate's decision seems to indicate that, in his opinion, the folly rested with the troublesome public. For, though he dismissed the summons on the plea that WOOD was not drunk, he expressly said that "he had no reason to complain "of the police." Now if, the charge of drunkenness being put aside, Mr. BRIDGE has no reason to complain of the police, it must be because he thinks it quite a natural thing for a policeman to send any one who casually touches him spinning into a shop-window, and to charge him with being drunk and disorderly because he has the insolence to ask for the officer's number.

It is perfectly right that, when there is a doubt about the matter, magistrates should support the police, because, if the police are not supported, their authority, especially in the rougher parts of the town, would be very much weakened. We could even understand—though we should not wholly have approved the decision—that in the Walworth case Mr. SAUNDERS, looking to the serious injury inflicted on the policeman, and to the fact that this injury could not have been inflicted without a rather obstinate resistance on the part of the captured person, might have thought it right to caution this latter that it would be better in such a case to submit quietly and seek ordinary legal remedy. Discipline must be maintained, as great authorities have it. But, if Mr. SAUNDERS seems to have gone a very little bit out of his way to maintain the liberty of the subject, Mr. BRIDGE seems to have fetched an altogether enormous compass for the purpose of curtailing it. For it is obvious that in WOOD's case the failure of the charge of drunkenness made the whole charge against him collapse. A drunken man might possibly have been imprudent enough to add insult to injury by first interfering with the admirable order of the police and then asking their numbers; a sober one, having fallen foul of them, would have taken pretty good care not to expose himself to their clutches. Besides, the police explanation of the falling through the window depended on the supposition of WOOD's drunkenness. This being the case, we should have thought that a sharp reprimand to the sergeant, and a hint that the preservation of a correct line in marching is altogether a less important matter than the preservation of a correct demeanour towards "civilians" (as police slang has it), were the least that could have been given. We should have thought, too, that such a thing as an objection on the part of constables to have their number taken deserved the very severest words that a magistrate can with propriety employ. A more preposterous notion we have seldom heard of. And if it be that any such objection exists, Sir EDMUND HENDERSON had better put it out of the heads of his men by a general order, or whatever may be the term employed, as soon as possible. There are several alterations, no doubt, that might be made with advantage in the police arrangements of this capital. But there is one alteration which we certainly do not want. We do not want a policeman to fancy himself (and still less do we want to have the fancy sanctioned by magisterial authority) an infallible being any insult or injury to whom, whether he be in the right or in the wrong, is *ipso facto* an insult and an injury to the majesty of the law, to be visited with condign punishment. That is the theory of several Continental countries, notably of two which do not otherwise often agree, of France and of Germany. In either country the hair of all magistrates, judges, and public prosecutors would stand on end with one consent at the idea of such an outrage as the fracture of a policeman's ankle being passed over, not merely without punishment, but with a reprimand, or something like it, to the officer. But the theory of England and of Englishmen is very different. When a policeman is acting within his duty all sensible people among us agree that hardly any punishment can be too severe for molestation or resistance offered to him. But the moment he outsteps his duty he not only loses this right to additional protection, but becomes more guilty than an ordinary person, inasmuch as his responsibility is greater, and the danger of an abuse of his power greater likewise. This wholesome doctrine Mr. SAUNDERS seems to have fully recognized; Mr. BRIDGE seems to have ignored it in a manner which we shall mildly call surprising.

INSURANCE AND THE EMPLOYERS' LIABILITY ACT.

WHEN the Employers' Liability Act was under discussion, no point in connexion with it was more stoutly debated than the relative merits of insurance against accident and compensation for accident. Strictly speaking, the two methods could not be weighed against one another. The ideas on which they severally rest are distinct, and even opposite. The one aims at minimizing the mischief done by an accident which has already happened, the other at minimizing the chances of an accident's happening. The one is a matter of prudence on the side of the workmen who are liable to injury, and of benevolence on the part of the employer in whose service the injury may be inflicted. The other is a question of law—of what, that is to say, the law ought to enact in the absence of any special contract overriding it. As soon as this difference was clearly realized, it was evident that provisions about insurance could not properly be introduced into a Bill dealing with compensation. Nor was it possible to set up any general standard to which the contributions of employers must conform in order to exempt them from liability to make compensation. The amount contributed must vary according to a number of circumstances which might not be precisely alike in any two cases. What would be a handsome payment from one employer might be only a colourable payment from another. Yet, if anything had been said about insurance, some rate of contribution must have been prescribed, by conforming to which employers might escape the operation of the Act. The effect of this would have been that some would have been let off too easily, while others would have been made to pay too much. In the first case, workmen would have been made to contract themselves out of the Act at the sacrifice of a material part of the benefits which the Act was designed to give them. In the other case, employers would have been precluded from contracting themselves out of the Act except at an unnecessarily high cost.

Although, however, the two ideas have really nothing in common, it is quite possible that, in particular cases,

one may be substituted for the other, to the very great advantage of both parties. An instance in point is the proposal lately made to their servants by the London and Brighton Railway Company. This Company, it seems, has always been a liberal contributor to the fund by which the men in its employ have insured themselves against accident; and, by means of this additional payment, the servants of the Company have received, for premiums of 6*d.*, 4½*d.*, or 3*d.* a week respectively, according to their position in the service, payments of 100*l.*, 75*l.*, or 50*l.* in the event of death by accident, together with 20*s.*, 15*s.* or 10*s.* a week for twenty-five weeks in the event of injury. It is now proposed to double the payments received by the men without making any change in the payments made by them. A first-class servant subscribing 6*d.* a week to the fund will receive, as now, 20*s.* a week in the event of his being injured; but he will receive it for fifty weeks instead of for twenty-five. In the event of his being killed, his representatives will receive 200*l.* instead of 100*l.* A second-class man will receive 150*l.* instead of 75*l.*, and a third-class man 100*l.* instead of 50*l.*, each also receiving the same allowance as now in case of injury, but for fifty weeks instead of for twenty-five. The Company have left it to their servants to determine whether they will accept these new conditions of insurance or take their chance under the Act. Apparently the men will have no difficulty in coming to a decision, since the maximum compensation recoverable under the Act would, taking the average wages of the staff, be not more than 180*l.* This sum, moreover, would only be payable when the accident had been traced to the negligence of the Company or of those to whom it had delegated authority, whereas under the insurance scheme the compensation will be payable in all cases of death, whether caused by the fault of the Company or not. The advantage to the Company from the proposed arrangement lies in the maintenance of friendly relations with their servants. If they do not contract themselves out of the Act there can hardly fail to be a considerable number of lawsuits arising out of the new liability of employers. This does not mean that the men would put forward claims which they knew to be unreasonable, or that the Company would resist claims which they know to be reasonable. But there would naturally and almost necessarily be a certain number of accidents as to which it would be a very doubtful question whether they were or were not fairly traceable to the negligence of the Company's responsible agents. The men could not afford to withdraw every claim which the Company resisted; the Company could not afford to acknowledge every claim which the men put forward; and the only way out of the difficulty would be to go to law. Unfortunately, whatever is lost or gained by the parties to a lawsuit, there is one thing which is invariably lost, and that is temper. It is certain that before a dozen claims for compensation had been refused and taken into court a great deal of ill-feeling would have grown up between the Company and its servants. Some claim would have been put forward or contested on imperfect knowledge; and then, when the facts came out, what was really due to ignorance in the first instance, and to obstinacy afterwards, would have been set down to malice. All this will be avoided by the expedient proposed by the London and Brighton Railway Company. The men will get as much as the law would give them, and get it with more certainty, and without the risk of having to fight for it. The Company will pay at least as much as the law could make them pay, but they will be saved the expense of litigation and the many ill consequences of discontent among their servants.

The action of this Company is of itself an answer to those who argued last Session that the Employers' Liability Bill, if passed, would be of no advantage to the workman. It has doubled the benefits which he enjoys in the service of a particular employer, and, if it has this effect in the case of an employer who dealt with him liberally before the Act was passed, it is fair to assume that it would have that effect still more markedly in the case of an employer who was disposed to do the least he could. The Company have shown their appreciation of the force of the new Act by the sacrifice they have made to contract themselves out of it. Their servants would be exceedingly ill-advised if they declined the offer, because it is in all respects a liberal one. But there will be a very large number of employers who will not offer anything like such good terms, and then their workmen would be equally ill-advised if they accepted them. Liberality of this kind finds its reward in the command of the best men in the particular market from which labour is drawn. Prudent and hardworking men will find an inducement to go into the service of the London and Brighton Company in the fact that they will enjoy benefits which elsewhere they could only enjoy with the not improbable drawback of having to fight for them. Of course less far-sighted employers will not be equally alive to the advantage of a liberal insurance. But the working of the Act will tend by degrees to convince them of it. A man who sees that his neighbour contributes as much to his men's insurance fund as the law could make him pay if he contributed nothing may be inclined at first to save his money now on the chance that he may not have to spend it by and by. But by degrees, as he sees that this neighbour gets the best workmen, never has any disputes with them, and has no such item as defence of compensation suits in his solicitor's bill, he will come—if he is not proof against teaching—to take a different view of his interest. The change which the Employers' Liability Act has made in the workman's position is simply this—it has enabled him to hold out for an effectual provision in the way of insurance, in the knowledge that if no arrangement is made the law will see that he is not a loser. It may be objected that, in some cases, workmen will practically be compelled to accept a quite inadequate contribution to their insurance fund as consideration for contracting themselves out of the Act. That is to say, in certain trades, or in certain conditions of trade, workmen may be too weak to make good terms for themselves. That, no doubt, is true; but against such a state of things as this no statute can be a complete protection. If it were made illegal for workmen to contract themselves out of the Act, some mode of evading the law would be discovered, supposing that master and men were alike anxious to find it. If no such other mode could be discovered, the cost of compensation would somehow be deducted from wages, and though the workman might be richer by the law in the event of his being killed or disabled, he would be poorer by the law so long as he remained uninjured in life and limb. A statute which makes it the interest of masters to deal handsomely by their men in the article of insurance, and gives the men the right in the absence of insurance to enforce compensation, except in cases where they are accidentally too weak to hold their own, seems to be as good a settlement of the question as it is possible to arrive at.

UNDERGRADUATE POETRY.

THE Universities have always been the home of young poets. If a man does not write verses between the ages of eighteen and twenty-two, it is probable that he will for ever abstain from song. Everything encourages poetry at Oxford and Cambridge. The scenery, the historical associations, the visits of young ladies at Commemoration, the prize founded by Sir Roger Newdigate, the passions and the inexperience of youth—all combine to make men versify. Thus Pembroke was "a nest of singing-birds" in Dr. Johnson's time, and thus Creech found about thirty brethren in Apollo to whom he could dedicate each of his translations of the Idyls of Theocritus. Men who do not usually show much academical ambition compete for the Newdigate at Oxford and the English verse prize at Cambridge; and a terrible time the examiners have, with the copy of hundreds—literally hundreds—of amateur bards. Some men write, to be sure, in a cynical spirit, like the author of a well-known fragment on Nebuchadnezzar. The poet remarks that the monarch was "turned out to grass,"

> And murmured, as he scan'd the unwonted food,
> It may be wholesome, but it is not good.

A composition on Venice may be discarded after the author is found to aver that

> Passengers for Venice get out here,

which is all very well in Baedeker, but unsuited to the dignity of song. An Ode on Paris under the Commune thus described the condition of the city:—

> There's many a corpse across the threshold laid,
> That, yesterday, with smiling children played.

In the same unsuccessful essay a hero of the Commune was observed

> To scowl defiance at the hissing balls—

a very bold figure. Yet authors afterwards distinguished have gained prize poems, as Mr. Tennyson, Mr. Matthew Arnold, Dean Stanley, and a singer who does the verses for the Christmas cards.

Next to the examiners for the Newdigate, the editors of magazines suffer most from undergraduate poets. No man knows on what principle magazine editors select their verses. It is almost impossible to suppose that the majority of the countless effusions they receive are not better than the rubbish they print. Probably they prefer to insert the lays of their nieces, and their cousins, and their aunts; at all events, they very rarely accept the ditties of the undergraduate. The consequence is that the Universities maintain little miscellanies of verse of their own, to which only the academic songster may contribute. We have two of these tiny volumes before us—*Mensae Secundae* and *Waifs and Strays* (Simpkin, Marshall, and Co.) *Mensae Secundae* were, originally chanted, it seems, in the groves of Balliol; but *Waifs and Strays* is a little magazine open to all the University. There is something remarkable in the appearance of these volumes. In old times, ten years ago, Oxford had a small yellow periodical, named *College Rhymes*, which appeared to be entirely supported by the subscriptions of contributors to its pages. *College Rhymes* was a commonplace-looking magazine, with an ugly but unpretending yellow cover. Undergraduate taste has advanced with the age, and *Mensae Secundae*, like Mr. Whistler's pamphlet about Mr. Ruskin, is bound in coarse brown paper. *Waifs and Strays* has an elegant wrapper of *papier vergé*, and no immortal work ever had rougher edges. It may be worth while to examine the verses in both collections, for great poets, before now, have written undergraduate rhymes. Mr. Tennyson had not left college, it is said, before he had composed *Ulysses*, and spoken, to Mr. Thackeray's surprise, of "the great Achilles whom we knew." And even in the earliest verses published in *Poems, chiefly Lyrical* (1830), there may easily be heard the unmistakable accent of an original poet. There is a "chorus," written long before 1830, in which there are lines about the mountains riven

> By secret fire and midnight storms
> *That wander round their windy cones*—

in which it is impossible not to recognize the peculiar music of Mr. Tennyson. Many of Keats's best poems, too, were written before he was of an age to put on the bachelor's gown, and there are other encouraging examples. Is there any trace of originality in the verse of this generation of undergraduates, and, when they are not original, who are the poets that they imitate?

We cannot pretend to have discovered any new voice among these beginners. Neither Balliol nor the University at large contributes anything but echoes. Some of the echoes, however, are pretty enough. In *Mensae Secundae* there is a sentimental poem on Nausicaa's emotions after she has seen the last of Odysseus. Granting that it is fair to make Nausicaa seem a love-lorn modern maiden, which we doubt, these verses, in a metre improved by Mr. Swinburne from the translation of Omar Khaiyyam, are sufficiently pleasing. Here are the latest words of Nausicaa, who longs for rest in Hades, among the renowned queens of ancient days:—

> Why should I live where everything goes wrong,
> Where hope is dead and only grief lasts long!
> I will have rest among the asphodel;
> For death is stronger, though my love be strong.
>
> There will I see the women he did see,
> Leda and Tyro and Antiope
> And Ariadne, queens that loved too well
> Of old, and ask them if they loved like me.
>
> The last white stars grow fainter one by one;
> The folding mists rise up to meet the sun;
> Birds twitter on our dewy orchard trees;
> Day comes: alas, my day is nearly done.
>
> (He is on land in Ithaca by this.)
> Come now, I pray thee, and with one soft kiss
> Draw the life out of me and give me ease,
> Queen golden-shafted, maiden Artemis.

Here is considerable command over a by no means easy metre, and the language is picturesque, if not in a very original manner. But the next piece, "Tricolor," is a laughably successful imitation of an affected style played out long ago. We must quote "Tricolor," as it is probably the last waif thrown up by the receding tide of a futile mannerism:—

> Blue her kirtle was, I ween
> (*doce amie*),
> Red and white her face was seen:
> White as lily in a mere
> (*flors de lis*)
> Floating on the wan water,
> Red as apples in a croft
> (*el tans d'esté*)
> Which her maiden plucketh oft;
> Blue her eyes as blue steel bright;
> (*les eus vairets*)
> They have made my red heart white.

In a later poem, "Qvinetiam Nox Venit," Love, of course with a large L, asks riddles which we cannot pretend to answer:—

> Child, are the lilies whiter than the rose?

and so forth. A piece styled "Tyrus" is an accurate imitation of a certain production of Mr. Swinburne's. No doubt unconsciously, the author of the following lines has burlesqued Mrs. Browning's "Great God Pan":—

> For the great god Pan had look'd with a frown
> On the reeds that laugh'd as he sat by the mere,
> They laugh'd, "he is mad to sit low down
> In the evening here."

"Great Pan is dead," as we know, and possibly he died of the cold he caught when he was so mad as to sit low down in a damp spot after sunset. The great god Pan should have been more careful. The poem ends by assuring us that, though "the lake is dry" (having probably been drained by the enterprise of modern Greece), "the reeds stand now where the reeds then stood." This looks as if the draining had been scamped, like that of Cowley Marsh, where the reeds have, or had lately, a tendency to grow on the Balliol cricket-ground. A very sad poem follows, in the metre of *In Memoriam*, almost the only trace, if it be a trace, of the influence of Mr. Tennyson. Mr. Rossetti and Mr. Swinburne seem to have it all their own way at Balliol. "Strange smiles," especially in Lionardo's pictures, are dear to the young men who cry

> O virginal soft mouth of girl or boy!

as if Lionardo had not succeeded in making it manifest whether he meant to draw a man or a woman. Here we certainly are very remote from the influence of the Laureate, but that of Maudle and Postlethwaite is manifest enough. The last thing worth notice in the volume is a very clever sonnet on Botticelli's picture of Venus rising from the sea. There may be some sweet enthusiasts who will scarcely recognize Botticelli in the "Alexander Filipepius" of the title of the sonnet.

Waifs and Strays are scarcely so characteristic of the present taste as *Mensae Secundae*. The poet who makes "roses" rhyme to "garden closes" and "colder than the snow's is," has been reading Mr. Swinburne. We quote "Love Unreturned," both because of its cleverness and of its debts to Mr. Rossetti:—

> My soul, where is the fruit of thy long pain
> To render to the husbandmen above?
> Thou hast been watered by my tears of love
> For that pure spirit whose serene disdain
> Pierced like a ploughshare thro' thee, leaving plain
> Forgotten depths wind-sown, whereout I strove
> Unceasingly to gather what might prove,
> In time of harvest, tares instead of grain.
>
> "Alas," my soul said, "had but Love passed by
> And cast into the furrows, as he went
> Sowing beside all waters, in the spring;
> Methinks I had borne fruit abundantly
> For God to garner, as He sits intent
> Above the angels at their winnowing."

The last line contains an image that might naturally occur to an early Italian painter, but not to a modern undergraduate. The "Sea Maiden" is a very near relation of Mr. Arnold's "Forsaken Merman":—

> Where her deathless days are led,
> Sitting she combs her golden head,
> Under the noisy querulous
> Waste waters of the wan sea's house.
> Often she goes at dead midnight
> Far up the shimmering starlight,

and so forth. In "Last May-day" there is a queer chryselephantine blossom,

> O gold and ivory flower of perfect face!

Also here are alliterations about meadows

> Made multitudinous with marsh-marigold;

which is a funny line in all conscience. Though there are good lines even in this poem, and though *Waifs and Strays* contains a pretty musical madrigal "Amoret," we fear the critic must cry, with one of the poets of the collection, "Unreal! unreal!" The translator of an epigram of Theocritus has been very successful, save for one unlucky line; but the verses of most of his companions are indeed unreal. They are echoes of voices which we scarcely thought had still the strength to produce an echo. The future of English poetry would be blank if imitations like these were all that the youngest versifiers have to offer. Here there is scarcely any emotion displayed but that of a voluptuous melancholy; here there are scarcely any traces of thought, and the writers are content to reply faintly to the faint and mournful music of older men. An excuse for imitation is given in the motto from the "Poetics" prefixed to *Mensae Secundae*:—τὸ γὰρ μιμεῖσθαι σύμφυτον τοῖς ἀνθρώποις ἐκ παίδων ἐστίν. But, as youth is almost always imitative, we wish the Oxford poets would now and then choose manlier models and express moods more buoyant and joyous.

THE ASCENT OF CHIMBORAZO.

An account by Mr. Whymper of his first exploration in the Andes, and of the ascent of Chimborazo, gives unusual interest to the number of the *Alpine Journal* which has just appeared. The account is, it is true, of the briefest, consisting merely of the rough notes made by him while travelling and climbing; but some idea may be gained from it of the difficulties which had to be encountered, and probably not a few readers who have been wearied by the terrible prolixity of most Alpine stories will be little inclined to complain of a narrative which is marked by the opposite fault. It appears from his curt statement that Mr. Whymper left England in the beginning of November last year, and gained his first experience of the pleasures of travel in semi-civilized countries by being detained nine days at Colon in consequence of the Panama Railway having been partially obliterated by heavy rains. From Colon he went to Panama and Guayaquil, and thence up the river Guayas to a place bearing the name of Bodegas, so pleasantly suggestive of sound

sherry. Not far from the village thus agreeably designated the ascent of the outer chain of the Andes begins, and during two days the traveller advanced up the slopes of this range, which he crossed at the height of 10,365 feet. A considerable descent and a short ascent took him to Guaranda, which stands at an elevation of 8,870 feet. At this place his operations against Chimborazo began, and his first proceeding will certainly seem strange to those who are accustomed to read of ascents and descents made in sixteen or seventeen hours. To use his own words, he "hired a house and decided to make this a base for attack on Chimborazo." It gives one a vivid idea alike of the difficulties of the undertaking, and of the resolute spirit in which Mr. Whymper set to work, to find that he took a mansion as preliminary to attempting the ascent of a great peak. Subsequently he learnt to make short work of the high summits of the Andes; but at first he seems to have shown the greatest deliberation, and to have advanced on his mountain as an engineer might explore a country. Small, indeed, was the chance of Chimborazo when such a master in the art of mountaineering as Mr. Whymper set to work in this fashion. On the day after he had acquired the residence which has been mentioned, Mr. Whymper ascended to the highest part of the "Arenal," a sandy plain lying south of Chimborazo, and, after attaining an elevation of 14,000 feet, returned to Guaranda. Strange to say, during the return he suffered greatly from the rarity of the air, and it seems, could hardly walk. Having thus inspected part of the route himself, he next sent the two Piedmontese guides he had brought with him to look at it; and, after being away two days, they came back much fatigued, and said that they had selected a camping place at a height of over sixteen thousand feet, but that getting there would be very hard work. There had certainly now been inspection enough, and all was ready for a start; but a delay was caused by Christmas Day, which seems to be as great an affliction in Ecuador as it is in England. On December 26th, however, Mr. Whymper got off, and, preliminary trials being over, began the ascent of the mountain.

His party was a large one. He had brought with him, as has just been said, two Piedmontese guides. These were Louis Carrel and the well-known J. A. Carrel, a very admirable mountaineer. He was also accompanied by a Mr. Perring, who acted as interpreter, and by three arrieros or couriers, and two Indians, and the baggage was carried by no less than fourteen mules. Most unpleasant for a time were the incidents of travel. On the first day the party encamped on the highest part of the Arenal, and in the morning it was found that the two Indians and five mules had disappeared during the night. When the second camp—*i.e.* the one selected by the Carrels—was reached, both those guides and Mr. Whymper suffered from extreme exhaustion, and for a whole day they were scarcely able to move. After this the Piedmontese got a little better and were sent off to explore, but they foolishly made a push for the summit, which was as unsuccessful as it deserved to be, and came back utterly exhausted, and with eyes so badly inflamed that another idle day had to be passed. Their failure to get near the summit apparently convinced Mr. Whymper that his camp was not high enough, and as soon as the Carrels had recovered, another was selected at a height of 17,400 feet. No less than three days were occupied in getting this ready, but the time cannot have seemed long, as there was pleasing relief to the monotony of labour. Mr. Whymper learnt that some of the boxes left at the resting-place on the Arenal had been broken open and rifled; and after the excitement caused by this news had subsided, three Indians, who were sent up from Guaranda to replace those who had deserted, duly deserted in their turn when carrying wood for firing. Wood must have been much wanted by the travellers, as on New Year's Day a bitter wind caused them great inconvenience. On the succeeding day the third camp was at last ready, and there Mr. Whymper and his guides passed the night, prepared to grapple with the final difficulties of the mountain. On January 3 they started, but were driven back by a bitter wind. Nothing daunted, next day they went forth again, this time to victory, and, with better weather, they made at first, not indeed rapid, but fair progress, ascending 2,600 feet in a little more than five hours. How they accomplished the remainder of the ascent had better be told in Mr. Whymper's own words. He says:—

At 11 A.M. we were nearly 20,000 feet high, and up to that time had experienced fine weather, with a good deal of sunshine. The sky now became clouded all over, the wind rose, and we entered upon a large tract of exceedingly soft snow, which could not be traversed in the ordinary way, and it was found necessary to flog every yard of it down and then to crawl over it on all fours. The ascent of the last 1,000 feet occupied more than five hours, and it was 5 P.M. before we reached the summit of the higher of the two domes of Chimborazo (21,424 feet). On the immediate summit the snow was not so extremely soft, and it was possible to stand up upon it. The wind, however, was furious, and the temperature fell to 21° Fahr. We remained only long enough to read the barometers, and left at 5.20 P.M.; by great exertions succeeding in crossing the most difficult rocks, which had to be passed over just as the last gleam of daylight disappeared; but we were then benighted, and took more than two hours in descending the last 1,000 feet—arriving at the camp about 9 P.M.

The ascent had occupied altogether nine days, Mr. Whymper having left Guaranda on December 26 and arrived at the summit on January 4. He was not, however, in the very least tired of his mountain, and, considering apparently his exposed camp at a height of 17,400 feet to be just the place for literary composition, he occupied himself during January 5 in writing letters and notes. Next day very bad weather gave him a mild hint to retreat, and he descended to the second camp; but he had not done with Chimborazo by any means. On January 7 he went up to the highest resting-place with the Carrels, and quietly proposed to them to "explore for another ascent." They declined, and, it must be said, had good cause for so doing. Louis Carrel's feet were badly frostbitten, and, "in the course of discussion," says Mr. Whymper gravely, "it came out that this was one reason for declining to make another ascent." How many other reasons Carrel may have given does not appear; but it certainly seems to us that their enumeration must have been rather superfluous, and that the worthy guide resembled that famous governor who, after stating that there was no powder, desired to set forth the other causes which prevented him from firing a salute. Satisfied no doubt to the full extent of all logical requirements, Mr. Whymper descended to the second camp, where he spent three days. On the second Mr. Perring, who had apparently been sent for the mules, arrived in charge of them, and, after loading them with the baggage, he and the Carrels descended with them to a place bearing the charming name of Chuquipoquio. Mr. Whymper remained alone to make observations, and two days passed before he at last tore himself away from Chimborazo and went down to the village just mentioned. He found Louis Carrel suffering greatly, and it was necessary to remove him to a town named Ambato, where some kind of medical aid could be obtained. "More than three weeks elapsed, says Mr. Whymper, "before he was able to walk, and more than five weeks before he made another ascent. We thus lost an entire month in the finest part of our season." With this statement his narrative closes for the present.

The ascent which Mr. Whymper has recorded is certainly in some respects more remarkable than any mountain climb which has yet been described, and in his brief story facts of peculiar interest are mentioned. What will probably first strike the reader is the extraordinary time occupied in making the expedition. As has been shown, it was not until the ninth day after quitting Guaranda that Mr. Whymper stood on the summit of Chimborazo. With most travellers such slow work might be attributed to indolence and dawdling, but in Mr. Whymper's case the supposition is not permissible. His indefatigable energy is well known, and, indeed, his soberly written notes give ample evidence of it. It may perhaps be thought that he had too many followers on the mountain-side, and that he had an unnecessary amount of stores; but the fact of his having been thus encumbered does not alone account for the slowness of the ascent. Probably this was in great part due to the rarity of the air, which enervated the whole party from the beginning, and it is difficult to avoid the conclusion that the effect of the rarity of the air was increased by peculiar atmospheric conditions. It will have been observed that when he first explored the route between Guaranda and the Arenal Mr. Whymper suffered greatly. To use his own words, he was, whilst going back, "severely affected by diminished barometric pressure, and had to be supported for a large part of the way." Now the greatest height attained on this occasion was 14,000 feet, and for so practised a mountaineer this was nothing. The Breithorn is only some three hundred feet short of this elevation, and the ascent of the Breithorn is, we believe, looked upon by members of the Alpine Club as an agreeable promenade. Scores of times must Mr. Whymper have been at a height of 14,000 feet in the Alps, and yet, when he attained it in the Andes, it utterly prostrated him. What happened afterwards was equally remarkable. Mr. Whymper and his guides rode up the whole way to the second camp, and yet, when they got there, they were completely exhausted, and next day they lay "panting in the tent." They were, it is true, at a considerable elevation, being about 800 feet higher than the summit of Mont Blanc; but when the ease with which practised men walk up Mont Blanc is remembered, it is difficult to understand why Mr. Whymper, a man thoroughly accustomed to mountains, and the two Carrels, men belonging to an Alpine district, should after their ride on Chimborazo have been so prostrated. May there not be reasons for supposing that the rarity of the air is at times specially trying, owing to causes not at present known? Of course the density at the same heights must always be the same, but other conditions may vary, and, in some manner not yet understood, affect respiration. Cases which support this view are not wanting; but we will content ourselves with citing one. Some years ago, in a balloon ascent from Paris, death was caused by the rarity of the air, although the elevation attained was far below that which had previously been reached. In Mr. Whymper's case, the exhaustion produced by the thin air, first felt at a moderate altitude, was probably, as has been suggested, the main cause of the long time occupied in making the ascent. His narrative shows, however, as has been shown before, that a rarefied atmosphere produces little effect on certain peculiar constitutions, and his letter to the *Times*, written some time after the date of the notes now published, showed how soon men can get accustomed to it. Perring the interpreter, who ascended to the third camp on Chimborazo, seems to have been little affected, and in no very long space of time Mr. Whymper and his guides became so acclimatized as to be quite comfortable at a height of 20,000 ft. or thereabouts. How he attained that delightful result, and how he climbed the many peaks which, after his very deliberate work on Chimborazo, he "polished off" with such astonishing

lity, has yet to be told. His notes leave him with a disabled side at Ampato. The remainder of them, describing the wonderful series of ascents which he made in the Andes, will be looked for with no common interest.

THE RELATIONS OF THE HOUSES OF PARLIAMENT.

UNDER the above title, Mr. W. St. John Brodrick, M.P., has contributed to the *Fortnightly Review* for December an article which deserves the attention of all thoughtful and moderate politicians. The intemperate folly with which a large number of persons of very different degrees of importance, from Mr. Forster to Mr. Boyd Kinnear, have spoken of the House of Lords in the last few months, and the attempts which have been made to saddle upon that House the responsibility of those Irish troubles which the Compensation for Disturbance Bill would, if passed, certainly have intensified, will have done some good if it leads men of sense to consider the relations in which the two Houses stand, not so much to each other as to the nation and to the business of the nation. It is notorious enough that at the present time the public business has pretty well got the better of the persons and institutions who are charged with it. The characteristics of those institutions are sufficiently different. For the moment, we need not insist on the distinction which Lord Salisbury has recently drawn between the House of Commons as the representative of the passing, and the House of Lords as the representative of the permanent, sense of the nation. This, whether well founded or ill founded (and much history, at least, is in its favour), only goes to the respective value of their decisions on points of actual politics. It is needless to say that the vast majority of the matters brought before both Houses of Parliament are not—certainly they ought not to be—matters of politics, at least of party politics, at all. They may be, and too frequently are, made such by the competition of different parties for the favour of the public; but, intrinsically, they are pure matters of business. Such as they are, they are submitted to two assemblies, one of which is essentially political, the other essentially businesslike. But, as a matter of fact, the mass of the duty is assigned to the political assembly, and the smallest part of it, with the smallest allowance of time to do it in, to the businesslike.

It may scandalize some people that we should have adopted such a distinction as this; but it would be difficult to find many persons of sense who in private would gainsay it. Mr. Brodrick has given some figures to prove that the majority of the members of the House of Lords are not even the dumb dogs which Radical opinion assumes them to be. But it is hardly necessary to enter into this part of the question. It is plain on the face of it that the House of Commons is the very worst place in the world for the preliminary shaping and fashioning of complicated measures involving much business detail. Mr. Brodrick's sketch of the ordinary fate of such a measure is not in the least exaggerated. It is brought in, and, being fought as a party question, is carried on the second reading by a party majority. Very likely the discussion of many of its vital points is postponed for Committee, and, as a matter of certainty, a mass of heterogeneous amendments, involving all sorts of particular interests, is introduced. Fresh fights take place, really on the principle of the Bill which is supposed to be settled. Amendments, practical and appropriate enough, get no real hearing; and very likely their movers, disgusted at this, revenge themselves by mere obstruction. If such a Bill were introduced in the first place in the House of Lords, experience shows that at least its technical defects would be removed, and the points vital or not vital to the measure distinguished with despatch and sureness. For, as has been said already, the Lords are nothing if not businesslike. Most of them have had a good deal of business experience in one way or another; they are not hampered by duties to constituents, or by deference to an imperious public opinion; and the placid atmosphere of their [illegible]

[illegible] my vote would make no difference," is only too exact and historical an account of the conduct of many a member of the Lower House. It is in the nature of things impossible as a description of the conduct of a member of the Upper. It is of course true that factious or frivolous members in the Lower House might still persist in proposing irrelevant amendments even to schemes which had already been most thoroughly licked into shape. But there is a great difference between such conduct and the adroit—sometimes perhaps the almost unintentional—seizing on weak points in the original scheme, which weak points the fighting of the second reading as a party battle in a party assemblage is sure to leave. Mr. Brodrick very pertinently selects as an instance of what he means, the unlucky Army Discipline Bill, which was one of the scandals of the last Parliament. It is true (which he does not mention) that in the temper in which Opposition critics then were, the Bill of Rights, and the original Mutiny Act, and Magna Charta, for aught we know, would almost certainly have been trotted out at the suggestion of submitting such a measure in the first place to the House of Lords. But it is equally certain that, had it been so submitted, it would have come down to the Commons in such a shape that an immense amount of time would have been spared, and, what is more, that the reputation of the Government for leadership, and of the Opposition leader for consistency, would have escaped considerable damage.

In the course of his argument Mr. Brodrick makes some statements which may well seem dubious. Thus he grants that "there has been a steady progress of late years in the diffusion of political knowledge." We doubt it very much. There has been a steady progress no doubt in the diffusion of talk about things political; but political knowledge, in any real and valuable sense of the word, seems to have been steadily disappearing. In particular, the objections constantly made to this plan of throwing more work on the House of Lords (for, of course, the proposal is a sufficiently old one) show a really marvellous absence of this same political knowledge. We are told that the most important Ministers sit in the House of Commons; that the House of Commons is the voice of the nation; that the pursestrings are in the hands of the House of Commons; and many other things having as much (and as little) to do with the question as these. That question is whether, having a vast superfluity of business to be done, and an excellent engine not at present half-worked to do the business, we choose to recognize the two facts or do not choose. Of course the real objection to the plan is a hidden one. The professed enemies of the principle of a Second Chamber, or of an hereditary Second Chamber, do not like to give the House of Lords an opportunity of proving its real value. It might be thought that against this not very creditable consideration they might set another which is obvious enough. The popular Chamber, being at present set to manage work too hard for it, incurs constant and, in a way, unmerited disgrace for the manner in which it does or does not do this work. It may be put to a reasonable Radical (if there is such a being) whether he does not think it likely that a repetition of the scenes of the present and the last Parliament may before long seriously injure the reputation of the House of Commons. One House struggling in vain to be allowed to be doing some business; another House putting its head down and forcing measures through by mere brute strength, irrespectively of argument, are not examples of the excellence of representative government convincing to the typical modern person who believes in the general openness of all questions. If such government enjoys a just prestige, it is simply because it has hitherto worked well; and if it works badly, its prestige may be lost. Divine right in the House of Commons is as awkward a thing to trust to as some other kinds of divine right.

No doubt considerable practical difficulties have hitherto been experienced in carrying out Mr. Brodrick's plan, and those difficulties have not been lessened by the nonsense talked about the action of the Lords in reference to the Disturbance Bill. A Government which does not want to conciliate the House of Lords, which indeed would rather not conciliate the House of Lords, which cares nothing for any but definitely party measures, and which feels confident in its strength to hustle through the Lower House those of such measures which it cares most about, and hopes to force the Upper House into passing them without discussion, is not likely to adopt such a plan if it can help it. On the other hand, cool-headed persons see that there would be considerable danger in the principle which Lord Redesdale rather rashly announced the other day—that of flinging measures neck and crop out of the House of Lords on the plea that there is no time to consider them. The plea was just, but not wise. Nor, in all probability, was Lord Beaconsfield well advised in his opposition—to which Mr. Brodrick refers—to the suggestion that the Lords should begin their work earlier in the day. The reason of that opposition very probably was a fear lest the Upper House, finding its time on its hands, should begin to indulge in the *ventosa et enormis loquacitas* which has long characterized the Lower. There are peers enough in the Government, if they chose to stand up for their order, to secure that at least a larger proportion of measures than at present should be initiated in the Lords. Next Session seems to be an unusually suitable opportunity for making a beginning. For it may be safely assumed that the promised, or almost promised, Land Bill will occupy the time of the House for the greater part of the period before Easter; and, unless Mr. Gladstone means habitually to sit into September, or to abandon all but blazing legislation altogether, he can hardly avoid, little as he may like it, giving the Lords something more like their fair share of early work. It is needless to say that, if this be done, a considerable responsibility will rest on the Upper House, and that the Peers will be, or ought to be, on their mettle to show that their business capacities have not been overrated by Mr. Brodrick and others of their eulogists. Their present champion protests against the supposition that he considers the House "an assembly of the most highly developed legislative capacity." It would certainly be a bold man who should advance any such claim either for Lords or Commons. All that is necessary is to show that the House of Lords probably contains as many men of average business capacity as any House of Commons—certainly contains as many, if not more, of average business experience—and from the nature of its composition is exempt from many of the difficulties and disqualifications of the sister institution. Now this, except by mere spouting demagogues or partisans smarting from a recent defeat, is undeniable. To say that there is not plenty of work suitable, in the first place, for submission to such an assembly, argues either a deplorable ignorance of the actual state of the national business, or a want of confidence equally, though in another sense, deplorable, in the powers of managing and arranging that business possessed by the nation's Government. Mr. Gladstone himself must see that, paradox as it seems at first sight, the best way to prevent the Lords from grumbling at having too much work thrown on them at the end of the Session is to pro-

vide them with plenty at the beginning. We have had as yet no intimation that the three thoughts have been thought, and the sternest of Radicals, if he be only honest, will admit that what you do not abolish you may just as well utilize.

JOSEPHISMUS.

OUR readers may perhaps be rather puzzled by the heading of this article, nor are we prepared to vouch for its Ciceronian correctness. But Josephism, like the cognate and still more cumbrous terms Febronianism and Hermesianism, which are indeed closely connected with it, has, we believe, found a place in recent Latin text-books of theology or canon law, as the description of a modern variety of heresy or something very like it. And there can be no doubt that Joseph II., whose centenary has just been celebrated at Vienna, has managed, justly or unjustly, to secure the permanent detestation of the great majority of the Roman Catholic world. The contenary, we may observe in passing, is dated, not from his formal accession to the Imperial throne, which occurred in 1765, but from the death of his mother Maria Theresa, the darling of the clergy, in 1780, for up to that time, under her imperious control, he "reigned but did not govern." The duration of his actual rule therefore was comprised in the ten years from 1780 to 1790—a short period for the vast designs he desired to accomplish. Mr. Bryce has not inaptly described him in his *Holy Roman Empire* as "a sort of philosopher king, than whom few have more narrowly missed greatness;" nor can the substantial accuracy be disputed of what has been called his aptest epitaph, "Here lies the man who, with the best intentions, never carried a single project into execution." With his general career, however, which was at best a splendid failure, we are not now concerned. His ecclesiastical policy, which proved also a failure, though hardly perhaps a splendid one, was one of the most marked and characteristic features of his brief but energetic government, and will afford abundant materials for our exclusive consideration in this place. It is "a far cry" from the Emperor Joseph to the Ferry Bill, but perhaps it may not be inopportune to observe that there is a certain analogy between the religious controversies in Austria which vexed the soul of Pius VI. a century ago and those which are agitating the French Church at this moment. In both cases alike the alleged assault on the liberties of the Church falls under the comprehensive designation of Erastianism, though much else also was involved in the abortive scheme of ecclesiastical reform projected by the Emperor Joseph. When he visited Rome—though he was not crowned there—he was greeted with cries which had not for three centuries been heard in the streets of the Papal metropolis, "Evviva il nostro Imperatore! Siete a casa vostra; siete il padrone." And it was significant that when the Pope undertook a journey to Vienna, in the vain hope of arresting the course of the Imperial reformer, the Minister Kaunitz, to whom his Holiness offered his hand to kiss, took it and shook it instead. Liberal as were his aims in one sense, and deeply coloured as was his mind with the teaching of the French Encyclopædists, it was still the ruling idea of Joseph, as Ranke points out, to unite all the powers of the monarchy, without check or limitation, in his own person, and therefore, *inter alia*, to suffer no religious authority over his subjects not subordinate to his own. Ranke thinks it doubtful whether he was more surrounded by infidels or by Jansenists, but adds that here, as in the attack on the Jesuits a few years earlier, they combined their forces for the common end of waging a destructive warfare against all institutions calculated to uphold the external unity of the Church. That was indeed the natural tendency of Joseph's ecclesiastical policy taken as a whole, but it may be doubted whether he was himself a conscious disbeliever in the doctrines of his Church or intended to precipitate a schism, though a not unreasonable apprehension of this result may have prompted the journey of Pius VI., the *peregrinus apostolicus* of St. Malachy's prophecy, to Vienna.

Joseph II., like other and greater potentates who have left their mark on the world's history, was yet after all the creature of his age. His religious theories were the product of the movement of thought in the eighteenth century, which under the diverse aspects of scepticism and Jansenism had exercised so considerable an influence in France and ultimately culminated in the French Revolution, itself the starting-point of the later "Catholic reaction," which was the breakwater of the advancing tide. These theories had already penetrated to Germany, and had found significant expression in the writings of John von Hontheim, Suffragan Bishop of Trèves, better known under his assumed name of Febronius, who in 1763 published a work against the lofty pretensions of Papal supremacy, which he treated as a creation of the Church rather than a divine prerogative. He also directly advocated the independent reform of national Churches, and the restriction of their intercourse with Rome. His book was of course condemned, but it produced a wide and lasting effect on the public opinion even of Catholic Germany. "Imbued," says an English Ultramontanist writer, after denouncing the principles of Febronius, "with the maxims of this insidious Jansenism, as well as with many of the false principles of Illuminism; vain, frivolous, and egotistical, yet not devoid of benevolent feelings, the perverted philanthropy of the Emperor Joseph was the curse of his subjects." He carried out the counsels of Febronius in making the royal *placet* a necessary condition of the reception of all Papal bulls, whether doctrinal or disciplinary, and transferring the right of dispensation in matrimonial causes from the Holy See to his own bishops. Of more than 2,000 monasteries he suppressed all but 700, including all the contemplative orders, male or female, and only allowing those societies of nuns to survive which could show themselves to be employed in works of active usefulness, while those which survived were cut off from all intercourse with their superiors at Rome; the very convent where he took solemn leave of the Pope was immediately afterwards suppressed. That, here at least, he was in fact "an unconscious instrument in the hands of a high retributive Justice for the chastisement of declining piety and zeal," is allowed by one of the most uncompromising of his assailants. He withdrew the training of clerical students from episcopal control, and abolished all religious confraternities and pilgrimages, and the bishops with difficulty dissuaded him from abolishing clerical celibacy. He even condescended to regulate the minutest details of liturgical worship—prescribing, *e.g.* how many candles should be lighted at mass—whence Frederick the Great used to call him "my brother the Sacristan." The influence of his Church policy was widely felt, both at the time and afterwards, as well in Germany as beyond its borders. The great ecclesiastical Electors, who had hitherto been closely united with Rome, began to revolt from her authority, and in a declaration signed at Ems in 1786 by the Electors of Cologne, Trèves, and Mayence and the Archbishop of Salzburg, the rights of the episcopate as against the Papacy were roundly asserted, in the matter of dispensations, appeals and the like, and the Pope was bidden to content himself for the future with the rights assigned to him in the early Church. A Roman prelate bitterly stigmatized this document as "written with a pen dipped in the gall of Paolo Sarpi." This declaration was no doubt afterwards formally retracted, but its principles continued to leaven the minds of the German bishops and clergy, and have now again borne fruit in the Old Catholic movement of our own day. Earlier in the present century there was an active and powerful party in the German Catholic Church who agitated for the abolition of enforced celibacy, a vernacular liturgy and other kindred measures, while Hermes, a professor in the Catholic Faculty at Bonn, propounded a philosophy which was condemned at Rome as subversive of all faith in divine revelation.

The influence of the Emperor Joseph's ecclesiastical reforms made itself more immediately felt at the time in Italy. At Naples the last traces of feudal subjection to Rome were abolished. In Tuscany the Grand Duke Leopold undertook the reform of the local Church without any reference to Rome, by summoning the famous Synod of Pistoia, whose decrees have been commonly described by opposite schools as an admirable programme of ecclesiastical reform or as supplying "an excellent summary of the belief and practice of a bad Catholic." There is probably a good deal of truth in both views. That those who took a leading part in the Synod of Pistoia were sincerely desirous of reforming practical abuses in the Church no impartial student of history can doubt, but there was in the proceedings a deep taint of what can only be called worldliness and Erastianism, which alienated religious sympathies. And hence, when the Court of Rome interfered to quash the whole concern, there was no effective moral resistance to its claims. And a very similar judgment must be pronounced on the Josephist scheme of ecclesiastical policy altogether. Even assuming his good intentions throughout, which would perhaps be rather a large assumption from a religious point of view, his reforms were in many cases vexatious, or indiscreet, or frivolous, or premature. Cardinal Newman has somewhere remarked that a people's religion is always a corrupt religion, and it requires very delicate handling to reform parasitical corruptions without rooting up the religion which they have at once enfeebled and enshrined in popular belief. And, whatever may have been the personal aims and convictions of the Emperor, there was undoubtedly a large admixture of religious scepticism or indifference in the agents and admirers of his policy. There is a story told of one of the Archbishop Electors of Mayence towards the close of the last century which may serve to illustrate the tone of feeling prevalent among the higher ecclesiastics in Germany. He was driving one day in his carriage through the streets of his episcopal city, when he passed a poor man who through some sudden accident was at the point of death. He was shocked at the idea of the man dying without the sacraments, and sent one of his servants to look for a priest; that he was himself qualified to render spiritual assistance seemed never for a moment to occur to him. Meanwhile a restless desire for change and distrust of existing institutions and principles had seized clergy and laity alike. As Ranke puts it, the inferior clergy were opposed to their bishops, the bishops were at strife with the archbishops, and they in their turn were at variance with the Pope. The most prominent point however in the reforming programme of the Emperor Joseph, and that on which he was himself most intent, was the complete subjection of the spiritual to the civil power. That such a design was in fact incompatible with the first principle of the Roman Catholic Church could hardly have escaped a less acute intellect than his. But later experience has proved that, in proportion as religious earnestness is awakened, all communions, Catholic or Protestant—as in the notable instance of the Free Kirk of Scotland—will refuse to surrender their independence to an external power. In these days however the problem, if it is in one sense more complicated, may prove less difficult of adjustment. The only question in the mind of the Emperor Joseph was as to

the relations of the Established Church to the Government; Church and State alike would have been unable to conceive of the modern alternative of disestablishment, which would at once suggest itself to a reformer of the type of Joseph II. now. That this is a complete solution of the difficulty we are very far from meaning to imply. After a century's experience of "Free Churches" in America, the scheme has yet to be produced—not on paper simply but in practice—which shall put an end to the chronic conflict between the rival pretensions of civil and ecclesiastical jurisdictions. So much however is pretty certain, that no statesman in the present day would be likely to attempt a revival of the drastic but abortive methods of Church policy which have immortalized for good or for evil the memory of the royal "Sacristan."

THE CATS OF COUNTY LOUTH.

IT has always seemed to us unjust that Kilkenny should have its traditional monopoly as the habitat of a certain variety of cat. The headquarters of the Butlers has had its praises celebrated sweetly in song, but there is not the least reason for believing that in pluck and bottom its cats are superior, when the fancy for "mutual suicide," as a great debater once called it in the House of Commons, takes them, to the cats of other places in Ireland. The recent libel case in which Mr. Sullivan, M.P., and Mr. Callan, M.P., were prosecutor and defendant, illustrates the fact quite sufficiently. Neither of these gentlemen, so far as we know, has the least connexion with Kilkenny; yet the result of their battle, morally, if not legally, must be allowed to be of a very Kilkennyish type. The brutal Saxon, in his cold-blooded sneering manner, has frequently remarked on the amiability of Irish members of Parliament in giving full information beforehand of the sort of thing that would go on in a Parliament House on College Green. This latest exhibition cannot be said to fall short of any former one. It was a pretty quarrel—a very pretty quarrel indeed. Why it should have been fought out in the Central Criminal Court of the capital whence the Saxon tyrannizes over Ireland by telegraph, instead of on the banks of the Liffey, nobody knows; but so it pleased the prosecutor, and so it was. It cannot be said that the defendant was equally pleased, or that he seemed to be so. Mr. Callan was for a long time rather coy in presenting himself on the ground; but at last, on Monday, things were arranged nicely and comfortably, and the legal equivalents for coffee and pistols were duly provided. Theoretically Mr. Callan must be allowed to have got the worst of it, inasmuch as the jury found him guilty; but the Judge put off the question of sentencing him in the hope that some arrangement might still be made. The interest for Englishmen, however, who have thus been obliged to make a ring for the decision of an Irish row, lies not in the result, but in the row itself. This, it has already been said, was a very pretty row indeed, calculated to exalt the character of Irish members of Parliament all over the civilized world, and to enable the lowly shamrock to hold up its head more than ever in the face of the insolent rose.

It is needless to say that the combatants of Monday had at no very distant period been the dearest and most intimate of friends. Most combatants—and most Irish combatants more particularly—have usually passed through this stage. There was a time when Mr. Callan cashed bills for Mr. Sullivan, and when Mr. Sullivan, with a beautiful mixture of the affectionately homely and the elaborately eloquent, described Mr. Callan as the "sublimated quintessence of a brick." If there was one thing, moreover, of which Mr. Sullivan was thoroughly convinced in reference to Mr. Callan as an electioneering person, it was of the manliness and straightforwardness of his conduct. But *tout passe, tout casse*. There came a time when Mr. Sullivan no longer regarded Mr. Callan as a polished corner-stone (at least, corner brick) in the temple of the Kingdom of Quintessence, and when he entertained the most serious doubts of his manliness and straightforwardness. For some considerable period, says his counsel, who ought to know, he simply and quietly withdrew his friendship from the man who had so sadly (but unexplainedly) disappointed him. The election of last spring, however, put an end, possibly to the simplicity, and certainly to the quietness, of Mr. Sullivan's relations to his old friend. Mr. Callan happens to be an exceedingly popular man in his own district, so popular that Election Judges, if we remember rightly, are of opinion that treating in his interest is scarcely a corrupt practice because the persons treated are pretty sure to vote for him without it. In the borough of Dundalk Mr. Callan was defeated by an English intruder. The county election coming off later, he, following a course of conduct not unknown either in England or Ireland, thought he would stand there. This upset Mr. Sullivan's plans, and his rage boiled over when, though he himself was elected, Mr. Callan was above him on the poll, and his own chosen colleague, Mr. Kirk, was at the bottom thereof. He accused the sublimated quintessence of a brick, the manly and straightforward friend of 1874, of black-hearted treachery; he declared before high heaven that nothing should induce him to sit with Mr. Callan, and he rated the electors of Louth in the finest Hibernian style for their conduct. Mr. Waddy says that Mr. Callan opposed Mr. Sullivan and his colleague "by means which he would not detail." The phrase is suggestive of terrible things, but the means, if we rightly remember the Blue-book on the subject, were Mr. Callan's own popularity, and a barrel of porter mixed with water in equal proportions—for such is the moderation of the men of Louth in the matter of fermented liquors. However, Mr. Sullivan told these thirsty and faithful persons that they had inflicted a black disgrace—perhaps in reference to the porter—on their gallant county. The distinction of the county and its inhabitants is, it may be noted, one of those things which a mere Saxon finds it hard to apprehend. "A shout of shame"—mark the alliteration—would, Mr. Sullivan thought, "resound all over Ireland." Finally, the result of the election was simply and quietly described as "a foul and unmanly blow levelled at Mr. Kirk." Now Mr. Callan was not pleased at this, which was natural; and, unluckily for him, he seems to have thought that the best retort for mud is mud of a muddier description. He telegraphed to a Dublin newspaper a paragraph insinuating rather than affirming that Mr. Sullivan had been supplied with money for election expenses by a Tory; and that in return for this accommodation he had omitted to organize a Home-rule opposition in the borough which his creditor represented. This was the libel complained of.

The evidence given at the trial, though Mr. Justice Hawkins strove manfully to keep it down to moderate dimensions, was of the finely discursive character usual in an Irish row—an opprobrious expression which is not our invention, but is suggested by the remarks of Mr. Callan's own counsel. The principal witness was Mr. Sullivan himself, Mr. Callan being, by the form of proceeding which his antagonist had chosen, prevented from giving his own version of the matter. Perhaps this was no very great loss; for it would be somewhat difficult for Mr. Callan or any one else to justify anonymous insinuations of the kind in which he had indulged. Such as it was, however, the evidence disclosed a state of things which, though doubtless harmless enough, is a little odd. The House of Commons has, we trust, not yet reached the condition of that Irish regiment extolled in one of Lever's novels as the perfection of friendliness and consummate financial arrangement, in which the colonel habitually drew on the major, the major on the senior captain, and so down to the junior ensign, who in his turn drew on the colonel. This consummation is probably reserved for the Parliament on College Green itself. But it seems that Mr. Sullivan, having, it is said, some money lying to his credit in America, obtained it by a bill or a note of hand given to Mr. Puleston, M.P., who in his turn handed on the document to Mr. Orrell Lever, M.P., who gave it to a wine merchant. The wine merchant seems to have escaped the attention of intelligent constituencies last April, and therefore the magic circle is not quite complete. However, the bill was duly met when it fell due, and that is all which anybody has a right to demand. That Mr. Puleston is a Conservative member is a fact, and so far Mr. Callan's telegraphic libel, as it is now decided to be, was true. It is also true that Devonport, the constituency which Mr. Puleston represents, does not rejoice in a Home Rule organization. But this, it seems, is because there are no Home Rulers to organize. There are not out of barracks a dozen Irishmen in Devonport, that happy, if not beautiful, town. So, though Mr. Callan's main facts were true, his insinuation was unproven and libellous, and he waits his sentence accordingly. The explanation suggested by Mr. Callan's counsel for the trying of the case in London, and not in Dublin, is so injurious that, but for the privileges of advocacy, Mr. Moloney would probably draw down Mr. Sullivan's wrath upon his own head. It is said, whether truly or not we cannot say, that on some former occasion when Mr. Sullivan felt himself libelled, his cruel countrymen, though they admitted the fact, assessed at sixpence the damages which he had himself estimated at three thousand pounds. The story is but too illustrative of the ancient saying about prophets and their compatriots.

We can easily understand that Mr. Justice Hawkins—painfully conscious of the fact that half the Judges are dead, or ill, or trying election petitions, or otherwise incapacitated—may have felt it a little hard that two days of his valuable time should have been taken up in witnessing the conclusion of this stramash. But we really do not know that it is wise to discourage Irish gentlemen, when they are inclined, to have recourse to the law. It is certainly not their most prominent or most troublesome failing at the present moment; and it would almost pay England to establish a separate division of the High Court of Justice, with a complete establishment of judges, to let them fight out their battles of all kinds in an orderly manner without Boycotting, or carding, or cutting off the tails of animals, or any of the other incidents of existing Irish dissensions. Besides, the favourable light which judicial investigations cast upon the character of the patriots engaged in them cannot fail to have the best effect. The consistency, the courtesy, the manly straightforwardness which have been disclosed in this present investigation are among the finest qualities desirable in legislators. The pure love of country which burns in the Irish breast, and which is the true excuse for certain boisterous exhibitions of feeling (such as the tail business just referred to) which are misunderstood by the sluggish Saxon mind, could hardly be better exhibited than by Mr. Sullivan's declaration that the gallant men of Louth had inflicted a black disgrace on their country by electing, not a Whig or a Tory, but a Home Ruler as decided as himself. Or perhaps, it will be said that this pure love of country is better illustrated still by Mr. Callan's eagerness to transfer the charge of using English gold to one of the most active propagators of the system upon which he himself is supposed to have set his heart as the only panacea for Ireland. There really is not much

left of these two gentlemen after their battle, though the verdict may perhaps justify us in assigning to Mr. Sullivan the "tail" of the original Kilkenny legend. The case as it stands is not quite satisfactory to vulgar curiosity, because it might have been interesting to hear Mr. Puleston's version of the story. But to aim at the too much is an acknowledged mistake, and the occurrence is quite rich enough in matter for meditation as it is.

PROSPECTS OF THE IRON TRADE.

THE course of the iron trade during the past twelve months has not been quite in accordance with the expectations cherished towards the close of last year. The large American purchases of iron had then given rise to a wild speculation which ran up prices extravagantly. But this rise of prices brought about a reaction, which put an end to the speculation and caused a fall almost as rapid, though not as great, as the preceding rise. During the fever of the speculation sanguine people persuaded themselves that we were immediately to witness once again an inflation like that of 1872-3; when the reaction came, despondent people concluded that the revival was only a spurt, and that the trade would speedily fall back into a state of depression. Both expectations have been falsified. There has been steady, but gradual and healthy, improvement. This improvement has been mainly due, of course, to a continued demand for consumption; but to a large extent also it is attributable to the moderation of the working classes. If the workpeople, when the wild speculation of last winter sent up prices so suddenly and extravagantly, had insisted upon sharing in the profits in the form of increased wages, they would have made it impossible for their employers, without a general cessation of production, to reduce prices the instant the speculation collapsed. Happily they showed better judgment, and the result has been that, between the lowness of wages and the economies introduced during the long depression, the employers have been able to adjust prices to the demand, and to go on producing on an ever-increasing scale, realizing at the same time a handsome profit. This moderation on the part of the working men has of course been beneficial to themselves as well as to the whole community. Furnace after furnace, previously blown out, has been relighted, and mills have been worked to the full extent of their power. Men out of employment have, in consequence, been taken on. The benefit to them and their families is evident enough; but it extends very much further. The men are now able to clear off the debts they had run up with tradesmen, and besides have more money to spend with the butcher and baker, the draper and bootmaker. These various tradespeople in turn, finding the money due to them coming in and the demand for their goods steadily augmenting, are in a position to lay in better stocks, and, moreover, to increase their own family expenditure. The wholesale dealers feel the effect, and give larger orders to the manufacturers. Thus the first improvement is transmitted from trade to trade and from class to class, the several steps in the process acting and reacting upon one another.

The magnitude of the improvement in the iron trade can be shown by a few statistics. According to Messrs. J. E. Swan and Brothers, there were in blast in Scotland at the end of last week 120 furnaces, against 99 in the corresponding week of last year. This is an increase in Scotland of over 20 per cent. According to the Cleveland Ironmasters' Association there are 118 furnaces in blast in the Cleveland district, against 93 at this time last year, being an increase of nearly 27 per cent. Thus, in spite of the collapse of speculation in the spring, and the consequent fall of prices, we have in these two important districts an increase of producing power ranging from 20 to 27 per cent. Again, according to the same authorities, we find the actual production in Scotland last week 481,000 tons, against 389,000 tons in the corresponding week of last year—an increase of nearly 24 per cent. In Cleveland the proportionate increase in October was about the same. These figures establish conclusively what we said above, that the trade all through the current year has been profitable, that more and more of the capital lying idle has been beneficially employed, and that large numbers of additional hands have been set to work. Yet prices are considerably lower than they were twelve months ago. Thus the price of Scotch pig iron at the end of last week was only 52*s.* 7*d.*, against 59*s.* 9*d.* at the corresponding date last year—a fall of 7*s.* 2*d.*, or 12 per cent. At Middlesborough the October price was 39*s.*, against 41*s.*—a fall of 2*s.*, or nearly 5 per cent. It is to be borne in mind that the speculation was in full swing at this time last year, and that prices then were much above those that ruled in the spring. Since the spring, in fact, there has been a recovery, although there has been a fall as compared with twelve months ago. As there has been an advance since the spring contemporaneous with a great increase of production, it seems to follow that consumption has increased more rapidly than production. But many persons deny that this is the case, and allege, on the contrary, that speculation has again sprung up, and now, as last autumn, is the real cause of the advance in prices. In support of this contention there is the indisputable fact that the exports of iron have greatly fallen off. The shipments to foreign ports and coastwise from Cleveland and the Clyde during September and October appear indeed to have decreased nearly 19 per cent., compared with the corresponding months of last year. Thus we have this very curious state of things—a rapidly increasing production, prices not so high as twelve months ago, but higher than in the spring, and steady, a general feeling in the trade that we are on the eve of a period of extraordinary prosperity, causing a demand on the part of workmen for an advance of wages and a disposition on the part of employers to give it, and yet a marked decrease in shipments, showing a falling off in the foreign demand. Some persons, as we have already said, explain the facts by the prevalence of speculation. Others, admitting the speculation and the support it affords to prices, allege that it rests on a solid basis of increased consumption, just as the speculation of last winter was called into being by the American purchases, and they contend further that the increase is in the home consumption. It is quite clear that if, as we have shown to be the case, the production has increased about 24 per cent. compared with a year ago, while the consumption has decreased 19 per cent., the stock on hand ought to have augmented 43 per cent. But, as a matter of fact, the increased stock in the public stores in Cleveland is only about 8½ per cent., and on the Clyde the increase is quite insignificant. It may be, of course, that the stock in the hands of makers has increased enormously. On that point, unfortunately, we have no statistics. But, if it be not so—and we know of no reason why it should be so—the home consumption must have increased immensely. Theoretically we should look for such an increase. We pointed out just now how a revival in any one great trade is transmitted through every other trade. As each of these improves, each person engaged in it finds himself better off than he was before; he looks upon everything with more hope, and every one he meets is equally cheerful. He is thus encouraged to enter upon an expenditure which perhaps he had long been meditating, but did not feel justified in incurring. He improves his machinery, enlarges his premises, and so on. Now it was in the iron trade that the revival began last year, and naturally it took some time for that revival to act upon other trades, and for these in turn to react upon iron. As regards the foreign demand, which, as we have seen, has greatly fallen off, there are symptoms of a large increase in the near future. A fortnight ago, when writing about the railways of the world, we remarked that railway building in most countries is yet in its infancy, and that we might expect another period of active construction. Short as is the time that has since elapsed, we have already had something to confirm the accuracy of our forecast. To go no further than the American continent, a Syndicate has just undertaken to advance within the next three years eight millions sterling to complete the Northern Pacific Railroad—the line which ruined Mr. Jay Cooke, whose failure in 1873 began the great New York panic. Then we have plans on foot for opening up Mexico by means of railways. And, lastly, there are rumours of an Argentine Railway Loan. All these projects mean a largely augmented consumption of iron and steel.

With the improvement in the iron trade there has been a marked enhancement in the value of iron Companies' shares. The writer of an article in the *Statist* of November 20 has been at the pains to work out in detail and tabulate the movement in the prices of the shares of fifty-two iron and coal Companies dealt in upon the Stock Exchanges of the country. It would be out of place here to follow him in his classification, or to note the effect of additions to or reductions of the capital of some of the Companies. But the broad results which he brings out are very striking. Taking the par value—that is, the nominal amount of the capital—to be represented by the index number 100, the writer shows that in December 1877 the market value was only 68; in other words, the depreciation was then 32 per cent., or very nearly one-third. In May 1878 the market value had fallen to 63·1, a depreciation of almost 37 per cent. In August 1879 the market value had actually fallen as low as 47·7; that is to say, the depreciation had reached 52·3 per cent., or, in other words, more than half the value of the shares was lost. This was the extreme limit of the depreciation, and it speaks eloquently of the depression which had fallen upon the iron and coal trades, and of the deep discredit into which the properties had fallen. Just then the American demand set in, and the value of the properties began to rise steadily. In October last the market value was represented by 78·4; in other words, it was 10 per cent. higher than at the end of 1877, the depreciation being, in fact, only 21·6 per cent. Compared with August of last year, the rise is from 47·7 to 78·4, or 30·7, being over 64 per cent. from the point of starting. Or, to put the matter differently, whereas a holder of one of those shares in August of last year would have got on sale only 9*s.* 6½*d.* in the pound on the nominal capital, in October last he would have got 15*s.* 8*d.*; and the upward tendency still continues. Assuming that the rise has been in the same proportion in iron and coal property not dealt in on the Stock Exchange, it will be seen how immense is the increase in the wealth and resources of all who are engaged in those two vast industries.

PICTURE EXHIBITIONS.

THE Winter Exhibition at the French Gallery is as usual distinguished by the possession of one large picture of undoubted merit, which is in this instance M. Luminais's "Les Enervés de Jumièges," a work in which a somewhat ghastly subject is treated with great power and skill. Some people may wish that the painter's art had fixed on a more agreeable theme,

just as there are some people who dislike or resent the representation of any suffering either on the stage or in fiction. In M. Luminais's work there is none of the vulgar obtrusion of physical pain which may be justly reprobated, and which is, as a rule, not reprobated by the class of people which we have indicated. The same mind which is bored by a fine tragedy or a finely tragic picture will be delighted with reading every vulgar detail and looking at every vulgar woodcut of a horrible accident. In the one case, a certain call is made upon thought and emotion; in the other, no appeal is made to anything above the lowest feelings, which are, it is to be feared, more or less common to humanity. The question might be a not uninteresting one to pursue, but further consideration of it at present would take us too far from M. Luminais's picture. The motive of this is explained by the words given in French on the frame of the picture itself, and translated into English in the Catalogue:—"Clovis II., having conquered his rebellious sons, crippled them by destroying the sinows of their legs, placed them in a barge, and abandoned them to the current of the Seine. The unfortunate princes were, however, rescued by some monks from the Monastery of Jumièges, who perceived their helpless condition." In M. Luminais's work there is no hint conveyed of the succour which finally came; we are shown only the barge drifting down the stream, and carrying the two princes at the caprice of the river. The colouring, both in the landscape and in the figures and their surroundings, is cast in a low tone. The dull yellows and greys of the drapery are relieved only by the dull red of the cushions against which the heads of Clovis's sons lean, and which are supported on an upright board covered with a black cloth. The painter's strength is apparent enough in all these details, but is more fully shown in the expression which he has given both to the hands and the faces of the wretched young men, whom one simple-hearted critic, deceived apparently by the sound of the French word, has described as looking "enervated." The expression in each case is entirely different and terribly true. The picture is instinct with force and feeling, and is of course all the finer for being painted with complete restraint and avoidance of anything approaching to clap-trap.

Many of the smaller pictures illustrate in a curious way the remarks which we quoted last week from Mr. Atkinson's *Art in Germany* as to the mania for tiny pictures. M. Sell, for instance, sends three or four works of this kind, all of them dealing with the somewhat well-worn subject of the Franco-German war, and all of them executed with a vigour and dash which might, one would think, be advantageously employed on larger canvases. The best of them perhaps is "Surprised" (197), which has a remarkable air of life and movement; but we doubt with Mr. Atkinson whether the encouragement of pictures which have to be looked at through a magnifying glass is desirable in the interests of art. Another and an admirable work, dealing on a larger scale with the same subject, will be found in M. Médard's "I' th' Imminent Deadly Breach" (77), which is a sombre and powerful picture. M. Seifert has on the first wall two somewhat curious pictures, both remarkably smooth and careful in execution, both wanting in solidity and life, but yet having a certain attraction. The second, "I Know a Maiden Fair to See" (5), is painted on a gold background. Among the landscapes three or four are exhibited by M. Heffner, and one of these, "A Flitting Gleam before the Storm" (59), has much beauty and originality. A fine and striking effect is produced by a heavy mass of cloud which seems to be rolling up to the spectator from the background, and which contrasts well with the excellently managed light in the foreground. In other pictures of M. Heffner's (9, 75) the treatment is less skilful, and the one last named suggests a not altogether happy reminiscence of M. Munthe, who is well represented in the Gallery, especially by "Ice-bound" (125), which is in his happiest vein. Whatever faults may be found with M. Heffner's work, it is in pleasing contrast to the specimens of native art contributed by Mr. B. W. Leader, whose radically vicious method certainly does not improve by constant repetition. His "Making Hay while the Sun Shines" (70) presents a really startling resemblance to the tin images of trees and men with which most of us have been delighted in our childhood, and the same curiously angular, metallic, false, and flickering touch runs in perhaps a somewhat less degree through all the work which Mr. Leader shows. From the fact that Mr. Leader continues year after year to produce work of this quality, it may be supposed that it commands a certain measure of success; and that this should be so is not an altogether happy reflection, so far as the true interests of art are concerned. Mr. W. H. Bartlett contributes a work which has much promise in "Netting Eels on the River Loire, near Fontainebleau" (109). With some faults, among which are a certain hardness of quality and a conventional rendering of the water surface, the work yet has a work and spirit which are distinctive and attractive. Another and a smaller truth by the same painter, "Happy Childhood" (50), is also marked by much excellence of feeling; but the drawing in the lower part of the picture is unhappy. Just above the "Netting Eels" are two remarkably fine pictures painted on the miniature scale, to which we have before referred, by M. Wenglein, "Sportsmen in Bavaria" (101) and "A Good Day's Sport" (111). The quality of light and the sense of movement in these two works are very striking. The place opposite to M. Luminais's large picture, already described, is occupied by M. Priou's "A Satyr Family" (162), a work which contrives to give freshness to a subject which is old-fashioned enough. The attitudes of the group, and notably of the father, are full of spirit, and the effect of the picture is decidedly attractive. Among other works in the Gallery we may specially mention two excellent landscapes (192, 194) by Herr von Bochmann, a view of Venice, something after the manner of Guardi, by Signor Pinazio (196), and "The Dream" (195), by M. Benlliure, a very odd work with a good deal of grotesque power.

There is a considerable amount of interesting work to be seen at the Fourteenth Winter Exhibition at the Dudley Gallery. As far as well-known painters are concerned, perhaps the most remarkable pictures to be found there are those contributed by Mr. Henry Moore. One of these, "A Shower Clearing off at Sunset" (218), is a work of the highest merit. The beauty of the composition and the colouring have much attraction; but, as an artistic feat, the extraordinary skill with which a transient effect has been seized is yet more remarkable. Another picture, a sea-piece, is an unusually fine specimen of the artist's work, but it is perhaps less striking than the picture just described. Mr. MacWhirter sends two pictures which are, it is to be feared, more daring than successful. One, "Thunderstorm on the Grand Prairie" (167), with a train crossing through the storm, inevitably suggests comparison with Turner's well-known picture, and the comparison is not altogether favourable to Mr. MacWhirter. The other, "A Summer Storm, Venice" (255), is far more successful, but is disfigured like the first picture by the curious method adopted to indicate lightning. Mr. Macbeth's "A Brittany Waitress" (30) is a disappointing work, unpleasing in colour, and devoid of any attraction in expression or in technical skill. Mr. John O'Connor's "Paul's Wharf" (84), is a very bright and attractive work, which might serve as a good practical answer to people who complain that London has no beauty and no sunlight. Another picture which deals with the river, and a picture of remarkable merit, is Mr. Arthur Severn's "Westminster at Sunset" (76), which has much dignity and tenderness. The painting is good throughout, and especially so in the treatment of the dying light falling on the water. Mr. G. D. Leslie sends two pictures (150, 162), which, it is to be hoped, no one but Mr. Leslie could have painted. Two works by French artists are particularly striking, "Le Calvaire de Mont St. Père" (190), by M. Léon Lhermitte, and the "Vue de Rouen" (367) by M. Jules Lessore. The combined breadth and minuteness of the last-named work are admirable. Mr. Heywood Hardy has a fine dashing riding picture, "The Old Squire's Favourite" (157), and an excellent "Study of Foxhounds" (96). On the same wall as this hangs a curiously daring and, it may be added, successful work, "The Scarlet Ibis" (128), by Mr. Matthew Hale. Almost every conceivable hue and variety of red has been brought into the picture, with an audacity which is, however, excused by the harmonious result. Another curious and clever work is "My Wood-Engraver's Bench at the *Graphic*—Gaslight" (167), by Mr. E. H. Godard. Among the sea-pieces Mr. Joseph Henderson's bright and pleasant "A Fresh Breeze" (204), and Mr. Napier Hemy's admirable "Over the Bar" (258), attract special attention. Several small pictures of merit have been "floored." Among them we may mention Mr. H. T. Vernède's "Foris, Ischia" (323), Mrs. Gosse's "Fort Beauregard, Besançon" (285), and Mr. Bevan Collier's "Medmenham" (289). Just above these last hangs a very pleasing work by Mr. C. E. Holloway, "Low Tide—Ravenglass" (292). On the screen are two admirable pictures by Mr. Clem Lambert, "Eel Spearers" (424) and "Low Tide" (441). Mr. T. M. Rooke's panel of "Lucretia" (421) is a little disappointing. On the wall, close to the screen, is a capital study of "Leopards" (371), by Mr. G. E. Lodge. The show of sculpture is not particularly brilliant or extensive; but Mr. Lawson's "Jeannie Deans" (456), and Mr. Hamo Thornycroft's "Study of a Head" (461), are both works of merit.

At the Hanover Gallery in New Bond Street there is an exhibition of oil-paintings by British artists, and of original drawings and sketches made for *Punch* by various artists. The largest picture exhibited is Mr. R. B. Browning's "The Delivery to the Secular Arm—a Scene during the existence of the Spanish Inquisition at Autwerp, 1570." The painting is careful, hard, and for the most part uninteresting. The girl who is the victim, and the soldiers who guard her, are curiously wooden, and the colour is not pleasing. The best thing in the work is perhaps the air of fanatical conviction given to the face and figure of the presiding judge. The pictures are, for the most part, from well-known hands. The President of the Royal Academy sends two charming landscape sketches and a study of a head (31, 60, 61). Mr. Alma-Tadema's "A Mirror" (103), and his water-colour, "Watching the Passers-by" (74), are in his best manner, and Mrs. Alma-Tadema's "Helping the Gardener" (111) is a very pretty and real study of child life. Mr. John O'Connor's "Verona from the Ponte Nuovo" (99) is admirable for its brightness and breadth without carelessness of execution. Of Mr. E. J. Gregory's contributions, "At the Welsh Harp" (102) is the best; and of Mr. Collier's works we prefer "Streatley" (75), and "From my Window at Lucerne" (37). Mr. Watts sends his admirable portrait of Mr. Robert Browning, and "The Temptation" (98), a work of much beauty. The *Punch* drawings are of course full of interest.

THE OPERA.

WHEN last we noticed the opera at low prices, we ventured to hope that there might be an improvement in the representations as the season grew older; but we are sorry to say that the hope has not been realized. With all the promises made at the commencement of the season, we cannot but feel that there has been "great cry but little wool." Whether it is remunerative to present to the public a series of well-worn operas with decidedly inefficient castes is a question we have nothing to do with. What we have to do with is that a number of second-rate, or worse than second-rate, artists have filled first-rate parts, and that, with few exceptions, we have to record a series of at best poor performances of most of the favourite operas. Mr. Carl Rosa has shown what *ensemble* without "stars" can accomplish. Some of the present performances have shown fully what can be reached by the absence both of particular and general excellence.

Since we last wrote we have had several new performers presented to us in leading parts in well-known operas. Mme. Giovannoni-Zacchi as Valentina in the *Huguenots*, Signor Aldighieri in *Rigoletto*, and Mme. Amadi as Maffio Orsini in *Lucrezia Borgia*, have been successively presented to the public, but to none of them is it possible to give the honour of the first rank among operatic artists. Added to this, there have been introduced a number of persons to perform important parts whom the management itself considers unworthy to appear in print, as their names are conspicuous by their absence in the programme.

At the first production of *Les Huguenots* Mme. Giovannoni-Zacchi made her *début* before a London audience as Valentina. A dramatic soprano, as it is called, of considerable experience, she is yet the least pleasing singer that we have seen in the part. To begin with, she is hampered with a tremolo which on our stage is fortunately considered anything but an accomplishment worthy of praise; and it may be remarked that nearly every one of the *prime donne* which Mr. Armit has presented to us is more or less tainted with this fault. Mlle. Rosina Isidor, Mlle. Lorenzini-Gianoli, and now Mme. Zacchi, all indulge in the artificial trick, and are proportionately irritating. The consequence is that many people are led to think that the *sostenuto* style of singing is not in favour on the Continent, which is very far from the truth. As to the other parts in this opera, Signor Vizzani as Raoul was passable, Signor Bonetti as Nevers tolerable, but Signor Quintilli-Leoni as St. Bris was hardly, we think, in his natural element. Signor Antonucci's Marcello was a remarkable performance. The weakness of this singer's memory gave the conductor an opportunity of displaying his vocal powers. We may perhaps arrive at a time when the conductor will be expected to take a prominent place in the vocal parts of an opera, but we think that the period has scarcely yet been reached when the audience will look with favour upon the feat. The one redeeming feature in the performance was, of course, the Urbano of Mme. Trebelli. It is unnecessary to speak of it further than to say that for grace and dramatic power it was unequalled, and made that part of the performance in which she appeared really enjoyable to the audience.

Signor Aldighieri, in *Rigoletto*, was another novelty. A six-foot hunchback is rather an anomaly; but, nevertheless, Signor Aldighieri acted the part with a great deal of vigour and with much feeling. In the ghastly scene where he appears before the courtiers with the knowledge that he has been the agent in the destruction of his own daughter's honour, in fulfilment of the curse of Monterone, and also in the subsequent scene with Gilda, he showed that he was an actor of considerable merit. Signor Runcio's Duke was a careful, albeit a somewhat colourless, rendering, and in the one song that he is expected to shine in—namely, "La donna è mobile"—he failed to give the effect with which Giuglini was formerly accustomed to entrance the audience. Signor Antonucci again compelled unwilling attention to his performance. He is not the first Sparafucile whom we have heard attempt the part with insufficient knowledge, and he is far from being the best among the singers whose failure in the character we remember. The part of Gilda was taken by Mlle. Giulia Bressolles (who appeared in *Les Huguenots* as Mlle. de Bressolles) "at a moment's notice and without rehearsal," and in consideration of that fact we refrain from criticism.

The new singer in *Lucrezia Borgia* was Mme. Amadi, as Maffio Orsini. Rather a mezzo-soprano than a contralto, Mme. Amadi combines a sympathetic voice with considerable stage experience, and altogether presents us with a very creditable representation of the character she undertakes. Signor Runcio played Gennaro, and Signor Ordinas Alfonso. The latter, in the opening of the first act, not only sang painfully flat, but in the aria "Vieni la mia vendetta" again indulged in the offensively "yapping" utterance which we had occasion to notice before in his rendering of "Dio dell' or" in *Faust*. Mme. Zacchi's Lucrezia presented no startlingly new features, and her persistent tremolo was as irritating as formerly. With the notice of these four singers we have exhausted the printed caste, and as to who Gubetta, Rustighello, and other of the eleven *dramatis personæ* are, we are totally left in the dark. It is a pity, for we might have said something in their favour had we known their names; but it is hardly worth while to waste praise upon nameless personages. The management consider them unworthy of notice, and that must be enough for us.

Last Thursday week Signor Tito Mattei's opera of *Maria de Gand* was produced. The libretto is the work of the Italian novelist and dramatist, Signor G. T. Cimino, and the English words, which have the advantage of being really a translation of the Italian, are by Mr. Henry Hersee. This work was, we understand, first produced in private at St. George's Hall, in 1878. Since then, however, the greater part of it has been remodelled and made to suit the exigencies of the larger stage of Her Majesty's Theatre. The applause which greeted the composer at his entrance into the orchestra was continued throughout the piece, and if that be any criterion of success, Signor Tito Mattei may be said to have attained a triumph.

The action of the opera takes place in Brussels just at the time when Alva has been sent to enforce the laws against heresy by Philip II. The first act opens with a bal masqué at the house of Giorgio di Gand. Giorgio enters reading a letter which informs him that Riccardo Orley, a great friend of his and a former lover of his wife, is coming. He is much disturbed, for he knows that Riccardo is watched as a suspected conspirator. At this moment his hears his wife Maria singing a love song which arouses his suspicions that she is in love with Riccardo, and in a scene of some power strives to believe that his suspicions are false. Maria enters, and on learning that Riccardo is coming, begs her husband not to harbour him. Giorgio, assured, says that he will never refuse asylum to a faithful friend. The festivities continue, when Riccardo appears masked and is recognized by Maria. Giorgio warns Riccardo of his danger, and he determines to fly away to an old castle of his at Laeken. At this juncture a certain Andrea van Heysen appears, rather the worse for drink, and after insulting one of the guests, proceeds to fight him, but is interrupted by Giorgio, and the curtain falls. The second act shows us Riccardo Orley's ruined castle. After apostrophizing the ruins, he is joined by some fellow-conspirators, who swear allegiance to his cause. As they are going off the stage Maria and her attendant Anna enter, and Riccardo is overjoyed to find who the masked lady is. She comes to beg him to fly the country, as he is watched by the Spaniards; but he, confident in the success of his conspiracy, at first refuses; when, however, he finds that she is really in love with him, he relents and is about to go off with her. Just at that moment the advance of the Spaniards is announced, and he determines to remain and carry out his plot. As the Spaniards approach he leads Maria away by a secret passage to her castle. The square in front of the Hôtel de Ville in Brussels is the scene of the third act, which opens with the entry of Alva into the town amidst much martial music. The fatal edict against heresy is displayed in the centre of the stage, guarded by two soldiers in armour. Riccardo and his friend Giorgio enter and read it. Alva, in his speech to the people, reminds them that there are some amongst the Flemings who accuse the King of tyranny. Giorgio, upon this, rashly comes forward and declares that he is amongst these, and delivers himself of a diatribe against foreign soldiers, war, and broken faith. Riccardo, seeing his friend in danger, with all the foolhardiness of a conspirator comes to his assistance, and, after calling Alva a villainous bandit, proceeds to tear down the edict with his sword, and calls on the Flemings to rise. Of course he is arrested, much to Maria's grief, who is present all the time. At this point one Marco, a captain of Alva's guard, enters, and states that all Riccardo's fellow-conspirators have been arrested except one, a lady, who came out of Giorgio's house at break of day; and the act ends in an *ensemble* depicting the misery of Riccardo and Maria, the jealousy of Giorgio, whose suspicions are again aroused, and the exultation of the captain of the guard. Just as the curtain is about to fall, however, Anna, Maria's attendant, declares that she was the lady who went out to meet Riccardo, and is accordingly arrested. The fourth and last act is taken up with the misery of Maria at her lover's fate, and her determination, when she learns that Anna is to be executed, to deliver herself up as the culprit. To effect this she writes a letter to Alva, which she entrusts to the drunken Andrea. He, however, is surprised in an inebriate state by Captain Marco and Alva's soldiers, and brought back to Giorgio, who reads Maria's letter. In a wild fit of jealousy he determines to kill her himself. This he proposes to do by poison, and having poured it from a ring which he wears into a glass of wine, he meets Maria, who now enters, and asks her to drink to his departure for England, whither he intends to go to lay the matter of the suffering Flemings at the feet of Elizabeth. She agrees, and is about to drink, when a sudden impulse seizes him, and he exchanges glasses with her and drinks. He then begins to upbraid her for her unfaithfulness to him, and she, sinking on her knees, begs him to kill her. He tells her it is too late, that he himself is a dead man. Just then Marco enters to say that Anna is free, and she is in time to be present at Giorgio's death, which ends the opera.

Of Signor Mattei's music it is sufficient to say that it is pretty and pleasing without any evidence of originality or vigour. He has doubtless studied the best of the great Italian operatic writers, and has profited by them. Certainly, nothing that we could see justified the triumph that was accorded him, and the march in the third act, which was redemanded, is, to our thinking, the least worthy part of the work. The history of this encore is perhaps unique in the annals of Italian opera. At the end of the march much enthusiasm was displayed by the audience; but, instead of waiting till the applause had died away, to the astonishment of every one the whole of the crowded stage seemed to have been seized with a sudden panic, and scuttled away (there is no other word to express the flight) in disorder. This was through no alarm of fire, as we at first thought, but on account of the applause, and

the whole pageant was repeated. We shall soon be having whole acts repeated if this is to be encouraged, and an opera will last for a week at least. The best pieces in the opera seemed to us on a first hearing to be the "Reca un suono" of Giorgio, in the first act; Andrea's rather humorous song; Riccardo's song, "Al sospirato termine," in the second act; and Maria's *scena*, in the fourth act, beginning "Non giova fuggir!" Some of the choruses are also effective, and the ballet music is pretty. Much credit must be given to Mme. Katti Lanner for her very tasteful arrangement of the ballets. Mme. Giovannoni-Zacchi appeared as Maria, and sang her part with great credit, and acted with power. She was, however, to our mind, guilty of strange want of taste when, in the first act, she appeared on the stage in answer to applause for a song that she sang behind the scenes. Signor Aldighieri sang Giorgio, and Signor Ordinas, who was evidently in very poor voice, took the part of Marco. Signor Runcio was Riccardo Orley, and sang his part like an artist, whilst Signor Pro made a passable but very undignified Alva, and Mlle. Barnadelli was Anna.

It is pleasant to turn from such performances as we have spoken of to the consideration of the rendering of Berlioz's *Faust*, lately given at St. James's Hall. We can only regret that its author did not think fit to frame the dramatic legend of Faust for the stage, for if ever there was a musical composition fitted for dramatic representation, it is this one of Hector Berlioz. It was otherwise decreed however; and certainly Mr. Hallé's well-trained band and chorus worked under their able conductor with a determination to do honour to the piece worthy of all praise. Berlioz treats the story of Faust much in the same way that others who have most evidently learned much from him have done, with the exception that his Faust signs the bond with the fiend in order to save Marguerite if possible. Unlike those who followed him, and even Goethe who preceded him, Berlioz has softened the selfish element in Faust's character, in giving him a purpose in sacrificing himself for his love. It is true that he is deceived by Mephistopheles, but not the less does this add to Faust's heroism in selling his soul to save Marguerite. Of the performance nothing but praise can be spoken. Under the direction of such a consummate musician and so masterly a conductor as Mr. Hallé, and with the assistance of such artists as Miss Davies, Messrs. Lloyd, Santley, and Pyatt, only a fine performance was to be expected and realized. The "Hungarian March" and the beautiful ballet of Sylphs, amongst other pieces, were redemanded, and the weird Serenade received the applause that the singing of Mr. Santley deserved. The last-mentioned piece, the parent of all *Faust* Serenades, seems to us one of the most dramatic portions of the work, the "ah!" of the chorus at the end of the stanzas being almost electrifying. The want of action alone was felt, and this, although supplied to a certain degree by Mr. Santley's admirable delivery of his part, made us long all the more that the work had been written for the stage. We may take another opportunity of speaking of this great work.

REVIEWS.

ENDYMION.*

THE wiseacre who discovered that Lord Beaconsfield's novels are profoundly immoral will be confirmed in his opinion by the study of *Endymion*. There is no trace in it of the enthusiasm of humanity, or of deep interest in social progress; and, if the author's tastes and sympathies are not worldly, he confines himself to the delineation of worldly characters. In the same sense the *Arabian Nights* are not less immoral, and yet they have amused many generations in the East, and five or six in the West. Endymion, the hero or subject of the present story, bears some resemblance to Aladdin, who began his career as a naughty boy, and, without merit and almost without exertion of his own, became son-in-law and prospective successor of the Sultan. It is the nature of the hero of a novel to be passive, colourless, and uninteresting. He must be good-looking, courageous, and, if his historian may be trusted, spirited and able; but his qualities are taken for granted, instead of being displayed in speech or action. Scott sometimes attempted to escape from a necessity which seems to be imposed by the laws of fiction; but Waverley, Ivanhoe, Henry Morton, and Roland Graeme are the same lay-figure adapted to each immediate purpose by the assumption of different costumes. The person to whom everything happens cannot without inconvenience determine the course of events. For the purpose of a cheerful story, such as Lord Beaconsfield likes to tell, it is principally important that the hero should be naturally and habitually fortunate. Aladdin had early in his life the good luck of acquiring the rusty lamp to which were attached the services of the all-powerful genie; and when he was for a time deprived of his principal talisman, he had at his command the less marvellous powers of the slave of the ring. Endymion was provided with not less potent auxiliaries in the form of three beautiful countesses, who occupied themselves wholly with the care of his fortunes. Lady Montfort, the wife of an Epicurean magnate, once familiar to Lord Beaconsfield's readers as the Marquess of Monmouth, ultimately bestows her wealth on Endymion as her second husband. Lady Beaumaris, with whom he had been half in love while he was wholly in love with Lady Montfort, induces her husband at a critical period in Endymion's career to provide him with a seat in Parliament, though they belonged to opposite parties. Endymion's twin sister, Lady Roehampton, was wife of a statesman undistinguishable from Lord Palmerston, and ultimately she became Queen of an unnamed kingdom, or rather Empress of the French. There was also a genie of the ring to intervene when Endymion's ordinary protectors were powerless. Adriana Neuchatel, the greatest heiress in England, made Endymion an anonymous present of 20,000*l.* without raising a suspicion as to the donor. When, after his marriage with Lady Montfort, the secret was disclosed by the Empress, Endymion or his sister repaid Adriana by an equally anonymous wedding present of suitable value. Aladdin, on the eve of his marriage, sent to the palace a procession of forty black slaves dressed in silver stuffs embroidered with flowers of gold. Each bore a basin on his head full of pearls, diamonds, rubies, and emeralds, the largest and finest that had ever been seen. On the day on which she became Viscountess Waldershare, Adriana received from a foreign land a casket of crimson velvet, which caused some excitement. "But when it was opened! There was a coronet of brilliants; a necklace of brilliants and emeralds, and one of sapphires and brilliants; and dazzling bracelets, and all the stones more than precious; gems of Golconda no longer attainable, and lustrous companions which only could have been created in the hot earth of Asia." Perhaps they were Aladdin's jewels dug up, after the lapse of ages, in the ruins of his palace. "When the revolution comes," said Adriana's father, Lord Hainault, "Lord Waldershare and my daughter must turn jewellers. Their stock in trade is ready." Lothair's famous ropes of pearls must have been comparatively insignificant in value.

At the beginning of the story, the twin children, Endymion and Myra, are living in the luxurious home of parents whose private fortune had without their knowledge disappeared, while the father, Mr. Ferrars, had on several occasions been disappointed in the hope of retrieving his position by obtaining high office. On the retirement of Lord Liverpool, he attached himself to the Duke of Wellington, while his more sagacious friend, Mr. Sidney Wilton, enlisted himself among the followers of Canning. The hopes which had been suddenly checked by the great change of 1830 revived for a moment when the Duke of Wellington undertook to form a Cabinet in 1832, and offered Mr. Ferrars the place of Secretary of State, and leader of the House of Commons. Excited by a summons from the Duke, he called at Apsley House, to be courteously and calmly informed that the acceptance by a large majority of the House of Commons of Lord Ebrington's resolution had compelled the Duke to abandon his attempt to form a Ministry. About this time Mr. Ferrars's father died, having both dissipated his own fortune and fraudulently tampered with the property of his son's wife. The family retired to a remote country house which was let on cheap terms, and the father employed himself in the education of his children. One more gleam of hope on Peel's accession to office in 1834 soon faded away, with no result except the nomination of Endymion to a clerkship at Somerset House. Mrs. Ferrars died; Mr. Ferrars committed suicide; and Myra began her self-appointed task of restoring the family to wealth and affluence by becoming the companion and friend of Adriana Neuchatel. At this time Endymion was sixteen; and it took him, notwithstanding the efforts of the genie of the lamp, nine or ten years to rise from his humble desk in Somerset House to be Prime Minister of England. Aladdin perhaps enjoyed less his still more miraculous ascent to the height of prosperity and power. A successful adventurer, pushed upwards by unseen and irresistible agencies, is a more interesting object than a helpless Lothair born and destined to die in the purple. The biographer bears witness that Endymion was industrious and practical, and that he had a native faculty of speech. In two first essays, at a debating society and in the House of Commons, the young orator was at first overwhelmed with nervousness; but on both occasions he recovered the thread of his argument, and received deserved applause. Sir Robert Peel himself condescended to answer his maiden speech, with the result of causing just and lasting offence to his own Under Secretary. As Lord Beaconsfield gravely remarks, the Minister would have done better to give his subordinate an opportunity, reserving to himself the correction of any error or oversight which might have been committed. Endymion attracts not only the love of all women, but the favour and confidence of all men who can serve him, including the husbands of the ladies with whom he has sentimental relations. With a dispassionate regard to Endymion's interests, Lord Beaconsfield makes him a Liberal and a leading member of the Opposition when "a dozen men without the slightest experience of official life had to be sworn in as Privy Councillors" in 1852. "One of this band, a gentleman without any official experience whatever, was not only placed in the Cabinet, but was absolutely required to become leader of the House of Commons, which had never occurred before, except in the instance of Mr. Pitt in 1782." Lord Beaconsfield takes the opportunity of defending himself and his colleagues from the charge of rashness. If, he says, they had not "dared these ventures," they never could have acquired sufficient official experience to form a Ministry, and "the result has rather proved that they were right." The hero of the present story, when he faced the Treasury Bench, little suspected that the inexperienced gentleman who was Chancellor of the Exchequer would occupy his leisure when he ceased to be Prime Minister by writing the history of Endymion.

* *Endymion.* By the Author of "Lothair." London: Longmans & Co. 1880.

Lord Beaconsfield is no believer in the speculations on tendencies and inevitable changes which are sometimes called the science or philosophy of history. Almost the only general proposition which he affirms, and frequently repeats, is that political forces are principally personal. It was through a knowledge of the statesmen of Europe that Lord Roehampton, who is Lord Palmerston, was a great Foreign Minister. Political economy and similar studies are the resource of politicians who are not in society, and who cannot talk French. As on many former occasions, Lord Beaconsfield persists in attributing the triumphs of democracy to the imaginary fact that Europe is "honeycombed by secret societies." Like the old Greek mythologists, or like a modern divine who attributed rain to watering-pots used by angels, Lord Beaconsfield ascribes all political results to individual agency. The machinery is at least indispensable to his romances of adventure. The characters which he describes are not solar myths, or impersonations of natural forces, but men and women connected with each other by love, friendship, or enmity, and for the most part moved by an ambition which is not always ungenerous or ignoble. For the purposes of fiction Lord Beaconsfield forgets his own transfer of political power from the aristocratic society in which Endymion moves to the capricious multitude which raised his biographer to power in 1874, and overthrew him in 1880. Lady Montfort and Lady Roehampton can now do little to promote the fortunes of their lovers and their brothers. The old aristocratic Constitution which long survived the Reform Bill has, by successive changes, been almost wholly abolished. It will live some years longer in Lord Beaconsfield's novels.

In none of his former works has he indulged so largely and with so little disguise in his favourite reproduction of real personages in a more or less transparent mask. The founder of the Ferrars family is identical in character and circumstances with Pitt's faithful follower and confidential assistant George Rose. Mr. Sidney Wilton bears no special resemblance to Mr. Sidney Herbert of Wilton, except that he holds a political and official position one degree below the highest. Mr. Job Thornberry represents Mr. Cobden, whose eloquence is felicitously described in an account of a Corn-law meeting at Manchester. The circumstances of Mr. Thornberry's later life would have perplexed and annoyed his living prototype. Mrs. Thornberry, who is first introduced as a zealous devotee of a Unitarian preacher, joins the Roman communion; and his son, John Hampden Thornberry, puts up portraits of Laud and Strafford over his mantelpiece, and, "embossed in golden letters on a purple ground, the magical word THOROUGH." The same whimsical young gentleman always addresses his father as "Squire," and cultivates an extraordinary passion for game-preserving. Job Thornberry's "intelligence was as clear as ever, and his views on all subjects unchanged; but he was, like many other men, governed at home by his affections. He preferred the new arrangement, if his wife and family were contented, to a domestic system founded on his own principles, accompanied by a sullen or shrewish partner of his life, and rebellious offspring." The son's name "Hampden" is perhaps unconsciously suggested by the residence of the Thornberrys at Hurtley, which is identified by description with Great Hampden, an historical house and small hamlet not far from Hughenden. Job's domestic philosophy is an additional illustration of the doctrine of the supremacy of personal motives and influence. From the same village of Hurtley comes the Rev. Nigel Penruddock, who afterwards, as Cardinal Penruddock, perpetrates the notorious Papal Aggression. It was perhaps hardly worth while to execute an inferior copy of the Cardinal Grandison of *Lothair*. Scarcely any attempt is made to distinguish Lord Roehampton from Lord Palmerston except in the details of private life. In the Ministry of Lord Melbourne Lord Roehampton is Foreign Secretary, and in that capacity he projects and executes the Syrian Expedition of 1840. Lord Beaconsfield regards with admiration, and almost with tenderness, the statesman whom he long opposed with untiring energy, but always with chivalrous courtesy. In accordance with his uniform practice, he disregards political differences which were, in fact, purely conventional. It pleases him to imagine the influence of such a character over a wife much younger than himself, who had originally accepted his hand for reasons of convenience, and especially in the hope of serving her twin brother Endymion. After mourning the death of Lord Roehampton, Myra, for the same reason, consents to marry the crowned adventurer who had, as Prince Florestan, long admired her during his exile in England. The character of Louis Napoleon's counterpart is carefully and skilfully drawn. He first appears as a boy entrusted to the care of Mr. Sidney Wilton by his mother, Queen Hortense, who is introduced under the ill-omened name of Agrippina. His English guardian renounces his acquaintance when he breaks his parole in a second attempt to recover his throne. His final attainment of his object is accomplished after the fashion, not of the third, but of the first Napoleon. His ambiguous position in England, his real or professed belief in destiny, and his resolute use of opportunities, are happily described. Those whose consciences are perverted or troubled by Lord Beaconsfield's animated pictures of social and political life must be easily demoralized. To amuse and interest thousands of readers by fanciful traits and ostensible revelations of a varied experience is not a mischievous or immoral achievement. It is pleasant to find that a statesman driven from the highest position in England has had at an advanced age sufficient elasticity of spirit and freshness of mind to write the most popular book of the year. Sir Robert Walpole in similar circumstances lamented that he had never learned to amuse himself by reading. It never occurred to him to regret the want of the more interesting occupation of writing. It is hardly worth while to discuss the question whether *Endymion* displays the literary power of *Tancred*. The work fully maintains the level of *Lothair*. Lord Beaconsfield's gift of delicate satire is well illustrated in his appreciation of the prejudiced dogmatism of political fine ladies. Zenobia, who is the Lady Jersey of fifty years ago, is firmly convinced that the Whigs have no chance of success in their contest with the King and the Duke. If she had been born in a lower rank half a century later, she might without modification of character have made speeches on platforms as a strong-minded woman. The Count of Ferrol, who is identified with a living statesman only by his use of the phrase "blood and iron," has little or nothing of Zenobia's dramatic truth of character.

MR. TENNYSON'S NEW VOLUME.*

MR. TENNYSON'S latest volume has the advantage of containing in a small compass food for widely varied tastes. There are two poems in the style of *The Northern Farmer*, one of which, "The Northern Cobbler," strikes us as admirable; there is, besides the republished "Revenge" and "Defence of Lucknow," a singularly stirring and ringing poem called "The Voyage of Maeldune," founded on an old legend of St. Brandan's Isle; and, to pass over other pieces to be presently noticed in detail, there are four sonnets, one of which sums up in terse and beautiful style the leading characteristics which endeared the late Mr. Brookfield to all who had the privilege of knowing him.

The volume opens with "The First Quarrel," a story told by a woman in the Isle of Wight to the doctor who is attending her sick boy. There is an odd touch in the first few lines:—

> "Wait a little," you say, "you are sure it'll all come right."
> But the boy was born i' trouble, an' looks so wan an' so white:
> Wait! an' once I ha' waited—I hadn't to wait for long.
> Now I wait, wait, wait for Harry.—No, no, you are doing me wrong!
> Harry and I were married; the boy can hold up his head,
> The boy was born in wedlock, but after my man was dead;
>
> I ha' worked for him fifteen years, an' I work an' I wait to the end.
> I am all alone in the world, an' you are my only friend.

The Doctor's groundless suspicion seems to want some further explanation than is to be found in the fact that wrong rhymes to long, especially as it has no kind of bearing on what follows. Nelly, the widow, goes on to tell with much simplicity and tenderness the story of Harry's early courtship, of how he went away for years, bound to a farmer in Dorsetshire, where, unfortunately, "there was a girl, a hussy, that worked with him up at the farm," of how Nelly waited faithfully and lovingly for his return, and of how they were married on Christmas Day, and

> Those were the pleasant times, my house an' my man were my pride,
> We seem'd like ships i' the Channel a-sailing with wind an' tide.

But, work being scant in the Island, Harry went over the Solent, and wrote to his wife that he had taken a six weeks' engagement, and would cross again to say good-by to her. On this she puts the house in order, and in clearing out an old deal box comes upon a letter written to Harry when he was in Dorsetshire by "the hussy up at the farm." The scene which follows between the two is described with admirable truth, and the husband's character is capitally brought out in the few speeches, every word of which the widow remembers. The end of it is that she refuses to kiss him before he goes, and that she gets a letter from him saying that he has got six weeks' work in Jersey, and is going over in the boat:—

> An' the wind began to rise, an' I thought of him out at sea,
> An' I felt I had been to blame; he was always kind to me.
> "Wait a little, my lass, I am sure it 'll all come right"—
> An' the boat went down that night—the boat went down that night.

"Rizpah," the following piece, written in the same metre, has a yet more tragic theme, and it may be doubted whether the form in which it is cast is in the nature of things particularly well fitted to the matter. It is, however, full of fine touches of feeling and character, and leaves a strong impression. A dying woman tells a lady who is visiting her how her son Willy, being dared to the feat by his wild mates, robbed the mail, took one purse, with the contents of which he refused to meddle, and was hanged for the deed. There are great pathos and power in the description of her last meeting with him, and in her tale of her subsequent insanity, and of her secretly burying his bones in holy ground. It would be impossible to do full justice to the fine qualities of the work except by copious quotation, and even this would be difficult, since each passage is closely connected with what goes before and follows it. In "The Northern Cobbler," which follows this, both the idea and the execution seem to us as good as they can be. The cobbler is a reformed drunkard, who has hit upon an original method of overcoming his enemy by buying a large bottle of gin and keeping it with the cork undrawn constantly in his window, and the return of his sailor brother-in-law is made the occasion for his telling the story of his courtship and marriage, of his decline into habits of drunkenness, and of his final victory. There is hardly a line in the poem which has not some strong or happy turn of expression, and both the narrator and the events he narrates are brought

* *Ballads and other Poems.* By Alfred Tennyson. London: C. Kegan Paul. 1880.

before us with singular vividness. There is an admirable passage which relates how one night he came home worse than usual, "like a bull gotten loose at a faäir," how he "knaw'd naw moor what I did nor a mortal beäst o' the feäld," and how, waking in the morning, and seeing the hideous disorder he had caused, he remembered the days of his courtship, and the first kiss he gave his wife, as they looked after a lark that was "singin' 'is best of a Sunday at murn."

> "Doesn't tha see 'im," she axes, "fur I can see 'im?" an' I
> Seeäd nobbut the smile o' the sun as danced in 'er pratty blue eye;
> An' I says "I mun gie tha a kiss," an' Sally says "Noä, thou moänt,"
> But I gied 'er a kiss, an' then anoother, an' Sally says "doänt!"
> An' when we coom'd into Meeätin', at fust she wur all in a tew,
> But, arter, we sing'd the 'ymn togither like birds on a beugh;
> An' Muggins 'e preäch'd o' Hell-fire an' the loov o' God fur men,
> An' then upo' coomin' awaäy Sally gied me a kiss ov 'ersen.

"The Village Wife; or, the Entail," another piece written—far less happily, as it seems to us—in the same dialect and metre, is judiciously separated from "The Northern Cobbler" in the volume by "The Revenge" and "The Sisters." Of the splendid swing and spirit of the already familiar "Revenge" it is perhaps hardly necessary to speak. The magnificent directness of the story, the martial power of the lines, the daring in their management which only a master of metre can employ with success, and the indefinable spirit of the whole thing, will not have been easily forgotten by readers who have already become acquainted with the work. It is followed by one which is, to our thinking, with one notable exception, the weakest production in the volume. "The Sisters" strikes us as a story which is at once commonplace and disagreeable, and it is related in verse that never rises above the level of smoothness and carefulness, or, in other words, above a level which any verse-writer possessed of practice and of a good ear can attain. There is, it is to be feared, nothing very out of the way in the supposition that a young man may propose, for all practical purposes, to marry a young woman, and may afterwards fall in love with, propose to marry, and actually marry, this young woman's sister. We have, indeed, seen this simple and not very attractive plot form the substance of a decently written magazine story. The least that could be expected of Mr. Tennyson, if he chooses to take up so barren and ungrateful a theme, is that he should give it some touch of exaltation. Possibly by some of his readers he may be judged to have done this. For our own part, we must confess that "The Sisters" seems to bring out in strong, if undesigned, relief the odious character of the man who is at once the chief figure in, and the narrator of, an unpleasant tale, and fails to give due weight and interest to the character of the girl who has sacrificed herself to this poor creature's meanness. It may be added that in this case Mr. Tennyson's vehicle for his story is not particularly happy. The man who was capable of the gross act of jilting, the story of which is the substance of the poem, might also be capable of the strange indiscretion of relating his own fault to a youth whose affections hover between the two sisters born of the narrator's unpraiseworthy marriage. We were about to add that the tale would not prepossess the youth in favour of his possible father-in-law. But perhaps Mr. Tennyson has intended to extend the old proverb to "Like father-in-law, like son-in-law." If so, we cannot think it fortunate from any point of view that the intention has been executed.

Of "The Village Wife," which follows "The Sisters," we need say no more than we have already said; and of "In the Children's Hospital" we can only say that it is written with Mr. Tennyson's accustomed command of language and metre, and that, while some people will no doubt find its sentiments charming, others may possibly think them a trifle maudlin. One passage in it, however, ought to live. It may be based on a too hasty generalization, but experience goes to show that abuses of the kind aimed at can be met only by what in other cases might be called illegitimate warfare. The speaker is a hospital nurse, who thinks, from her cursory view of a new doctor, that he is one who could "mangle the living dog that had loved him and fawned at his knee—Drench'd with the hellish oorali—that ever such things should be!" This is not a fit occasion for dwelling on the terribly difficult question of vivisection; but it may be said that no one possessing any human, which generally includes "animal," sympathy is likely to think the epithet which the Laureate has applied to a particular phase of the matter one whit too strong.

The piece just dwelt on is followed by the beautiful "Dedicatory Poem to the Princess Alice," and by the "Defence of Lucknow," which seems to us only second, if second, in fire and splendour of verse to "The Revenge." For these two poems we have nothing but admiration. Passing over two pieces—"Sir John Oldcastle" and "Columbus," which appear to us comparatively uninteresting—we come to "The Voyage of the Maeldune," a work already referred to, and one which shows, more than any other new publication in the volume, except perhaps "The Northern Cobbler," the continuing freshness of the poet's fancy and power of expression. In this it seems to us that Mr. Tennyson has caught and rendered with complete success both the simplicity and the strength demanded by the subject. The swing of the verse alone carries the reader away, but when he reads, as he is sure to read, the poem again, he finds that what seems the over-mastering spontaneousness of the writing, is in fact the result of the completest art. Each one of the fabulous isles at which the mariners touch is described with extraordinary vividness and beauty, and the metre is admirably suited to the subject. As Mr. Tennyson has managed it, it helps in a marked degree that sense of whirling and constant change of scene and adventure with which the poem is instinct, and the whole result of which is arrived at by innumerable touches that readers will discover for themselves. The end of the work is, as it seems to us, altogether admirable, both in conception and in form.

After reading and commenting upon this fine work, it is matter for regret to us, as it probably will be to all who are not absolutely indiscriminate admirers of anything to which Mr. Tennyson chooses to put his name, to have to record the fact that he has included in this volume the extraordinarily incoherent and meaningless stuff to which he has given the names of "De Profundis" and "The Human Cry." "De Profundis" is unpleasant and dull; "The Human Cry" is a collection of "words, words, words," which it is astonishing that any one should have set down in print. We may close our notice of a volume of curiously mixed merit by a reference to the singularly touching and pretty dedication prefixed to the book.

BURKE'S HISTORICAL PORTRAITS.*

WE owe it to Mr. Hubert Burke, a few hours with whose new volume have affected us something like a journey in a springless waggon over a clay soil in the month of November, to make mention of an encomium of his book which must have fully compensated him for the superficial judgments of the indolent or shallow reviewers to whom, more in sorrow than in anger, his preface refers. No less a personage than Mr. Gladstone has written to the author to state that he has "read every page of the work with great interest," and that he "subscribes without hesitation to the eulogy passed on it by the *Daily Chronicle*, as marking, *as far as he knows*"—the italics are, we suppose, the publisher's—"*a distinct and valuable addition to our knowledge of a remarkable period.*" After this, anything we can say becomes indeed of vanishing importance; but we must say it nevertheless. Instead of taking warning by the comments which the first volume of these so-called "Historical Portraits" inevitably elicited, even from those who like ourselves were willing to acknowledge in Mr. Burke a love of truth such as happily may at times coexist with a grievous habit of blundering, he has put forth another large volume not less pretentious, and, if anything, more grotesque, than its predecessor. So incorrigible an offender—for the present work does not represent the first-fruits of its author's studies—needs to be reminded once more that a book of this kind is an indignity to historical literature. The best-intentioned actor, though he might have formed a highly ingenious and perfectly novel conception of Hamlet, would be hissed off the stage if the audience, to use a vulgar phrase, could not make head or tail of his delivery of the speeches set down for him. Mr. Burke seems to write with the fixed purpose of illustrating by a *reductio ad absurdum* the profound discovery recently announced to the world, that the science of history has nothing to do with the art of composition.

A few quotations must, we fear, be given from what Mr. Burke might call a "sadly ample" collection, in order to exemplify the kind of pabulum which it would appear some digestive systems are strong enough to assimilate. Mr. Burke's vagaries of style are of many kinds and of many degrees, and it is not perhaps so very often that he passes the line which distinguishes the distressingly from the utterly obscure. Mr. Froude may, for instance, guess at the meaning of the following challenge, though his engagements may prevent him from repairing to the literary Canossa to which it invites him:—

> How and when arose the startling changes from light to darkness? Where is the record of that universal corruption which, even on the fringe of the Middle Ages, was alleged against those sacred houses? Even Mr. Froude must acknowledge that the Catholic Church, chiefly through the monastic houses, had been the sole focus of intelligence; and he owes it to his credulous and much-abused following to point out the era of change from the sanctity and devotion he here so eloquently depicts to the dire wickedness which so shocked the hearts of the Inquisitors he has so much bepraised.

On the other hand, in whatever spirit the following expression of homage may be received by Mr. Freeman—"one of the most researchful and conscientious historians of the present day—one who has sought for truth, without capricious breaks of oblivious spleen, in his reliable writings" (Mr. Freeman's *reliable* writings!)—its significance must remain doubtful to the warmest of his admirers:—

> To do justice to a bishop or monk, adds Mr. Freeman, is just what Mr. Froude can never bring himself to do. Yet Mr. Freeman is said to belong (I know not otherwise) to a belief more hostile to the olden worship of England than that professed by the autocratic object of his criticism. But Mr. Freeman *will* have history, not rhetoric or imagery. And thus should history be written. Will the equity of all future hearts respond? It is a sacred duty to do so.

But neither Mr. Freeman, nor Mr. Froude, nor any other person versed in the study of English history, could perform the part of Œdipus to the enigma of the following sentence, apparently intended to impress upon the reader the fact, previously stated, that in the Tudor days an iron discipline prevailed in the Tower of London:—

> Over the Thames for many a long year could have been heard the sounds of mourning and sorrow to rival those which were borne over the lagunes

* *Historical Portraits of the Tudor Dynasty and the Reformation Period.* By S. Hubert Burke. Vol. II. London: John Hodges. 1880.

of Venice, and the Lion of England was as dangerous a recipient of accusations as the Lion of St. Mark, though he opened not his literary jaws so widely to the gaze of apprehensive citizens.

The defectiveness of Mr. Burke's grammar our readers will, we imagine, be content to take on trust; nor need we dwell on the carelessness of an orthography in which the well-known diplomatist appears as Wutton, the celebrated divine as Œcolompadius, and the great poet as Spencer. Even Mr. Pettie, R.A., becomes "the eminent painter, Bettie," which, considering the praise bestowed upon his telling of a "grim prose story in painted verse," is rather hard upon "one of the greatest of English painters." Lord Seymour of *Sudbury* we are inclined to regard as merely an ingenious misprint.

To such small vexations as these Mr. Burke had done his best to accustom us in the first volume of his "Historical Portraits," and he maintains a similar self-consistency in his practice with regard to quotations. In order, perhaps, to diminish the number of inverted commas which stud his text as the silver nails studded the sword of Agamemnon, he occasionally begins a sentence as a quotation, and finishes it, to all appearance, as an original remark. On the other hand, he reserves to himself a general liberty of modernizing the language of the anecdotes which he owes to his research. Thus, for instance, Henry VIII. is made to say to Archbishop Cranmer, on his promising "King Hal" a dish of jack for supper, "That will do nicely." Elsewhere we are overwhelmed by a mass of authorities such as would almost suffice to establish as a fact the most startling paradox, in confirmation of two queer, though very possibly not groundless, bits of scandal about the Princess Elizabeth and Sir Thomas Seymour, to the recital of one of which Mr. Burke appends a reference to

> Haynes' State Papers; Ellis's Royal Letters; Tytler's Edward and Mary; Miss Strickland's Queens of England, Vol. V.; Lingard, Vol. V.

"Fuller, Collier, Heylin, and Ranke" are summoned to support a few lines in a previous note concerning Cranmer's office of "Penitentiary-General of England"; though to be sure, in a passage in the text, "Leopold Rancke" is quoted by himself. We might have thought the familiarity implied in the use of the Christian name a mark of confidence similar to that bestowed upon "Henry Hallam," though unfortunately the latter is elsewhere appealed to, with *Anthony Wood* and other writers "of high repute," in testimony of the correctness of a statement of detail. But, inasmuch as "Gilbert Burnet" is mentioned with the utmost scorn, it is clear that the introduction of the Christian name may serve a double purpose, such as we believe it is wont to serve in cheap fiction. Much uncertainty seems to surround a reference to "Macaulay's Essays on the English Reformation"; the passage is, however, taken from the essay on Hallam's *Constitutional History*, not from that on the Life of Burleigh by Dr. Nares (whom Mr. Burke of course calls Dr. Naro). While on the subject of quotations, we may point out a curious discovery which, to use a phrase of Mr. Burke's, "speaks volumes" for the wickedness of "the men of the time," and also for the sterility of their inventiveness in the matter of death-bed rhetoric. Dr. Layton, or Leyton, well known as an unscrupulous (though perhaps not the most utterly ruthless) member of Cromwell's Commission for the visitation of the monasteries, came to a bad end:—

> Thorndale, who was well acquainted with Layton, saw him two hours before his death, when he addressed him in these words:—"Beware of my fate—you now see the death-bed of a bad priest; I served my King truly, but not my God." *All is lost* were his last words.

If Leyton in his last moments thus conveyed the famous words which, according to Cavendish, were used by Wolsey to the judges sent down to him at Esher, King Henry VIII. himself borrowed the dying words of the repentant Inquisitor:—

> A death-bed has been described as the altar of forgiveness, where charity and tears commingle as the spirit of prayer communes. These attributes were absent from the dying couch of Henry Tudor, whose last despairing words, chronicled by Anthony Denny, "All is lost!" express an awful consciousness of the retribution due to a wicked and truculent career.

"And yet," as the ballad about the burning of the Globe Theatre on the occasion of the performance of *Henry VIII.* had it, "all this is true"; for the narrative given by Mr. Burke of the last moments of the bloodthirsty King is corroborated by a comprehensive reference to "Leti, Thenet, Harpsfield, Godwin, Burnet, Rapin, Macintosh, Tytler, and Lingard."

We wish we could have added that Mr. Burke, who handles his materials after a fashion which we have by this time sufficiently exemplified, at least displayed that modesty which would so well become an author who writes like a novice. Not only, however, does he criticize earlier and more generally appreciated historians with a freedom which perhaps he could not always have avoided; but he goes out of his way to venture on the following critical note, which he must excuse us for designating as, in more senses than one, impertinent:—

> The present Poet-Laureate, in one of those hard-wrought operations of the brain which tax equally the performer and peruser, has familiarized the few who can understand him with his notions on "the holy grail. *Omne ignotum pro magnifico.*"

Even more gratuitously silly is the sneer implied in the observations, *à propos* of the unlucky Mrs. Cranmer, that "even a German girl of seventeen might have, in more recent times, hesitated to become the clandestine wife of a man nearly fifty years of age"; but that since, according to Dr. Hook, Mrs. Cranmer was not a woman of "much refinement," we must suppose her to have adopted the situation, "which, in Teutonic notions, may have been passably satisfactory." Clearly Mr. Burke's own "notions" about things Teutonic are in the last degree uncertain; for, after speaking of Anne of Cleves as a "Dutch princess," he complacently repeats, at intervals of two or three pages, the statements that "she could read no language but Plats-Deutsch or Flemish," and that her own language was an "involved Walloon." As Mr. Burke appears to subscribe to both these pieces of linguistic information, he should have traced to its origin the verbal form employed by Anne in a saying of hers which he likewise cites:—"There is no place like this England for fodein righte well."

We do not think that we have been guilty of an injustice either to Mr. Burke or to the cause which we claim to have at heart as much as he has, when we demur to his pleadings on a very different issue from that on which he tries conclusions with the historians whom he criticizes. We believe him to be an honest as well as an industrious student; and it is pleasant to find a writer to whom John Knox is a "fanatic, perhaps lunatic agitator," and who makes no secret of the bias which inclines him, coming so near to the mark as he seems to us to do in his estimate of the Catholic party in Queen Mary's reign. Indeed Mr. Burke's impartiality is of the broadest kind; the Peers and Commons of Queen Mary's reign in general were, in his opinion, as dishonest and corrupt as those who preceded them under her brother and her father. As for the populace in those sad times, nothing, as he holds, could exceed its dishonesty and inconsistency; though a portion of it might stand excused by circumstances. This seems to result from his description of certain old women who were punished for railing against Queen Mary. They were (like John Knox) "either fanatics or lunatics, for the religious frenzy had created many boisterous idiots." If we cannot always accept Mr. Burke's judgment of the leading Reformers, "many" of whom he rather rashly supposes to be included in the censure of Queen Catharine Parr, it is at least never the judgment of an uninstructed partisan. His sarcasms occasionally suggest the preliminary query—*Quis provocavit?* What "writers of the present day," for instance, are in the habit of describing Henry VIII. as "gentle and merciful," "a model of married life," &c.? Is it only students of the numerous and more or less recondite authorities cited in this book who have some idea of the tyranny of "Lord Crumwell" (as Mr. Burke has "elected" to call him)? or is a sufficiently distinct picture drawn of his system in a history which is in every one's hands like that of Mr. J. R. Green? If Mr. Burke had occasionally asked himself such questions as these, he might have considerably lightened his "congeries of arguments, supplemented by eloquence"—to apply his description of Gardiner's sermon before King Edward. He might thus have gained time for arranging more skilfully his attack upon Cranmer, the idol on whose behalf Mr. Froude "entered the field, assegai in hand"; and for giving effectiveness to his chapters concerning Somerset, whose historical portrait was really worth repainting.

ARMY LIFE IN RUSSIA.*

JUDGING by his books, we should say that Mr. Greene is one of the best specimens of that modern school of officers who are at once enthusiastic and highly educated. His former volume on the Russo-Turkish war commanded general approval by the brilliancy and lucidity of its style, as well as by the value of the information which it conveyed with the precision of scientific knowledge. His present work is in a measure supplementary to the previous one, but it is not less interesting, and scarcely less valuable. It gives sparkling sketches, not merely of life in the army, as its title professes, but of the various orders of Russian society, from the Czar himself down to the humblest of his subjects. And the author returns to the seat of the war, describing some of the most momentous and stirring events of the campaign—such as Gourko's passage of the Balkans, the sanguinary assaults on the works at Plevna, and the three days' hard fighting in front of Sophia, when the Turks were making their last stand against odds that became at last overwhelming. Mr. Greene is no holiday correspondent who got up his picturesque facts at secondhand, compiling his narrative in the rear of the columns by the help of telegrams and a lively imagination. When it was in any waypossible, he was always at the front, and frequently exposed himself under the hottest fire, without the hope of either glory or substantial advantage. He tells a straightforward, soldier-like story, and it is only by incidental notices of his confidential intercourse with the Russian leaders that we appreciate the consideration in which he was held by them. That he is predisposed in favour of the Russians is but natural, after all the toils and dangers he had shared with them; and the generous hospitality they showed him on all occasions must have awakened a warmer sentiment than mere gratitude. Yet he does not hesitate to exhibit the frankness of a friend in showing the weak points in their military system; and even in the lifelike portraits of their most conspicuous generals he gives proof of courage as well as of candour.

The volume opens appropriately with a chapter on the Czar. In the beginning of August 1877 Mr. Greene had reached the little Bulgarian village of Biela. He drew bridle before the temporary

* *Sketches of Army Life in Russia.* By F. O. Greene, Lieutenant of Engineers, U. S. Army, Author of "The Russian Army and its Campaigns in Turkey in 1877–78." London: Allen & Co. 1880.

field-quarters where the Emperor was housed in a couple of officers' tents joined together. The American arrived just in time for dinner, and would gladly have brushed himself and washed off the dust before the ceremony of formal presentation to the autocrat. But the aide-de-camp who received him assured him that that was quite unnecessary. The arrival of staff messengers in even less presentable case than himself was a matter of everyday occurrence. The dinner was substantial, though simple; but it was served upon silver-plate by richly-liveried servants, and about eighty guests had been invited to the party. Distinguished statesmen and officers were present; but Mr. Greene's attention was naturally attracted to his Imperial host, who sat almost immediately opposite to him. The Czar assumed a cheerful manner, conversing freely with those near him; but "even a casual observer could detect the weight of care and responsibility which seemed to rest so heavily upon him." He felt the misfortunes he could not avert and the sufferings he could not alleviate. "The expression of his face grew still sadder as the summer and autumn wore on, and Plevna held fast, and he gradually lost flesh—more than thirty pounds—giving him a gaunt look." Mr. Greene believes thoroughly in the Czar's good intentions; but, indeed, he goes so far as to persevere in the theory that Russia entered the campaign of liberation from philanthropic rather than ambitious motives. He pities the Czar as a man who has been the lifelong victim of his own irrepressible benevolence and exceptionally advanced ideas. Alexander has undertaken a series of labours almost beyond the strength of even an autocrat like himself. He began his reign by liberating the serfs, and consequently alienating the nobles; nor has the injury he did to vested rights and to the landed proprietors been ever forgiven him by those whom it impoverished. And now, placed high above classes who do not sympathize with him, he is "attempting the Herculean task of dragging eighty millions of people forward, rather against their will than with their assistance." No wonder that the strain of sustained effort has proved too much for a man whose motives and purposes are systematically misconstrued. And, moreover, he lives in the perpetual apprehension of assassination by the people he has been striving to benefit. Still, serious though the danger from secret conspirators may be, Mr. Greene insists that the leaven of disloyalty has diffused itself through but an infinitesimal portion of the nation. The rank and file of the army who represent the masses of the nation believe in the divinity of the Czar as reverently as ever. However much they may have to endure in the field, they take it patiently, believing that he would feel for them and help them were their sufferings brought to his notice. Nothing impressed Mr. Greene more than a scene he witnessed after the disastrous engagement of Gorni-Dubnik, when the Emperor had ridden over to General Gourko's headquarters to pass the *corps d'armée* in review. He rode down the lines, exchanging words with some of the officers, and distributing crosses in the ranks:—

Studying their intent expressions, one got some insight into the thoughts of these simple, faithful-minded creatures, and saw that it still was possible in this sceptical age for men to look up to another man with personal adoration. In a moment they seemed to forget every one else but the Czar who actually was before them in the flesh. Their expression was not so much one of joy as of wondering veneration.

Mr. Greene confirms the generally received idea of the Russian soldier both as to his good qualities and defects. He "is strong in the staying qualities and weak in the vivacious ones." He has great tenacity and endurance, but very little *élan*. He has neither capacity of initiative nor self-reliance. It is but slowly and by deadly experience that he learns the elementary principles of his business, such as taking advantage of any point of shelter when moving forward against the enemy in open order. But he goes into battle with genuine enthusiasm, and is slow to realize when he is beaten and must retreat. There is nothing more vividly painful in the volume than the account of one of the unsuccessful attempts at storming the Plevna works, as witnessed by the author. It was the bloody assault of September 11th. It had been undertaken rashly and precipitately; for, after three days of incessant bombardment, no material damage had been done. Nothing could be more depressing than the weather. A cold rain had been falling incessantly for hours before, drenching the troops to the skin, and turning the slopes of grass into morasses. Nevertheless, as all the arrangements had been made, it was resolved that they should be carried out. What Mr. Greene witnessed was a front attack, over a broad extent of ground broken by one ravine. The column consisted of five thousand men. When the assailants were within twelve hundred yards of the enemy's redoubts the defenders began to open fire. Thenceforward the volleys from the earthworks were incessant. The Russians kept moving forward, steadily, but terribly slowly as it seemed to the onlookers, till the Russian batteries had to cease firing, in the apprehension of sending the shot among their friends. "Finally the line of Russians seemed to be within only one hundred or two hundred yards of the redoubt; the line could be seen to break into a run, and then all was lost in a confused mass of smoke, through which the fire from the muzzles leaped back and forth from end to end of the parapet, like flashes of lightning." Nothing could be distinguished through the smoke, and the onlookers held their breaths in painful suspense. Next black dots were seen to emerge, to be followed by the whole line scattering in confusion, and falling back towards the rear. "Now the fire of the Turks seemed to increase with the fury of hell itself"; and then the Turks made a dash to follow up their victory, till the Russians, throwing themselves in line upon the ground, repulsed them in turn with their volleys. Nothing could show more conclusively the steadiness of the soldiery, but no troops are more absolutely dependent on good leading. And Mr. Greene shows his frankness in the opinion he pronounces on the officers. Those of the regiments of the Guards and the crack corps usually in garrison in St. Petersburg are men of birth and breeding, and of showy, though superficial, education. But among the rest of the 25,000 who are taken from the middle classes of a population whose education has been unusually backward, it is "difficult to find enough men possessing what we are accustomed to look upon as the necessary qualifications." In unfamiliar situations they are all abroad, and nothing demonstrated this more painfully than the want of all preparations when the long-expected surrender of Plevna had come off. Forty thousand miserable prisoners were thrown upon their hands in the depth of winter; and "no better expedient presents itself than to herd them out in the snow in great flocks like sheep, and let three days pass before they get anything to eat." There had been no intention of deliberate cruelty, but the suffering among the victims was intense and the mortality enormous.

The best of Mr. Greene's portraits of Russian generals is that of Skobeleff, perhaps because the subject of it is the most striking. Skobeleff, though well connected and born wealthy, is in many respects a self-made man, and something more. In an Empire where good appointments go by favour, and where subserviency to superiors and general toleration of abuses are the secret of rising quickly, whether in the army or the civil service, he showed himself aggressively independent. He made himself influential enemies among all classes, and when he had been calumniated by charges of gross corruption, he actually ventured to treat with disrespect the Court official entrusted with the inquiry. He established his innocence by irrefragable proofs, but characteristically he was made to pay the penalty of the sins of which he had been falsely accused. When the war broke out he was under a cloud, and, though a major-general, had with difficulty obtained permission to serve as a volunteer in the quality of aide-de-camp to an officer of rank scarcely superior to his own. By almost harebrained gallantry, and by promptly improving each opportunity that offered, he forced his way to the front. At Lovtcha he distinguished himself so brilliantly as to be named by the Grand Duke Nicholas, in his telegram, as the hero of the day. Before Plevna he received the command of the troops forming the left attack; and, though in one of the bloody repulses from the redoubts he lost 8,000 out of his 18,000 men, he received credit for having done his utmost, where failure, as it proved, was a foregone conclusion. The next day he was gazetted Lieutenant-General, and appointed to a division, being only thirty-two years of age. Yet in that high command he made it a point of honour to expose his life as recklessly as when a subaltern. He rode a white horse and wore a white uniform; and would cross the most formidable country at a gallop, leaving his staff to follow over the fences as they could. "It was intended to impress his men, and it did so." They came to believe him invulnerable; while he, on his side, never hesitated to order them to run the hazards which he was perpetually risking himself. These are the qualities that might make a dashing leader of irregulars; but Mr. Greene, after familiar acquaintance, with many opportunities of observing him in the field, deliberately credits Skobeleff with "stupendous military genius." "I firmly believe that, should he live twenty years more, he will be commander-in-chief in the next war about the Eastern question, and history will then speak of him as one of the five great soldiers of the century, side by side with Napoleon, Wellington, Grant, and Moltke." It may be said that, with Skobeleff's practice of risking his life, the odds are against his surviving, should he continue to see much service in the field. In the meantime we may anticipate that his talents, with his energy, will go far towards deciding in favour of Russia his coming campaign against the Tekké-Turkomans.

GOIRAND ON FRENCH COMMERCIAL LAW.*

WHENEVER the question of codification is discussed there are some people who talk so glibly of the French Codes that one might suppose they were matter of common knowledge in this country; whereas, in fact, save for information gleaned on the rare occasions when it becomes necessary to look up special provisions bearing on some case partly of French origin, or as furnishing illustrations of some principle of abstract jurisprudence, they are practically sealed books to the majority of English lawyers. M. Goirand has, however, put it within our power to verify the truth of the propositions in which he has embodied the French Commercial Code, by annexing to each proposition a reference to the particular article of the Code on which it is based, and by giving the complete text of the Code in the second portion of his work. Such would appear to be the fidelity with which he has expounded the Code that we have been unable to detect any discrepancies between its provisions and his commentary thereon; so that, beyond a general notice of the scheme of the book, our attention must chiefly be directed to the consideration of the more important points wherein the French system of commercial law differs from the English, and the comparison of their

* *The French Code of Commerce; with a Theoretical and Practical Commentary.* By Léopold Goirand, Licencié en Droit, Avoué au Tribunal Civil du Département de la Seine. London: Stevens & Sons. 1880.

respective merits. One cannot help being prepossessed in favour of M. Goirand's work by the modesty and diffidence with which in his preface he craves the indulgence of his English readers "for the Gallicisms in which it abounds"; adding, "It would have been presumption on my part to have attempted to write literary English. I shall be contented if, in spite of the French construction of its sentences, my work should turn out to be adequately intelligible." We are honestly able to reassure M. Goirand on this point. Whether it be owing to the supervision of the two English solicitors in Paris whose assistance he gratefully acknowledges, or whether it be that M. Goirand has formed too low an estimate of his capacities as a writer of English, it is certain that the Gallicisms in question are very few and slight, and that an Englishman, not previously informed to the contrary, might well read the whole book through and suppose it to be the work of a fellow-countryman.

M. Goirand begins his book with a short sketch of judicial organization in France, the machinery for civil procedure consisting of juges de paix, civil tribunals of first instance, courts of appeal, and the Court of Cassation or final appeal, with their attendant functionaries. Ancillary to these tribunals, there exist in many districts of France Tribunals of Commerce, elected from the members of the trading community and exercising jurisdiction in purely commercial matters; and also, but in fewer localities, "conseils de prud'hommes," or Arbitration Boards for the settlement of grievances between employers and employed. Incidentally we notice that in no case can imprisonment be awarded in France for non-payment of money, save where such payment is enjoined by way of damages in distinctly criminal proceedings.

The short treatise on procedure which M. Goirand embodies in his introductory chapter is perhaps too technical for much discussion here; it is, however, exceedingly interesting to persons conversant with the method prevailing in our own courts, affording many points of contrast as to which the advantage appears not to be all on one side. Such, for instance, are the varying and elastic rules as to limitation of actions according to their subject-matter, the admission of documentary evidence only in civil cases as distinguished from commercial suits, the absence of any power to compel a foreign plaintiff to give security for costs, the rule by which each party has, whatever be the result of the litigation, to bear the expense of his own counsel's fees, and so forth. In dealing with these preliminary matters M. Goirand occupies nearly fifty pages, and it is not till then that we fairly embark on the Code de Commerce, arranged, as he tells us, "in logical order and not in that adopted by the Legislature." M. Goirand's commentary being confessedly a paraphrase, it may be as well, however, to give some idea of what the Code of Commerce itself is, as reproduced textually in his book. It consists of 648 articles or sections, and, with some few supplementary enactments, embodies the whole of the law by which commercial transactions in France must be regulated and judged. It occupies, in fact, the same ground as that covered in this country by commercial common law, the equitable doctrines modifying that common law, the various statutes relating to partnerships, companies, negotiable instruments, merchant shipping, and a host of cognate subjects, to say nothing of customs of trade, and the crowd of judicial decisions which are constantly building up additions to the law-merchant. Decisions are of course recognized in French law, but they are all purely questions of interpretation, and the number which M. Goirand finds it necessary to cite is infinitely smaller than would be the case in an English text-book.

The first few articles of the Code, and likewise of M. Goirand's commentary, treat of the status, privileges, and liabilities of the trader; and we are here at once brought face to face with certain provisions unknown to the English law, and leading up to that French system of bankruptcy which is immeasurably superior to our own. As M. Goirand tells us at p. 52, "Traders are compelled by law to keep books. A trader who does not keep books, or who keeps them irregularly, cannot produce them in evidence, and renders himself liable to the penalties attaching to fraudulent bankruptcy." Three books are obligatory—the journal, the press copy letter-book, and the stock-book. All these books have to be kept in order of date, without blanks or additions, all the pages must be numbered and initialled, and the journal and stock-book are officially inspected and initialled once every year, so that fraud is well-nigh impossible. When we come to consider the French system of bankruptcy we shall see how important a part these obligatory books play in it; but, even apart from this, the provision we have mentioned is a salutary, if a somewhat officious, regulation, tending to promote order and care in commercial undertakings, and the use of the books in evidence which is thereby rendered possible must effect an appreciable saving of judicial time. From trades the transition is natural to partnerships and companies, both included in French law under the common term "sociétés"—the distinction being marked by the addition of descriptive words, such as "sociétés en nom collectif," or ordinary partnerships; "sociétés en commandite simple," or partnerships including sleeping partners liable only to the extent of their interests, which are non-transferable and evidenced by the partnership deed; "sociétés en commandite par actions," wherein the rights of the sleeping partners are established or evidenced by transferable shares; and "sociétés anonymes," which precisely correspond to our joint-stock Companies, limited. With regard to the last-named and most important class, divers wholesome restrictions exist, the counterpart of which might with advantage be introduced into English law. Thus, in order to protect small investors, always the most gullible class, it is provided that no share shall be less than 100 francs where the capital does not exceed 200,000 francs, or less than 500 francs in any other case. Then Companies divided into shares are not definitively constituted or recognized until the whole of the capital has been subscribed, and one-fourth must be paid up at once by every shareholder on taking up his shares. Further, if promoters or other members bring in an equivalent in kind for shares in lieu of full money payment, such arrangement must be approved at the first general meeting of shareholders. The issuing of fraudulent prospectuses and the declaration of fictitious dividends are provided against by enactments at least as stringent as those of our own law. At p. 91 M. Goirand gives us a synopsis of the French law as to Co-operative Societies, or "sociétés à capital variable," the organization of which is regulated by a law passed in 1867. From what he says, we gather that Co-operative Societies, including Stores, Benefit and Loan Societies, have not met with the same favour and acceptance in France that they have in England. At p. 112 we come upon a short chapter relating to "the judicial separation of property between husband and wife," as to which it is not very clear what place it has in a Code of Commerce. As, however, the text of the Code includes provisions on this head, we do not see how M. Goirand could have omitted it.

Chapter V. treats of the Bourse, stockbrokers, and bankers, and contains much valuable information as to these important members of the French commercial community. It is somewhat surprising to learn that there are only sixty stockbrokers in Paris, who enjoy a monopoly of carrying out negotiations in public and other securities and dealing in commercial paper. These favoured few are, however, subject to liabilities commensurate with their privileges. For instance, a French stockbroker is theoretically liable to imprisonment for a term varying from one to twelve months, and a fine of from 500 to 10,000 francs, if he lends his services for speculations in any securities whatsoever; but, as might be expected, and as M. Goirand takes care to inform us in a note (p. 125), "this provision of the law is never applied by the Courts." Time-bargains seem to be definitely recognized on the French Stock Exchange, unless they assume the character of purely gambling transactions, so that the law would appear to be practically the same as in this country. The French law as to carriers appears pretty nearly identical with the English, with this important exception that, according to M. Goirand (p. 167), the carrier cannot free himself in advance by a formal stipulation from the responsibility which the law casts on him. However much the freedom of contract on the part of carriers in this country has been restricted by the Canal and Railway Traffic Act, and the judicial interpretation which has been put thereon, English carriers are in a far more favourable position.

Bills of exchange and promissory notes constitute too large a part of any legal commercial system to allow of our here treating in detail of the French law relating to them as expounded by M. Goirand. Moreover, negotiable securities have so international a circulation that the systems of various countries have to a certain extent become conformed to one another. Certain distinctive provisions, however, exist in French law which seem to call for a passing notice. Such, for instance, are those by which bills of exchange must be drawn in a place other than that in which they are payable; by which the holder of a dishonoured bill may, with the leave of a judge, provisionally seize the property of persons liable thereon; by which a bill at sight must be presented within three months; by which the consideration for each endorsement must appear on the bill; by which a promissory note can only be made payable to order, and so forth.

The law of merchant shipping, which is fully treated by M. Goirand, we pass over without mention, in order to come to the very important topic of bankruptcy. The contemplation of well-nigh any foreign system of bankruptcy leaves one wrapped in astonishment at the supineness which has for eleven years permitted this country to labour under the mass of blunders which passes muster with us as a code of bankruptcy law. Of its faults we have spoken on different occasions until we are fairly tired; we will now only draw attention to a few of the points in which the merit of the French system is conspicuous. In the first place, only traders can be bankrupts in France. There may be arguments against this restriction; but, on the whole, it would seem to be an advisable one. Persons not traders who become bankrupt usually become so through extravagance or speculation, and it is not a bad thing to check the tendency to those follies by leaving persons who indulge in them to the tender mercies of their creditors. A French trader who suspends payment may be adjudicated bankrupt on his own petition, or on that of a creditor, or by the Court itself *proprio motu*. The pseudo-respectable device of a petition for liquidation is happily unknown in France. Simultaneously with the adjudication of bankruptcy, the whole administration of the bankrupt's estate is entrusted to certain syndics or trustees appointed by the court. The creditors may at a general meeting appoint new syndics, but the court is in no way bound by the selection, unless it meets with its approval. A juge-commissaire is also appointed, who is to adjudicate on any complaints lodged against the syndics, with an appeal to the Tribunal de Commerce. The Ministère public takes cognizance of all bankruptcy proceedings, and the final supervision rests with the Tribunal de Commerce itself. Immediately on bankruptcy the bankrupt may be imprisoned as a precautionary measure, bankruptcy being thus

viewed in its right light as *primâ facie* a criminal, or at least a moral, offence. All his property is at once got in and realized, and the proceeds deposited in the "Caisse de Dépôts et Consignations," where it bears interest at 3 per cent. for the benefit of the estate. Syndics have to pay over within three days all sums received by them, under heavy penalties. Compositions and liquidations can only be resorted to with consent of the creditors after proceedings have been commenced in bankruptcy. The criminal part of the French bankruptcy law, under the two heads of "Banqueroute simple" and "Banqueroute frauduleuse" is admirable in its wisdom; for, while the latter includes all the fraudulent acts recognized as criminal offences by English bankruptcy law, the former comprises all those reckless and pernicious speculations and sham tradings which lie at the root of so many bankruptcies in this country, and which our law practically ignores. Prominently among these figure the omission to keep the books before referred to, and the raising fictitious capital by means of bills or loans. Finally, the rehabilitation of a French bankrupt is guarded by a variety of precautionary measures, which render "whitewashing" a far more difficult process in France than it is in England. If M. Goirand's book gives the slightest stimulus to the reform of our bankruptcy law by thus displaying "a picture of what it might be," its author will have conferred no small benefit on this country. Apart from this, we have to thank him for affording English lawyers an opportunity of extending their studies beyond the beaten tracks of every-day practice. The lawyer who makes himself familiar with the law of other countries is far more likely to form a liberal and enlightened conception of the science of law than he who confines himself merely to that by which he has to make his living.

A LADY'S TOUR IN CORSICA.*

THERE can be, we should imagine, but few travellers to the Riviera who have not looked with longing towards the island of Corsica. It is not every day that from Mentone, or Bordighera, or San Remo, across the hundred miles of blue sea, its mountains can be seen rising up as if they were a vast reef of rocks. Sometimes for a week or two not a glimpse can be caught of the island. At other times it may be seen at sunrise and at sunset for some days together. It is a matter of common talk among the strangers along the Riviera. No one forgets to tell his neighbour that that day he has had a fine view of Corsica. Every one looks at it, and all who have imagination enough to raise them above the level of an oyster long, as we have said, to visit it, and even plan some future trip. These trips remain for the most part like the island itself—in the far distance, and fade away beneath the sober light of day. Some people are discouraged by the reports they receive of the hotels, while others dread the sea-voyage. From Marseilles to Ajaccio the steamboat takes sixteen hours. From Leghorn to Bastia the voyage is of only half that time; but Bastia is on the wrong side of the island for winter residence. A long journey by diligence must be encountered by the traveller before he can reach a climate which does not yield to that of Mentone itself. He will no doubt be repaid by seeing some very fine scenery, but he must be ready to face the rudest accommodation at the inns on his way. There are, moreover, those who are kept away by the fear of brigands, and who imagine that behind every tree and rock may be discovered the gleaming barrel of a rifle pointed towards the traveller's head.

The two volumes before us will do something towards smoothing the way for the traveller, and will show him what he must expect if he ventures to roam over the island, and where he can find the best accommodation. They will dispel, at all events, one fear. Where three English ladies have travelled alone there can be little fear of robbers. In fact, Miss Forde fully confirms what we had often heard before, that brigandage has ceased in Corsica. Even of old the Corsican brigands were not like the robbers of Sicily and Italy. It was against the Government or some powerful neighbour that they had lifted their hand, and they took to the mountains for safety, and not for the plunder of passers-by. A stranger might have travelled through the island with almost as much security as he might now through the most disturbed districts of the West of Ireland. In both one country and the other his chief danger would have lain in his being mistaken for some inhabitant of the place who had been long marked out for assassination. Corsica has one great advantage over Ireland—it is not disgraced by swarms of beggars. There is an honest pride about the people which, if it were found in the other isle, would quickly put a stop to most of their miseries. During her long tour Miss Forde and her companions only encountered two beggars. In the famous pass that leads to the head of Killarney the traveller might count himself happy who had not to run the gauntlet of two hundred. Antonio, our tourists' driver, "had been very eager in his dignified way" to insist upon the absence of beggars. "Mademoiselle," said he solemnly, "there are no beggars in Corsica. No man begs, unless he has lost the use of his limbs, and cannot work." In fact, the only two people who asked for alms belonged, in Miss Forde's somewhat fine language, "to the category of cripples." One had lost a leg, and the other had not yet recovered from the amputation of an arm. But, though the Corsicans are too proud to beg, they are unhappily very little given to work. We trust, however, that Miss Forde greatly exaggerates when she says "Toil and beggary are equally obnoxious and degrading in their eyes." As they do not beg, so neither will they cheat. All the English, she says, are looked upon without exception as wealthy. "'How can you say you are not wealthy when you have come all this way to amuse yourselves?' was frequently said to us in a tone of conviction." Nevertheless, she adds, "imposition and overcharging to strangers is almost unknown." Only once did these three unprotected females meet with the slightest rudeness from a grown-up person. "One could," the author writes, "scarcely say as much for many more frequented countries, after incessant travelling for several weeks in their loneliest and wildest regions." It is not, however, so far as our experience goes, in the out-of-the-way parts of civilized countries that strangers meet with rudeness. It is in the suburbs of great towns that the manners of the natives are, for the most part, seen at their worst. While the grown-up Corsicans are the model of politeness, as much cannot be everywhere said of the children. At Corte, the capital of the island, they are, it would seem, a dreadful plague. They bar the path of a stranger by stretching a piece of stout cord across the road, and shouting out, "Sou, sou, Inglese." Our three travellers were one Sunday evening beset by a troop of urchins. "I have noticed," says Miss Forde, "that a demoniac phase often comes over naughty children on a Sunday evening." The rope that was stretched across the path of the three ladies happily broke; but "two youthful fiends" used the broken remains to wind the travellers up and hopelessly confuse their footsteps. "Human endurance could bear no more, and No. 3"—the ladies are numbered by the author as if they were so many convicts—"brought down her umbrella upon their degenerate backs with as much force as nature had supplied to her." Instantly the Corsican youth turned from sport to serious warfare. They opened fire with a volley of sharp stones. But the honour of the island was to be saved. From a cottage hard by dashed out three big boys, who put the persecutors to flight. "Two of them, boys of about fourteen or fifteen, had pipes in their mouths; and one of them, a young man a year or two older, remarked sagely that it was always thus with visitors, 'Les enfants de Corte étaient terriblement méchants.'" They dragged back to the injured ladies one of the criminals for punishment. As the travellers were coming back on their return to their inn the same big boys overtook them. "Quietly remarking that they would see us safe home, they escorted us to the door of our hotel with much polite conversation, and then made off, raising their caps":—

> These boys were in the lower ranks of life, although decently dressed; but it would have been an insult to offer them any recompense. Their action proceeded from chivalry *pur et simple*, and they had no notion of any reward.
>
> Weeks afterwards, when two of us returned to Corte, a smiling face suddenly attracted our attention in the streets one day, and we recognized one of our boyish defenders. Of course we greeted him, and he lifted his cap, remarking, "I have seen *you* for the last half hour."

In one respect Corsica would seem to be far ahead of England. According to Miss Forde, it has a telegraphic service which might excite our envy. "You pay," she says, "a penny a word for telegraphic messages; and there is scarcely a village in the country without its office." The travellers arrived one day at a hopelessly dirty village under Monte d'Oro. Its hotel—for it boasted one—was a filthy-looking broken-down tenement, with a ruinous staircase and two stuffy bedrooms. They hoped to get better accommodation at the next town, and they hastened off to hunt for the telegraph-office, "which exists in every little village in Corsica." It was on the first story of a house, and it was only reached by climbing up a ladder. Those who live in country villages in our own country may with good reason regard with envy the facilities that are thus afforded to the Corsicans. A few years ago, ten shillings was the extra charge—and, for all we know, still is—on a telegram sent to a spot so much frequented by tourists as the village of Buttermere.

The civility of the inhabitants and the excellence of the telegraphic service are, unfortunately, counterbalanced by the miseries of the wretched hotels. There is, says Miss Forde, but one really excellent hotel in the whole island, and that is at Ajaccio. When, however, she takes us to that town we find that there is also a second hotel which, if not excellent, at all events was reported to be comfortable and well managed. But what are two hotels to a whole island? Our three travellers were certainly not given to grumbling, and they took whatever came across them with a patience that was not shown by Seneca in his banishment to Corsica, with the aid of all his philosophy. Nevertheless, their fate was at times too hard for them, and they gave way to lamentations and complaints. In one inn they were told that they could only have two chambers, as the third was at that time "occupied by *les vers*." They peeped in and found "a mass of sleepy silkworms, hard at work absorbing cabbage-leaves." To any one, by the way, who has watched a silkworm eating, *absorbing* will seem a somewhat absurd term. This was not the only place where the travellers found that to these animals had been given up the best bedroom in the inn. The food was for the most part of a very poor quality. "In inland Corsica," Miss Forde says, "neither butter nor honey can be found." That she should not have been able to get honey is indeed very strange. Its quality, indeed, was by no means highly

* *A Lady's Tour in Corsica.* By Gertrude Forde. 2 vols. London: Richard Bentley & Son. 1880.

esteemed by the ancients, as the well-known line in Virgil shows; but, so far as quantity went, there was abundance. "There is," wrote Boswell, "a vast quantity of honey produced in Corsica," and he describes how the Franciscan fathers at Corte had thirty or forty beehives, and how, when they wanted to get honey, they drove away the bees by the smoke of burning juniper-wood. One good meal a day can be got, our author says, even in the tiniest village—namely, a dinner at sunset; but for breakfast the traveller can get nothing but sour bread and coffee, and for lunch sour bread and cheese. Neither tea-spoons nor saucers are supplied; but, on the other hand, in the poorest inns there are perfectly clean napkins. We wish the same could be said of every London eating-house. When dinner is finished it is always the custom in the smaller inns for the guest to have a friendly chat with the landlord and his wife. "The reserved Briton who would decline the after-dinner chat with his host or hostess would be considered a very churlish individual."

While there certainly is a good deal of lively reading in these volumes, it is a great pity that they should be overladen with fine descriptions and big words. We might have stood one or two accounts of the scenery; but the author returns to it again and again, till we begin to grow weary of it. A Corsican gentleman whom she fell in with as he was returning home after a thirty years' residence in France, described the island to her as "un beaux (*sic*) pays." The French, no doubt, is not in accordance with the rules of grammar, but, at all events, it has the merit of extreme simplicity. It pleased us better than some of the author's own accounts. Thus, six pages further on, we read that it is "a country grandly prolific of beautiful flowers." In another passage we are told of some flowers that, "with a host of other gorgeous floral dainties, massed and tangled themselves together in a blaze of beauty." Next we learn that from Corsica could be seen Elba, "majestically grand in the dappled sunlight." Later on we come to "blue clouds," filling up some gaps made, if we understand the passage rightly, by the sun peeping through dark rifts. Now in blue clouds we have no belief whatever. Pigs and dogs are called "porcine and canine companions," and we read of a drum that was "made to exert itself to the fullest extent of its parchment lungs," while a village "looked greyly down." The First Napoleon is called a compatriot of Corsica. On one occasion we read that our tourists just escaped rolling down a hill "with concentrated force of the action of gravitation."

Like most travellers who take to writing their tours, Miss Forde falls into the mistake of thinking that, because she has travelled in a country, she is for that reason competent to write its history. A man might, with as good a show of reason, think that he has become competent to describe the method of brewing, because he has lately taken to drinking beer. The account she gives of that strange but impudent Pretender, King Theodore, is utterly absurd. She writes of his great talent, his great genius and enthusiasm, and his untiring exertions for the good of his country. By "his country" Miss Forde means Corsica, in which the Pretender stayed about eight months in all. Yet in this brief time, if we are to believe her account, "he established manufactures and promoted with all his power art and commerce." The ship in which he arrived was, she says, well furnished with gold. He had certainly raised some money in Tunis under pretence of conquering the island for that Power; and he got some more by selling as soon as he landed, like a knave that he was, the vessel which the Bey had lent him. But his treasure did not amount to much. He scattered a few coins in a debased currency among the people, and, as Voltaire says, "il donna des souliers de bon cuir, magnificence ignorée en Corse." The tomb of this great genius, Miss Forde says, may be seen in Westminster Abbey. When last heard of, it was, we can assure her, in St. Ann's Churchyard, Soho. Can she have confused him with "Theodore Phaliologus," who, as we learn by Dean Stanley's Memorials, lies buried in the Chapel of St. Andrew, in the Abbey. We may certainly forgive her mistake when she says that the bones of Paoli lie in St. Pancras Churchyard. They lay there for sixty years, but in 1867 they were removed to Corsica. Miss Forde has had one merit, not very common in amateur historians. She has kept her history to a chapter of its own at the very close of her book. All, therefore, that the reader has to do is to take warning, and to stop in time. If he does this he will, we believe, agree with us that these two volumes, though they are too carelessly and too finely written, yet have in them many passages that are both lively and interesting.

RECENT CLASSICAL PUBLICATIONS.*

MR. COOPER has done well in reproducing the labours of earlier workers on the field of Horace as well as of some comparatively late ones, the line being drawn at the date of Mitford, Wrangham, Leigh Hunt, and Thomas Hood, and excluding more modern translations or imitations. What makes his volume still more welcome is the inclusion, in the second part of it, of burlesques, parodies, and similar compositions in imitation of Horace, ranging from Andrew Marvel to Hood. Although we can do little more than draw attention to the volume, we may cite an ode or two from either part of Mr. Cooper's selections. A quotable ode, for instance, offers itself in Archdeacon Wrangham's version of i. 20. "Vile potabis modicis Sabinum":—

> In sober cups, Mæcenas dear,
> Partaker of my humble cheer,
> Thin Sabine draughts you'll taste,
> Which I in modest Grecian jar
> Stored on that happy day, when
> In playful echoes cast,
>
> The crowded Theatre's acclaim
> So hailed you that old Tibur's stream
> From your paternal shore,
> And Vatican's green hill around,
> Catching the high triumphant sound,
> Threw back the joyous roar.
>
> At home bright Cæcuban your lip
> And Cales' luscious growth shall sip
> Campania's costly wines;
> Alas! the slope of Formiæ's hills
> For me no generous juice distils,
> Nor rich Falernian vines.

In the last line we have ventured to correct an obvious misprint, for "wines" would neither match with the counterpart Latin "vites" nor form a permissible rhyme with the third line of the stanza. We are reminded of one or two similar misprints, *e.g.* in p. 27, Ode 17, *Usticus* is misread for Ustica's; and in p. 83, in the noble close of the 5th Ode of the Third Book, we find the pleader turning "to some Venaran (it should of course be Venafran) dome." In the second part of the volume we find a happy imitation of the ode given above by George Daniel, author of the *Modern Dunciad*. It is headed "A Poet's Invitation":—

> If you come to dine with me,
> Dainties must not be your care.
> Harmless pleasure, social glee,
> And the poet's frugal fare—
> These I give; and, should my lord
> Me to visit humbly deign,
> Port is all I can afford;
> He must bring the bright champagne.
> Cool beneath a spreading vine
> Jovial Horace, thirsty chap, he
> Quaffed his rich Falernian wine
> With Mæcenas, snug and happy.
> We in lodgings near the skies,
> Of Apollo humbler scions,
> Banquet amidst London cries
> And the bray of Kent Street lions.

The allusion in the last line, if we mistake not, is to the Surrey Zoological Gardens, a memory of the past, not far from the "Elephant and Castle." The editor has revived many similar imitations, such as that of Ode 4, Book I., in James and Horace Smith's *Brighton*; *Cupid's Invitation*, Ode 23, Book I.; and several others from the same prolific pair of poets and wits. Other examples are supplied by Lord Morpeth, by George Canning, and the poets of the *Anti-Jacobin Review*. We will only further mention Andrew Marvel's two inimitable parodies—"An Horatian Ode on Cromwell's Return from Ireland," and his translation of a parody of "Jam satis terris," 1 Od. II., "ad regem Carolum." This book deserves a place in every scholar's study.

We have to thank Sir George Cox for his scholarly reading, after the text of Orelli, of what the editor regards as a series of continuous treatises on poetry. Of the very useful introductions, we may especially point to that on Ep. II. as fixing approximately the relative dates of Horace's writings, and furnishing a summary of the critical matter with which the poet sought to deal in the Epistles and the *Art of Poetry*. It is excellently adapted, like the two that succeed it, to supply the circumstantial data required for understanding the subject-matter of each poem in its order. When we proceed to the notes, we find them particularly sound and succinct on critical and textual questions, lucid in their dealing with Greek and Roman mythology, and generally sufficient as a commentary for elder pupils. For instance, on v. 5, "Romulus et Liber pater," &c., Orelli is cited for the story given from Dion Cassius that Octavius wanted to be called "Romulus," but contented himself with the title of Augustus (*h.e.* σεβαστός); and the note on the number of twin gods and heroes in the mythologies of the Aryan nations is very germane to the subject in hand. So, too, in illustration of "Afrani toga," ii. 1, 57, the note on the divisions of the Comœdia Togata is opportune. In reference to 96, "Marmoris aut eboris fabros," Sir G. Cox aptly calls attention to the famous workers in bronze, ivory, and marble, the remains of whose genius are in the present day being unearthed in elucidation and illustration of ancient poetry and literature. We should say, too, that his notes are always to the point, as regards faithful exposition of the best commentators, in dealing with such proverbial expressions as, i. 31., "Nil intra est oleam," &c.; 105, "Cautos nominibus rectis expendere nummos"; 176, "Recto talo," with its parallels from Pindar and Euripides, and so forth.

Although there is certainly no lack of classical reading-books made up of books or selected passages of Cæsar, more or less accommodated with notes, maps, vocabularies, and other like

helps, and one might wish Mr. Bennett had handled a less trite subject, yet we agree with him as to the value of Cæsar as "the best author for boys to attempt after they have learnt some grammar and done some little translation in an easy reading-book." The student of these Selections is indebted to Mr. Bennett for concise explanatory notes, a biographical and geographical index, a handy map of Gaul, and a very serviceable though short, sketch of Cæsar's life. In studying by this text the chapters comprising Cæsar's account of Britain and its inhabitants, and his first and second invasions, we have noted as helpful the care taken to match each military functionary with his modern parallel. Thus a "legatus" was over each legion as a "staff officer," whilst one quæstor (or quarter-master-general) was above all these, himself acting immediately under Cæsar. Archæological notes, adapted for young readers, are represented by that on *ædificia* in vi. 43, where we are simply told that these "were probably in the shape of a bee-hive." A sufficient light is thrown on Latin idioms as regards dates where, in § 54, we are told that "post diem quartum quam = die quarto postquam," as the 2nd of January, expressed in Latin, would be "ante diem quartum Nonas Januarias," equivalent to "die quarto ante nonas Januarias. Everywhere we have found the notes well-judged and easily intelligible.

A very useful book, in small compass, is the *Unseen Papers* of Mr. T. Collins, M.A., Head-master of Newport School, Salop. It is easy, but not too easy; each piece is measured out in a length of which none but a dunce would complain; and at the foot of every passage are given three or four simple and pertinent questions. A cursory survey leads us to credit a good many of the poetical pieces to Ovid and Virgil and the Latin Elegists, of the prose to Cæsar and Livy. The *Fasti* have been largely taxed and made to yield such critical questions as the distinction between *simulo* and *dissimulo*, *jacio* and *jaceo*, *oblitus* and *oblitus*, whilst a line or two of Cæsar's about Dumnorix the Æduan opens a field for ascertaining a pupil's capacity to derive "sponte" and "injuriâ," to give the meanings of "Legatus," and to distinguish between "Duco" and "Nubo." Mr. Collins seems to have availed himself of a tradition of "unseen papers" which we clearly recollect in vogue at Christ's College, Cambridge, more than a quarter of a century ago, and which undeniably tended to form habits of accuracy in scholarship.

The *Persæ* of Æschylus, briefly annotated by Mr. F. A. Paley, is valuable, even in its condensed form, because Mr. Paley's δεύτεραι φροντίδες are always thoughtful, and throw the light of a subtle criticism on dubious passages. He also compresses so much varied and sound matter into his introduction as affords the best help to the understanding of the play both as a whole and part by part. We may refer to his lucid explanation of the famous ψυχαγωγία of Darius, v. 683 (*cf.* Eumenides), as well as of the rites that lead to it (compare Soph. *Electr.* 896). When evoked from the shades, the departed monarch gives much sage counsel to his trusty councillors and contemporary elders, and paves the way for the entrance of the crestfallen king his successor, by denouncing the covetousness and sacrilege of the Persian army as the causes of the late disasters and of others yet in store. In the part of the drama which contains these scenes no note has been omitted that could serve to elucidate action or language. For instance, on 527, where Atossa says of her propitiatory offering to Darius,

ἐπίσταμαι μὲν ὡς ἐπ' ἐξειργασμένοις
ἀλλ' ἐς τὸ λοιπὸν εἴ τι δὴ λῷον πέλοι,

"I well know that it is all too late; but it is with the hope that for the future better things may happen," Mr. Paley points out that ἐς τὸ λοιπὸν is taken by the scholiast to mean "for the survivors," ἐπὶ τοῖς ζῶσιν ἀνθρώποις, whilst in προσθῆται, at 533, she seems to forefend her son's suicide. In 557 *seq.* the drift of the passage, as we are told, is "Why was Darius a general who inflicted no losses by land on the citizens, while Xerxes has met such losses with his navy?" But Mr. Paley opportunely reminds us that this laudation of Darius is inconsistent with fact and with v. 246, *q. v.*; whilst, a little further on, he comments on the true Greek irony which Æschylus practises at 585 *seq.* in making the Persian chorus lament that they will no more have the privilege of paying tribute to their own masters; and in the next clause, hitting, in the same spirit, at the license of speech henceforth allowed to the plebs. We hold in high value these handy "Cambridge Texts with Notes."

CHRISTMAS BOOKS.

III.

THE publishers of Christmas books seem scarcely to have got into their stride as yet this season. Perhaps they are keeping the best books for the last, and it is certain that one or two splendid pieces of printing and illustration have appeared which deserve fuller notice than they can receive in this column. We can find nothing more imposing to head the list than *Little Buttercup's Picture Book* (Routledge and Sons). Here is a very big book for very little girls. Yellow buttercups, and a gilt figure of a child, occupy a deep blue field on the cover. The contents are chiefly large woodcuts and moral verses. The frontispiece, "a basket of mischief," is a clever rendering of a picture of an open hamper full of kittens. Then a didactic poem introduces the infant mind to Little Ann who was discontented because she had not a carriage; and to her mother who pointed out that, if Ann had no carriage, another little girl was still worse off, and had no boots. Language fails to convey much idea of the imbecility of the features and expression of Little Ann's parent. The poor little girl in the garret, on the other hand, is prettily drawn, and may tempt a youthful reasoner to prefer picturesque poverty to the comfort of the *bourgeoisie*. There is a tolerable sketch of a watchdog watching over an edifice rather like the Albert Hall. In "Jack and the Bean Stalk" the sleeping giant is pretty well done, but we cannot praise many of the smaller engravings, in which buffoonery does duty for humour. An ugly female centaur, in a hat and habit, is called "the centaur of attraction," and several other sketches look like old blocks from some third-rate comic paper.

Schoolboys all the World Over (Routledge and Sons) is adapted from the French by Mr. Henry Frith. It is rather French to name a schoolboy hero "Adam Smith." One might as soon expect to meet John Stuart Mill disporting himself in the backwoods with a Winchester repeating rifle. There is a splendid picture of Adam Smith shooting an Indian spy. The Indian, a very dandified brave, holds his left hand to his face, with a coquettish smile; in his right is his tomahawk, very unlike the pattern to which we are accustomed. Adam Smith is firing at him with only about five yards "rise," and, of course, is likely to bring him down. By the way, the story says, "In the hand of the savage was an ensanguined object which I could not mistake." This was the scalp of William, the boyish friend of Adam Smith. The artist has omitted to draw the ensanguined object, and, if William is scalped at all, in the picture, his scalp must have grown over his right temple. The memoir of "Wooly Head, the little Australian," is interesting; but though Wooly Head tells us that it is disagreeable to be tattooed, he omits to say how he liked having his front teeth knocked out, a ceremony which, among the blacks, occurs about the period when English boys are confirmed. There is a very exciting passage in this tale. Wooly Head's father, tired of having nothing to eat but black serpents, and very little of them, proposes to make a meal of his eldest son and heir. The conclusion of the adventure must be sought in the book itself.

The Boys' Own Annual contains stories about "boy captains," boy foxhunters, boy campaigners, and the "Revenge of the Red Man," in some thirty thrilling chapters; but the gem of the volume is the work on "Cricket, and How to Excel in it," by the renowned Dr. W. G. Grace. "W. G.", if we may call him so, begins with the history of the sport, at which Edward II. seems to have been a respectable performer. He then rapidly passes to the last century, and gives a copy of one of the old pictures at Lord's. We think Dr. Grace is hasty when he avers that "a high hitter is invariably a low scorer." Mr. Thornton and Mr. Fowler are not invariably low scorers, and Mr. E. M. Grace is not invariably a low hitter. He is afraid that bowling is not unlikely to degenerate into throwing, and certainly some fast amateur bowlers do seem to many spectators to be throwing rather than bowling. On the whole subject of bowling Dr. Grace's words would be written in letters of gold on a ground of purple if we lived in the days of good Haroun Alraschid. We regret deeply to learn, on this indisputable authority, that "short leg is the place where the greatest duffer is usually put." Dr. Grace adds, however, with perfect truth, that "short leg is not so easy as it looks." It is, indeed, the post for what an accomplished author calls a "mature cove"—not a mere boy, but a steady man, with real knowledge of the game.

Pizarro; his Adventures and Conquests (George M. Towle. Routledge and Sons).—The most determined hater of history cannot but read with absorbing interest the account of the conquest of the New World by the Old. The splendours of the Empires of Babylon and Assyria, even the gorgeous hues of Lord Beaconsfield's later works, pale before the sumptuousness of the palaces of Montezuma and Atahualpa, and grow dim beside the brilliancy of the Temple of the Sun. All our amazement at the daring and success of Cortes and Pizarro is swallowed up in regret for the feather-work destroyed, for the emeralds broken, for the gold vessels melted down in order to make a fairer division of the spoil. Mr. Prescott has made these things real to us, and we could almost draw from his descriptions the fair cities gathering round the lakes or clustering up the mountain-sides, and the people whose lives seem all laughter and love, but who possessed laws and a civilization of their own. To those who have not the good fortune to be acquainted with Mr. Prescott, Mr. Towle's book will be a boon. He sketches the life of Pizarro from the time when he ran away from the wretched hovel that was his home in Truxillo, and sought his fortune under the banner of the great Captain. Over this period, however, Mr. Towle passes lightly, and the real interest of course attaches to the time when he went out to Panama, and began to dream of the El Dorado that lay to the south. In these days, when everything is cut and dried, it is hardly possible for us to conceive the state of mind of a man like Pizarro, or the difficulties he had to surmount before even beginning his enterprise. There was the jealousy of the supreme Governor, who very reluctantly granted ships, men, and money; there was the ignorance and superstition of the sailors to overcome; and when they at last set sail, there were the perils of the unknown seas, and the dangers from the Indians. At first he met with endless disasters, but his spirit rose above them all, and after returning to Spain, and obtaining the personal sanction of Charles V., he set forth once more to complete his conquest. In the tragedy that ensued, we have less pity for the fate of the traitor and murdered Atahualpa than for that of the gentle Montezuma; though, on the whole, the

behaviour of Cortes was less treacherous and bloodthirsty than that of Pizarro. But this is a nice question, and it would be better not to enter into it. The closing scenes of the drama are described with simplicity and force, and to others besides the "boys and girls," for whom it is professedly written, the book will be full of excitement and interest.

Reedyford; or, Creed and Character (Silas K. Hocking. Ward, Lock, and Co.)—Mr. Hocking cannot be considered a successful writer of stories. Although he piles one sensational incident on the top of another, they have all a curiously domestic air, and do not for one moment excite or alarm us. It is to no purpose that he hints that the betrothed of his heroine is really a burglar, that he has his hero thrown down a shaft by the said burglar and his accomplices, or that another estimable young man is apparently drowned at sea. The reader absolutely refuses to be moved. He cannot even be touched by the immense amount of theological talk scattered up and down the book, or by the fact that the valetudinarian sister is always mentioned as "dear Amy," between inverted commas. He is glad when his task is done, and looks eagerly for a book with less pretension and more interest.

The Fisherman of Rhava (C. E. Bourne. Sonnenschein).—This story, which is really an allegory, has all the charm of the Northern legends of the mighty men of old. The prize to be won is the entrance into the distant island of which the hero, Djalmah, gets a glimpse, but into which he may not enter till he has learned to put aside himself, and to do great deeds. He begins at once, and, after performing many brave actions, ends with the bravest of all—forgiveness of a friend who has betrayed him. So he wins an entrance into the Island of Ettau.

We thought Mr. Wills had taken sufficient liberties with history when, in his tragedy of *Charles I.*, he makes the monarch say "Remember!" to Henrietta Maria, instead of to Bishop Juxon; but we hardly expected to see the mistake repeated in a little book called *A Silver Key to a Golden Palace*, by Alton Leslie (Routledge and Co.) It is about a child who is locked by accident into the Crystal Palace, and at night the statues of the kings and queens began to dance, and Charles I. was stooping over his "young" wife (they had been married twenty-four years) murmuring "Mary—remember." Then Shakspeare and Anne Hathaway appear on the scene, and, finally, sketches from the plays. It is a pity to confuse children's minds with nonsense like this.

The Mountain Sprite's Kingdom (Stories by the Right Hon. E. Knatchbull-Hugessen, Lord Brabourne. Routledge and Sons).—These tales are very dull indeed. The author has fallen into the mistake of thinking that to minutely describe details is to make an interesting story, but the result in this case is unutterable dreariness. There is the usual mixture of things ancient and modern which is an invariable part of latter-day fairy tales, and is another element in their failure. To be successful, fairy stories should belong to all time and to no time, and should certainly have no local habitation. How can elves be expected to care for a family called Newton, travelling in Switzerland for pleasure?

Adventures in the Far West (The late W. H. G. Kingston. Routledge).—The world itself seems hardly able to contain the books of the late Mr. Kingston. It is really astounding to contemplate the amount of manuscript he must have left behind him, for his works keep pouring in as persistently as of old. That they have not fallen off in excitement may be gathered from the list of illustrations at the beginning—"An Encounter with Wolves," "The Prairie on Fire," "Indians Scalping the Slain and Wounded" —and so on. In the illustrations themselves the human figure, as usual, fares badly, but the animals are comparatively good.

The leading story in *The Day of Days* ("Hand and Heart" Publishing Office) is "The Web Ismene Wove," by Emily Holt. It is the history of a Greek family in Jerusalem, and their names are rather hard for the probable readers of *The Day of Days*. It also seems strange to find a Jewess called "Glaphyra." The rest of the matter is of a religious kind.

Meyrick's Promise (E. C. Phillips. Routledge).—This tells how some children lost their parents in the Jamaica insurrection in 1865, and how a little boy of seven fulfilled his promise of looking after his sister. Except for a tendency to give the past histories of all the characters, the book is pleasant and natural, though the style is often clumsy. For instance, the expression that it is bad to indulge "a wilful or any dispositioned child" is hardly English.

With the Colours (R. Mountney Jephson. With Illustrations by R. Simkin. Routledge).—As its name implies, this is a military story of the adventures of a young ensign. They are neither very exciting in themselves nor particularly well told.

Kate Greenaway's Birthday Book (Routledge).—The old-fashioned children in mob-caps and poke bonnets are as charming as ever, and, we regret to say, the verses are as weak.

We have received Messrs. De La Rue's Christmas Cards, decorated with much variety of art. Here, for example, is an agricultural maiden of ravishing beauty, sitting on a stile, and about to drink some beer; a little Greek maiden, with gold-fishes in the foreground, and in the distance the violet hills of Hellas, is charming. People of the last century pelting each other with roses, and other designs on silk, are agreeable tokens of the approach of midwinter.

Messrs. Bemrose's convenient Diaries, with proverbs for every day of the year, recommend themselves to the practical man of business rather than to the æsthetic dilettante.

Mr. Poulton finds his ideal of Christmas Cards in coloured photographs of flowers, which present a spectacle of tropical gorgeousness. Flowers, pug-dogs, and pictures of the revelries of Yule occupy the accomplished artists of Messrs. Hildersheimer and Faulkner. "We know not which is sweetest, no, not we," to modify a line of Mr. Tennyson's; but all these cards seem likely to gratify the proper sort of recipients.

FRENCH LITERATURE.

THE book of the last month in France is unquestionably M. Renan's *Eau de Jouvence* (1). Conceived on something like the plan of *Caliban*, and professedly a sequel to it, it is much more complex than that curious production, and deals with a much wider range of subjects. In some sort, indeed, it is a kind of recantation or counterblast, the follies and faults of the Legitimist party being shown up nearly as glaringly as the follies and faults of the Democrats were in *Caliban*. The political scope of the book also includes a terrible attack on Germany, which, from a purely literary point of view, is one of the best things the author has done, a rather unkind side-blow at the promoters of international and unlimited copyright, and a good many other things beside. The way in which these various topics are brought within the compass of a short dramatic romance of a hundred and twenty loosely printed pages is, to say the least, ingenious. The "eau de Jouvence" of the title is not the famous fountain which was such a favourite dream of the Renaissance that its invention has sometimes been ascribed to that period, though, as a matter of fact, it is to be found in the twelfth-century *Roman d'Alixandre*. It is rather the *elixir vitæ* than the fountain of youth, and is represented as being the result of Prospero's chemical researches, which have enabled him to discover alcohol and ether. At the beginning of the play the deposed Duke is once more visited by a body of his faithful Milanese nobles, anxious to obtain his consent to head them in an attempt to overthrow the Republic. Prospero, however, does not at all like the means (stock-jobbing crises and discreditable squabbles in the Assembly) which the faithful nobles regard as the most effective weapons in their crusade, and he gives them, to their great disgust, something like a flat refusal. Hereupon they shake the dust from their feet and renounce him. He in his turn changes his name, calls himself Arnold of Villeneuve, and devotes himself to chemical researches with more ardour than ever, so that he soon acquires the fame of a magician and of having raised some from the dead and restored others to youth with his "eau de Jouvence." After the first act the scene is chiefly at Avignon. The aged Pope is very anxious to regain his youth, and a little afraid of what may happen to him after death. He is thus doubly desirous of the elixir, though his favourite, Brunissende de Talleyrand, discourages the idea of artificial rejuvenescence in a manner which would perhaps be more philosophical if she herself were not in her first bloom. However, Arnold is summoned, and comes. But the Pope is soon in a great difficulty about him. The Sorbonne, the Inquisition, the Emperor, the rancorous nobles of Milan, the Milanese commonwealth, all publicly or privately demand his death or surrender. The embassy in which the demand of the Empire is signified gives occasion for the onslaught on Germany already mentioned. "Siffroi, Seigneur Palatin"—the month of November has been fertile in aliases for Prince Bismarck—arrives, and delivers blood-and-iron opinions in the most outrageous manner. As a matter of curiosity, however, he attends one of Arnold's distillations, and, snatching the elixir as it issues from the alembic, drinks it off, only a small part of it being wrested from him and quaffed by Sir Leoline, an Irish knight-errant. Both become entranced, and the dreams of both are given. Leoline's are all love and beauty, but they are mere reminiscences; Siffroi's, all blood and ravage—reminiscences too. The elixir puts into the heart and brain nothing that was not there before. Finally, after much else—for the thing, short as it is, is full of matter—Arnold finding himself *de trop* in the world, seeks euthanasia by means of ether, surrounded by all the good characters of the story, including Ariel, who revisits his master at the closing scene. Among the numerous episodic passages may be mentioned a really fine masque of the Guillotine, which supernaturally takes place on the bridge of Avignon at night. The book has plenty of M. Renan's usual faults; but, as a literary work, it deserves a good deal of praise.

M. Caro's work (2) is always solid and thorough, and to say this is to say a good deal. To brilliancy of style or great depth of insight he can hardly pretend; but the latter is so uncommon that no one can be surprised at its absence, and the former is, in Frenchmen at least, so common, that its absence may without much paradox be said to be rather a relief. These studies of the later eighteenth century consist of republished essays, of which the most important are a set of seven on the Assézat edition of Diderot, a set of five on M. Gabriel de Chénier's edition of André Chénier, and a set of three on Mme. de Staël. Detached essays on Montesquieu, Horace Walpole, Mme. Roland, and several other persons of interest, complete two volumes which for sober good sense and accurate information far exceed most volumes of republished essays.

With M. Caro's work M. Barbey d'Aurevilly's is naturally taken. It displays every fault from which the volumes just mentioned are free. An exaggerated and *baroque* style, violent abuse of all and sundry, complete blindness to the merits of the things

(1) *L'eau de Jouvence*. Par Ernest Renan. Paris: Calmann Lévy.
(2) *La fin du 18 siècle*. Par E. Caro. 2 vols. Paris: Hachette.

persons that the author does not like, insufficient information, prejudice underlying and overlaying every judgment—these are the main characteristics of *Goethe et Diderot* (3). Certainly we are far from saying that there is not room for a good deal of iconoclasm in the case of Goethe. As to Diderot, the idol has hardly yet been set up, and the most active of his setters-up have been the foremost to recognize his feet of clay. But neither one nor the other, certainly not the first, is a person to be appropriately treated with mere brick-and-dead-cat-throwing. M. Barbey d'Aurevilly prides himself, we believe, on his style. What kind of style this is a few quotations may serve to show. "Il [Goethe] était badaud depuis l'axe de son être jusqu'à l'épiderme." Here is a fine collocation of metaphors truly. "Ce qui fait que M. Genin, dédrisé, comme une blanchisseuse mystifiée, peut se retourner au lavoir avec sa brosse et sa cuvette;" "l'homme qui a le plus roulé de fatras dans le fracas de ses œuvres." Cacophonous as is this last expression, it is not a bad description of M. Barbey d'Aurevilly's own style. There is vigour and occasional brilliancy in him; but a man who talks such jargon as he does, and who tells us that Goethe is a "gélatine figée," and that *Manon Lescaut* is a "chef-d'œuvre de bassesse dans la pensée et de platitude dans l'expression," almost shuts himself out from serious consideration.

We have yet another book (4) dealing with the eighteenth century. Most of the figures are familiar ones, and the author's treatment of them has no very great distinction. The morality of the book is excellent, but sometimes M. de Lescure has allowed his indignation to get the better of his justice. St. Lambert, for instance, was a good deal more than a "fat de garnison."

MM. Paul Lacroix (5) and L. de Ronchaud (6) have chosen for their volumes two women of unequal fame, but both notable enough in their way. The author of *Valérie*, and the instructress in mysticism of the Emperor Alexander I., is a person remarkable rather than interesting; but any one who takes an interest in her will find full satisfaction here. Mme. d'Agoult, or Daniel Stern, as she was pleased to call herself, holds a certain rank among the second, or perhaps the third-rate authors of the century. Some re-published thoughts and moral sketches of hers are tolerably well worth reading.

Le roman expérimental (7), a volume of criticisms chiefly, has been already noticed in these columns as far as concerns its most curious feature, the information given as to the actual wages of literature in France. Most of it, however, is purely critical, and the value of the criticism may be judged from the fact that M. Zola thinks Charles de Bernard a mere "lavure de Balzac," and holds up the brothers De Goncourt as models of style.

The French edition (8) of M. Kossuth's recollections of the Italian war, which have already appeared in English, contains a very striking portrait by Herr Unger.

The fourth and last volume (9) of M. Chéruel's exhaustive history of the minority of Louis XIV. is occupied with the last seven months of the year 1650, and with the nine months of 1651 which passed before the attainment by the young King of his nominal majority.

The fifth volume of M. Perrens's History of Florence (10) is of particular interest to English readers, because in its account of the Pisan wars it deals much with the English Free Companions, and especially with Sir John Hawkwood. The period covered is from 1359 to 1381.

It would be thought very odd in England if a publisher were to write a preface to the book he publishes, pointing out what an excellent book it is, and how capitally the author has done it. The thing, however, is not unknown, hardly even unusual, in France, and M. Lemerre, who is very frequently editor in the English as well as éditeur in the French sense of the books he publishes, has perhaps as much right to do it as most people. His new venture is a sufficiently bold one, both on the part of author and publisher. M. Lemerre, it seems, thinks that the time has come for a new *Histoire universelle*, which shall work up into readable form and manageable size the results of the enormous energy spent in special investigations during the past century. Not only does M. Lemerre think this, but he, bolder still, assures his readers that "cette histoire universelle ne vieillira pas." It may require additions, but not alteration or supersession. We should ourselves consider it a little rash to say if anything that it "ne vieillira pas," and especially to say it of even the most meritorious compilation of other people's researches. However, it is good that a publisher should have *de l'audace*. In this case the author seems to have, and to need, a good deal of the same quality. There are to be sixteen volumes of the new *Histoire universelle*, dealing respectively with the India of the Vedas, with old Persia, Egypt, Les Asiatiques (which may mean several things), Greece, Rome, Christianity, the Barbarians, Mahomet, the Papacy, Europe, the Crusades, the Renaissance, the Reformation, the Revolution, and the Nineteenth Century. Each of these vast subjects is to be treated in an octavo volume of four or five hundred pages, and each of them by the same author, M. Marius Fontane, who thus announces, Baconically, that he has taken all history to be his province. To use an irresistible piece of American slang, this is "a large order," and it rather takes one's breath away. M. Fontane, moreover, conceives history in the largest sense; flora, fauna, physical geography, comparative mythology, and the encyclopædia only knows what else, come within the extensive view of his observations. The volume which has appeared (11) deals with a subject the goodness or badness of the treatment of which only specialists are qualified to decide. We can only say that the text is written in a clear and interesting manner, and that the index contains abundant references to original authorities. As for the get-up of the book, the fact of M. Lemerre being the publisher is sufficient indication that there is nothing wanting in this respect.

M. de Tchihatcheff (12) has written a large and, in its way, a somewhat valuable, book on Algeria and neighbouring countries. Its value consists chiefly in the abundance of statistical information furnished and in the pains which the author seems to have taken to obtain that information. Painstaking observation, indeed, seems to be more M. de Tchihatcheff's forte than intelligent comment. Thus he is greatly disturbed at finding that the streets of Gibraltar have English names, and wofully disappointed because, when he goes to the races at the same place, he does not find a "fête hippique des représentants des célèbres races de l'Arabie, de l'Andalousie et de l'Angleterre." Despite his scientific inquisitiveness, too, he had a long interview with Lord Napier of Magdala without discovering that that gallant officer's name is insufficiently represented in typography by the form "Neaper." When he gets to the Alhambra he is wroth at the "goût si souvent barbare du moyen âge," because "Charles Quint eut l'audace d'accoler son disgracieux palais aux murs mêmes de l'incomparable cour des lions." It really seems hard that the poor middle ages should bear the blame of Charles V.'s crimes. On all points relating to politics and to national vanity, M. de Tchihatcheff seems, like many other *metoeci*, to be *ipsis Francis francior*. However, as we have said, he is an instructive traveller when he confines himself to fact.

M. Leclercq's *Voyage aux Iles Fortunées* (13) is rather an example of book-making than of anything else. The only island which the traveller really explored was Teneriffe. Grand Canary and Lanzerote were touched on his way home, but only touched, and the remaining members of the group not visited at all. Of Teneriffe itself the account is readable enough, but very much spun out, and devoid of any sign that the writer possesses the true knack of geographical description.

The volume of the excellent *Année géographique* (14) for 1878 has appeared. Its digest of works published relating to the subject is very good, and could only be improved by adding the prices. There could be no difficulty in obtaining this additional information, and it would frequently be of great convenience.

Of school books we have received several. *Picciola* (15) cannot be too often edited. M. Henri Bué's *Idioms* (16) will doubtless be useful, though many expressions are admitted which are in no sense idiomatic or peculiar to French, and though the English translations are not always exact. For instance, "la clef des champs" has a curious and interesting English variant, "the key of the street," which M. Bué does not give. "La critique est aisée et l'art est difficile" is in no sense an idiom. Yet, again, under "ours" we do not find "lécher l'ours," over which we have known grave translators to blunder ludicrously. But a thoroughly satisfactory book of this sort is, it must be admitted, not an easy thing to turn out.

M. Van den Berg's school history of Greece (17) has one advantage which is often noticeable in French school-books over English ones, the abundance of excellent maps and illustrations of places, coins, &c.

M. Roulier's *Second Book of French Composition* (18) seems carefully done and likely to be useful.

M. le colonel Paris, commandant le regiment des sapeurs-pompiers de Paris—Captain Shaw must feel quite humiliated at his French parallel's dignified style and title—has given in a little volume (19) a sketch of the Paris Fire Brigade system as compared with the American. That of London is not mentioned; and the Colonel is patriotically anxious to get rid of what he, with national exactitude, calls "les pompes Merry-Wather."

Mutual Loan of 1832 is chiefly of interest to private persons rather than to the general public. It contains, however, some historical passages of importance.

M. Emile de Girardin has taken up the cudgels against M. Alexandre Dumas to show that killing is not the best road to voting (21). M. Emile Girardin is deliberately of opinion that "le plus grand devoir de la femme c'est la maternité," and he kicks at this open door with great pluck, resolution, and energy.

Some fairly lively satires (22) and a really remarkable play (23) represent French poetry on our list. M. Chantavoine is at any rate on the side of the angels, and rallies M. Zola and the rest of the naturalists not altogether unpleasantly. He wishes for one hour of Boileau, and, without entertaining any very great admiration for that censor, it must be granted that it would be pleasant to see him at work with his ferule among *Nana* and *La fille Elisa*, and the rest of the brood. We could promise MM. Zola and de Goncourt "des sensations," as M. Veuillot once put it. Elsewhere M. Chantavoine rallies the Parnassiens, also not without some success. *La Moabite*, however, is a very different piece of work. After reading it, it is scarcely to be wondered at that M. Ferry prohibited it, for it is a direct plea for the Conservative Republic, Liberty *plus* Christianity, and other things for which the author of Article 7 cannot be supposed to be enthusiastic. The prohibition, however, which has, we believe, not prevented the production of the play elsewhere than at the Français, is a curious additional commentary on the actual liberty which France enjoys at the moment. *La Moabite* is full of the movement and colour of *drame*, but its versification, though vigorous enough, is in some respects of the older and pre-Hugonic stamp. The plot is simple, but effective. A Moabite girl, Kozby, falls in love with Misael, the son of the high priest Shamgar, and encourages him to disregard his mother's and father's reproaches at his union with a heathen, by preaching to him the doctrine of "follow your instincts." He embraces this only too fully, throws himself into a movement of revolt, murders the Prophet Elias, that he may himself assume the direction of it, is false to Kozby, ambition having supplanted love in his unmuzzled spirit. Kozby, furious at this, denounces the plot. The murder of Elias and the divulging of Misael's despotic projects cause a schism in his supporters. Finally, challenging his father to enter the Holy of Holies with him as a test of the truth or falsity of belief in Jehovah, he is struck dead. The subject, of course, would in England be considered quite out of the range of stage representation; but the religious drama, often as it has changed its form, has never lost its hold on the French theatre.

We do not find in this month's novels any trace of that coming man who is very urgently required in this department of French literature. M. Valery Vernier's book (24) is a good piece of journey work, but not much more. *L'amour au Pays Bleu* (25) is one of the essays in local colour—very local colour and a great deal of it—which have become fashionable in France, and for which Algeria offers abundant material. M. de Létorière's stories (26) are tolerable—of their kind. *Jeunesse* (27) is one of those not infrequent studies of French provincial manners which make humble readers of Mr. Matthew Arnold lose themselves in complicated problems of mental arithmetic as to the respective advantages of Philistinism accompanied by morality, and of immorality accompanied by rather greater Philistinism. *Le capitaine Bric-à-brac* (28) would probably not have been written if *La cousine Bette* had never existed; but the author deserves some credit for careful arrangement of his scenery and accessories. *Serge Panine* (29) is to be fathered rather on M. Feuillet than on Balzac, though some not inconsiderable tinge of the latter is also observable in it. It is rather curious that, though the mere workmanship is often better in the average French novel than in the English one, it follows certain accepted types even more slavishly than is the case with English fiction.

IRELAND.

NO charge can be more unfounded than the complaint that Mr. PARNELL's demands are too vague to be readily accepted or rejected. The affectation of treating revolution as a variety of reform is a result of mere timidity. In his speech at Waterford Mr. PARNELL advanced beyond the position which he had previously occupied. The claim of occupying tenants to retain the land in perpetuity, on payment or promise of a rent to be fixed by themselves, was sufficiently bold. The rule according to which the rent is to be assessed has been frequently announced by Mr. PARNELL or his associates. GRIFFITH's valuation has only been proposed as a standard because it is in most cases far below the stipulated rent and the market price of the land. Wherever it happens that the valuation is equal to the agreed rent, the tenants have refused to pay it. The demagogues tell the people that out of the produce of the land they must in the first instance maintain themselves and their families in comfort. The second charge is to be the payment of debts to the shopkeepers, who might perhaps otherwise withhold credit. Finally, if any margin is left, the occupier may allow to the landlord any part of the surplus which he may think just or convenient. While such doctrines are preached, English partisans still prattle about the rejection of the Disturbance Bill which purported to provide for temporary distress; although Mr. A. W. PEEL candidly acknowledges, with a frankness that may be inconvenient to some of his colleagues, that, "even if the House "of Lords had not rejected it, the outrages that have since "happened would still have occurred." There is now no distress in Ireland; and the Bill in which the Disturbance measure was originally included as a clause would not have been introduced if the present condition of the country had been foreseen. It is probable that the Government will propose to give fixity of tenure to the actual occupiers of land; but Mr. PARNELL has already proposed a much more ambitious scheme. For his own purposes he now admits that population is too dense in Connaught to be effectually secured against distress even by ownership of land. He accordingly agrees with the advocates of emigration; but not to the colonies—of which, indeed, he declines to recognize the existence—nor even to the United States. Professing to know America well, Mr. PARNELL boldly asserts that there are no parts of the New World so well adapted to settlement as the pasture lands of Ireland. He therefore announces that the owners or lessees of grazing lands must make room for small cultivators, who will grow potatoes instead of rearing or feeding cattle. Fixity of tenure is in this case to include a transfer of property to absolute strangers. The machinery of the Land League, which is sometimes hypocritically described as constitutional agitation, will be equally applicable to a new project of robbery. Mr. PARNELL announces that during the ensuing year neither owners nor tenants will be allowed to graze cattle on their pastures, in the expectation that the proprietors will be compelled to let or sell their lands to cottage occupiers.

In another part of his speech Mr. PARNELL quoted Mr. GIBSON's statement that there are now few outrages in Mayo and in Galway. Here, said Mr. PARNELL, was an admission that the organization of the Land League supersedes the practice of assault, of mutilation of cattle, and of murder. Mr. GIBSON had explained that the establishment of an anarchic despotism was now complete. If the landlords of Mayo are deprived of their property, if farmers and labourers are compelled to obey the dictates of the League, it is not to be supposed that threats or violence will be ordinarily used to compel a submission which has already been fully enforced. If all the houses in Belgravia and South Kensington were in the possession of burglars, and if the police were not allowed to interfere, there would in those districts be no need for the use of jemmies or revolvers. Triumphant crime can afford to disregard the use of the instruments by which success was achieved. Elsewhere there is no abatement of cruelty and oppression. At Waterford itself the opponents of the grant of the freedom of the city to Mr. PARNELL were coerced by threats, and the windows of those who declined to illuminate their houses in his honour were broken. Agrarian outrages in other counties, if not in Mayo and Galway, have never been more rife. One ordinary occurrence, described by a correspondent of the *Daily News* who had personally investigated the circumstances, produces perhaps a stronger impression than a general enumeration of many similar crimes. A poor man whose ears had been mutilated minutely described the proceeding to the English stranger, though he kept up the fiction of pretending not to have recognized the perpetrators of the outrage. In Dublin, and even in London, Irishmen who have committed no offence except in owning land are now living under the protection of the police. The agents or accomplices of the Land League audaciously extend their machinations to the country which also submits the choice of several representatives to its professed enemies. In this state of affairs Irish agitators, some of them members of Parliament, have the impudence to assert that the reports of outrages have been invented by English newspaper correspondents. The apologists of crime scarcely condescend to explain away the reign of terror which, according to their statements, has neither motive nor foundation.

The Radical party still contends that remedial measures alone are calculated to suppress disorder by abolishing its causes; yet it might be supposed that the establishment of security for life and property would be prior in time, as in logical sequence, to any tentative project of law. There is no reason to fear that any English Government will by Act of Parliament transfer the ownership of land to the occupier, except on the condition of paying either purchase-money or rent. It is also for economical reasons impossible to buy up the fee-simple of the land, even if the owners were willing to sell. A fair rent, however it may be ascertained, must after all be a rent; but, if the principles and practice of the Land League are allowed to prevail, there can be no security for the payment of even the smallest rent. Mr. PARNELL, as long as there is neither law nor government in Ireland, will proceed without impediment to the attainment of his avowed objects. There are, as he calculates, 500,000 persons in Ireland anxious to maintain the English connexion because they are directly or indirectly interested in the ownership of land. All the respectable classes, including a large part of the population of Ulster, might be added to the list; but the statistics are for the present purpose comparatively unimportant. If the proceedings of the Land League are not checked, the friends of England will be beggared; and if the conspiracy will be susceptible of

suppression when a Land Bill is introduced, it might much more easily have been crushed before it attained its present dimensions. The enemies of order have been deliberately, and for reasons of party convenience, allowed to organize, to arm, and to reduce large districts of the country to panic-stricken obedience. Any measure which may tend to repair the mischief which has been done might much more effectually have prevented it. The tardy and futile Circular which Mr. FORSTER has just issued to the Irish magistracy, enumerating the legal powers which they have no longer the means of seriously exercising, comes too late to serve any useful purpose.

There is some force in the representation of Liberal apologists that it is not for the interest of the country that the dissensions which exist in the party and in the Cabinet should issue in open rupture. The result would be the accession to office of a purely Radical Government, which might probably afterwards provoke its own defeat by the extravagance of its projects. A coalition in office of Conservatives and moderate Liberals would then be encountered by an unscrupulous Opposition, acting probably in close alliance with the Irish demagogues. The continuance of the present Ministry in office is preferable to the probable consequences of a change. It seems indeed incredible that there should not be some explanation of conduct which, in default of fuller knowledge, seems to all reasonable politicians equally criminal and insane. COLERIDGE propounded a rule of criticism to the effect that till a man understands an author's ignorance, he should presume himself ignorant of his understanding. No outside observer can understand why even Mr. BRIGHT and Mr. CHAMBERLAIN should have laid down as the condition of their retaining office the toleration for several months of barbarous cruelty, of terror, and of spoliation. It is true that Mr. PARNELL rewards them by the generous admission that there are two good Cabinet Ministers; but both of them are undoubtedly indifferent to his questionable compliment. Mr. FORSTER, notwithstanding the passionate weakness of his conduct during the last Session, is an honest and an able man. Mr. GLADSTONE himself does what he thinks right, though he unfortunately is too prone to believe that whatever he is inclined to do is right. The Ministers, as a body, are men of ability and high character; and nearly all of them must be averse to anarchy. Their passive complicity with the worst offenders must be founded on some kind of cause or motive. They probably, and perhaps rightly, think that their continuance in office is for the interest of the State. Any competitors who wish for personal reasons to take their places must be not only selfish, but crazy.

MARSHAL MANTEUFFEL.

MARSHAL MANTEUFFEL has given a summary of the aims he has in view, the difficulties he has to encounter, and the progress he has made, as Governor of Alsace-Lorraine. He has got together a Provincial Assembly, which is no doubt respectable, but which is regarded with cold disapproval by the chief men in the country, and to which Strasburg refuses to send any representatives. He constantly impresses on every Alsatian or every Lorrainer with whom he has to deal that they must look on the cession of their territory to Germany as irreversible. The beginning of everything is that the inhabitants of the provinces should look on themselves as once for all Germans. But, if they will but be good Germans, then, so far as depends on him, they shall be happy Germans. He finds that they wish, so far as they condescend to wish for anything from him, that their local constitution should be made more definite and more comprehensive. With this wish he is quite ready to comply to the utmost of his power. If he can but achieve what he and they want, he will return home with a good conscience. And, whatever else he may have done, or failed to do, he has inspired the inhabitants with a belief that he personally is their friend, that he is at once kind and just, that he has large powers accorded him, and that anything he recommends will probably be given them. He has personally gone all over the territory confided to his charge, has conversed freely with men of all parties, has listened to all complaints, and has received with respectful attention the statement of opinions entirely adverse to his own policy. Nor does he deceive himself as to the impression he has made. Those who have agreed to join in the creation of a local constitution have done so wringing their hands with tears in their eyes, so painful has it been to them to separate themselves from old traditions and to work with those whom they still look on as conquerors. To his regret he also found that he came in contact with people whom no arguments could convince and no persuasions soothe, and whose only reply is that in their hearts they still feel themselves to be Frenchmen. He is sometimes a little encouraged, more frequently disappointed, and owns that he has always to be going uphill and very slowly. But there are two things to which he trusts for obtaining by degrees a better result. These are his own good intentions, and his intentions, he declares, are the intentions of the EMPEROR. He has been expressly directed to show that he can appreciate and respect the sentiments of a people which has been unduly and suddenly forced to break away from a nation with which it has been for two centuries connected. He has none of the illusions so widely spread through Germany at the time of the war, and based on the belief that the Alsatians looked on these two centuries as a painful episode in their real history, and were panting for the day when they would be restored to the Fatherland. Then there is the general mode in which Alsace-Lorraine is regarded by the heads of Germany. What they wish, above all things, is that the provinces should not be held as a conquered country. What they wish them to be is a territory held for military purposes. The first thing is to see that they are held so that these military purposes are properly carried out. Then, a territory so held must belong to some one. It cannot be independent. It must have the coinage, the laws, and the liability to military conscription of those who are using it for what they consider necessary and just objects. But, when once these objects are attained, when the provinces have been made to offer an unassailable frontier, when in certain large matters the provincials have been marked as belonging to Germany, then the Germans are quite willing to leave them to themselves, and let them still be Alsace-Lorrainers, and not copies of Badeners or Bavarians.

It is not difficult to plan such a programme, but the man who has to put it in execution finds at every turn how hard it is in politics to descend from the general to the particular. Whatever he does is sure to be attacked from some quarter. There is, according to German ideas, a large liberty of the press allowed in Alsace-Lorraine, and the press criticizes with bitterness everything the MARSHAL does. But the main current of adverse criticism comes from German sources. He is not nearly German enough to please the hard and bitter spirit which many of the conquering race display. The German newcomers into Alsace-Lorraine think him far too indulgent to the provincials. They accuse him of being at enmity with the German local officials. The MARSHAL says that this accusation is totally untrue. He has no differences with his subordinates. And in one sense, no doubt, this is a perfectly correct statement. German subordinates are far too well drilled and far too anxious to keep their posts to rebel against a Marshal and a Governor. They do what they are told to do; but they nurse secret grievances, and naturally resent an order so distasteful to the German official mind as the order to be courteous and conciliatory. What they cannot say, their friends in the press say for them. Then the terror of the great BISMARCK is held over the MARSHAL's head. It is alleged that his policy is on the face of it not a Bismarckian policy. There is nothing violent, high-handed, or frankly brutal about it. On general grounds the critics of the MARSHAL are sure that the CHANCELLOR must disapprove of any one who goes on in a way which he would never adopt himself. The MARSHAL flatly contradicts the allegation. He is on excellent terms with Prince BISMARCK, and works in harmony with the chief of Germany. But here again, although it may be very true that Prince BISMARCK acquiesces in a policy of leniency towards Alsace-Lorraine, and is wise enough to see that, in special circumstances, there must be a departure from his ordinary policy, the fact remains that it is a departure from his ordinary policy to be kind and patient, and to foster local independence. Ardent Germans may be excused for calculating that a good day will come to them before long, and that their BISMARCK will show himself to be the same everywhere. Marshal MANTEUFFEL has won over the Bishop of STRASBURG, from whom he derives very valuable support,

and whom he treats with affection and respect. His German critics ask whether this is in the proper spirit of the struggle for culture; and whether it is decent in a high German official to be friendly with an ecclesiastic? The MARSHAL replies that he yields to no German in the determination that the Church shall not encroach on the State, but that he is proud to be, and intends to remain, on the best possible terms with any ecclesiastic who will work with him. Lastly, the Germans complain that the MARSHAL listens to applications for redress and help made by those who openly declare they are not reconciled to Germany. Here the MARSHAL puts down his foot, and puts it down firmly. When it is justice that is asked for, he has not stopped, and never will stop, to inquire what are the personal opinions of the applicant. If there are good grounds for treating the applicant well, the MARSHAL will treat him well, although he may be disaffected to German rule.

It is not surprising that, so far as the provincials are becoming reconciled to this rule, the process should go on very slowly. Men and women cannot change the feelings and habits of a lifetime; and the higher they are in society the greater is their pride in not changing. Then it must strike the provincials that all this German criticism on the MARSHAL may indicate that the governorship of this good Governor is, after all, a happy accident. The MARSHAL will go, but the Germans will remain, and those who remain will be the people who will persistently say that an honest Bismarckian policy is the right thing, that disaffected persons ought not to expect justice, and that it is painful, and almost revolting, to see a German official on friendly terms with a Bishop. And then the Alsatians find it hard to begin at the beginning, and to allow that they must be for ever Germans. They may secretly nourish the dreams or previsions to which M. GAMBETTA gave expression at Cherbourg. The generation of to-day can only do its duty in the circumstances in which it is placed, but there is a larger and higher justice behind the scenes which will play its part on behalf of those who wait. This speech was received in Germany with far too much of panic and exaggerated timidity. But it unquestionably tended to make the position of Marshal MANTEUFFEL more difficult. It cannot have been easy for an Alsatian to read it without thinking that what M. GAMBETTA had dreamt he also might dream. And a local incident has occurred which must point the thoughts of Alsatians in the same direction. A French revenue officer, who acted as the agent of an Insurance office, who moved in the best local society, and was on a footing of intimate acquaintance with many German officers, has been sentenced to three years' imprisonment for having communicated to the French Government plans of the fortress of Diedenhofen. There is nothing extraordinary in a neighbouring Government wishing to obtain details as to the military strength of Germany; and it is notorious that for years before war broke out in 1870 Germans had been employed in every part of France to furnish every information that could by any possibility be of use to an invading army. But it must stir the hearts of the disaffected in Alsace-Lorraine to learn that there are Frenchmen willing to run a great risk in order to communicate information about the fortresses which overshadow the provinces, and that the French Government thinks it worth while to procure and to pay for such information. The real difficulty which the MARSHAL has to encounter is that of making his provincials believe, what neither Frenchmen nor Germans really believe, that the ownership of the provinces has been decided once for all; and this is a difficulty which must create a serious obstacle in the way of that good and honest and generous work to which he personally is devoting himself.

END OF THE NAVAL DEMONSTRATION.

THE naval demonstration now at an end will continue to be a subject of controversy till a party dispute is superseded by newer and more interesting subjects of discussion. When it was first devised, Turkish diplomacy had succeeded in imposing on all the Powers. The Albanians were supposed to offer a serious obstacle to the cession of Dulcigno, especially as the SULTAN was thought to be afraid of his own Albanian bodyguards. The combined squadron was intended at the same time to impress the Turkish Government with respect for the concert of Europe, and to intimidate the local chiefs who might perhaps not be aware that some of the Powers had resolved not to fire a gun, and that none of them thought of landing troops. The commander of the Turkish troops in the neighbourhood felt, or affected, invincible repugnance to any collision with faithful subjects of his sovereign; and at last a Note was published at Constantinople which contained a scarcely veiled rejection of all the demands of the Powers. Immediately afterwards the policy of defiance was suddenly abandoned in consequence, according to Lord GRANVILLE, of his proposal to intercept the revenues of Smyrna, or, if the unanimous statement of German and Austrian writers may be believed, in deference to representations made by Prince BISMARCK through the Ambassador, Count HATZFELDT. The question whether the English or the German version is correct still possesses practical importance. If the Turkish Government yielded to a threat of violence, the menace may be repeated with effect for the purpose of obtaining other concessions. The alleged intervention of Germany, on the other hand, purports to have been friendly; and it is thought to have been accompanied by assurances that no further coercion would be applied. The abnormal measure of occupying the port of Smyrna would have involved the dissolution of the European concert, for Germany and Austria, and probably France, would have withheld their co-operation. It is possible that a disagreement among his formidable advisers might have been regarded by the SULTAN as an equivalent for hostile proceedings on the part of England and Russia. It is admitted by all the disputants that the cruise of the combined squadron in the Adriatic contributed but indirectly to the trivial result of the late negotiations. It has at most illustrated the possibility of European concert, and also its fragility. The Turkish diplomatists have scarcely received the credit which they deserve for their ingenious fiction of Albanian patriotism. As soon as they finally determined to comply with the demands of the Powers, a capable commander was ordered to suppress local opposition; and he accomplished his task without serious opposition. It is to be regretted that some loss of life was caused by the belief of the local chiefs that they had at any time been intended to resist in earnest; but, on the whole, all parties, including the Albanians, seem to be well satisfied. The Prince of MONTENEGRO has with prudent laxity released some Mahometans who were in custody on the charge of a plot to deliver Podgoritza to the Albanians or the Turks. The feuds in that disturbed region have seldom been less active than now.

As something has been done, though the result was ludicrously small in proportion to the machinery employed, the English Government endeavoured to induce its late allies to solve by the same method a more important question. All the other Powers, with the exception of Russia, refused to concur in the project of transferring the operations of the fleet to the Ægean. The contingent squadrons have already sailed in various directions, and there is no reason to believe that they will at any future time reunite. Nearly all the Governments have lately urged on the Greeks the expediency of deferring the conflict for which they have been actively preparing. Official refusals to comply with their advice must not be understood as necessarily final. The KING of the HELLENES and his Ministers must be aware that they use a dangerous and undignified argument when they assert that revolution at home would be the alternative of aggressive war. A nation, like a private litigant, is estopped from taking advantage of its own wrong, or, as in this instance, of its own alleged weakness or anarchy. An intelligent population cannot but be sensible of its inferiority in military resources to an enemy who may perhaps not wait to be attacked. It is improbable, though not impossible, that a Greek army might succeed in acquiring forcible possession of the territory in dispute. A disastrous repulse would be as perilous to the Government of Athens as a judicious hesitation which would be rightly attributed to prudent regard for friendly counsels. It is true that Greece has the exceptional advantage of security from retaliation. No Turkish army will be allowed to reconquer, or perhaps to invade, the territory which was liberated in the War of Independence, nor is there reason to fear a bombardment of the Piræus; but a crushing defeat incurred in Thessaly or Epirus might indefinitely postpone the aggrandizement which the nation confidently expects. If Greek patriots examine the published statements of

their friends in London, they will find that the Greek Committee, while it excuses their impatience, virtually advises them to acquiesce in their present helplessness. Lord ROSEBERY is a clever and versatile speaker, and he is a devoted follower of Mr. GLADSTONE; but he could suggest no ground of confidence to the Greeks, except that the present English Ministry included many friends of their cause. No weight can be attached to Mr. CHAMBERLAIN's vague assertion that, if the Greeks went to war, they would not stand alone. New comers into high office sometimes forget that they have left situations of "greater freedom and less responsibility."

Unfriendly critics of Mr. GLADSTONE's novel policy point out with perfect accuracy the distinction between the demand for the cession of Dulcigno, which was founded on the Treaty of Berlin, and the claim to Janina, which was recommended by a subsequent Conference in accordance with a protocol annexed to the treaty. The Turks were parties to the treaty; but they were in no way bound either by the protocol or by the decrees of the Conference. If international jurisprudence resembled municipal law, the case of Greece would be absolutely untenable; but the nominal equality of independence of sovereign States affords no security against the dictation of Governments which are armed with irresistible force. For many years after the Congress of Vienna, the Five Great Powers exercised an undisputed control over the affairs of Europe when they were agreed, and some of them often interfered in alien contentions without the assent, but also in default of the opposition, of the remainder. If the late parties to the naval demonstration were agreed in a determination to give Janina to Greece, it would be useless to prove that no treaty gave them a right to interfere. The protocol of Berlin, though it was really appended to the treaty in compliment to M. WADDINGTON, virtually assumed the right of the Great Powers to dispose of Turkish territory at their pleasure. The same pretension was more distinctly advanced when the Berlin Conference of the present year defined a frontier for the benefit of Greece without any commission from the Turkish Government, and in disregard of its protest. If Germany, Austria, and France had acceded to Mr. GLADSTONE's recent proposals, they would have acted in strict consistency with their participation in the Conference of Berlin. Whether they had or had not a right to arbitrate, they would have committed no further usurpation by executing their award.

The precedents for intervention are numerous, though many of them have not been generally approved. The despotic sovereigns who were popularly believed to form a Holy Alliance supported or sanctioned the suppression of the Neapolitan revolution by Austria in 1821, and the restoration of absolute government in Spain by the Duke of ANGOULÊME's army in 1824. At a later period France, with the concurrence of England, made war on Holland for the purpose of establishing the independence of Belgium, although both Governments were parties to the treaty which guaranteed the Kingdom of the United Netherlands. Lord PALMERSTON's Quadruple Alliance for the maintenance of constitutional government in Spain and Portugal had no justification except the assumed right of powerful States to regulate for professedly benevolent purposes the affairs of their weaker neighbours. NAPOLEON III., with his semi-official maps of a reconstructed Europe, and with his more disastrous Mexican expedition, carried the practice of officious dictation to an extreme. Mr. GLADSTONE's project of liberating a considerable Greek population from Turkish sovereignty is perhaps as judiciously benevolent as any of the analogous schemes of his predecessors at home and abroad. If he could have induced his allies to co-operate in the execution of his plans as well as in the approval of his objects, he would have been enabled to use the conclusive argument of irresistible force. On the other hand, it may be doubted whether even Mr. GLADSTONE's popularity would be proof against the dissatisfaction which might be caused by an unprovoked attack upon Turkey in concert with Russia alone. Adventures which were readily tolerated in Lord PALMERSTON's time would be scarcely compatible with the virtuous and pacific sentiments of Liberals in the present day.

ENGLISH FARMERS.

MR. READ, who was for many years member for East Norfolk, who has large personal experience as a farmer, and who lately visited the United States to report to the English Government on American agriculture, has this week addressed to his brother farmers a lively and pleasant discourse which is in many ways worth the consideration, not only of farmers themselves, but of the very many persons who are interested in the present and future of English agriculture. The main conclusions which he wished to enforce are short and simple. The English grower of grain and cattle has no competition to fear except that of the United States. Continental States, with their heavy taxation, their ruinous armies, and their exhausted soil, cannot undersell the English farmer. But the American can compete successfully, first, because he has a very large amount of virgin soil at his command, and secondly, because he is a wonderfully sharp, industrious, and practical man. There are, however, limits to his power of competition. Do what he may, he cannot grow wheat under 24*s*. a quarter, if he is to get a profit for himself. The cost of transit from the Western States to Liverpool cannot be put below 16*s*. a quarter. Therefore wheat must fetch 40*s*. a quarter when landed at Liverpool if it is to pay the American grower. Further, although the amount of virgin wheat land in the States is very large, it is not boundless, and the American farmer soon exhausts the land he occupies with his four wheat crops running and his habit of never manuring. Mr. READ gives the American farmer twenty-five years to exhaust the soil available for wheat, after which time he will be obliged to use some kind of dressing, and his expenses will increase. It is impossible to examine how far Mr. READ is right in his conclusions. We must take them for what they are—the conclusions of an experienced and practical man, having exceptionally good opportunities of inquiry. For twenty-five years, then, the English farmer will see wheat kept down by American competition to a point which may exceed, but cannot long fall below, 40*s*. a quarter. There is, again, and will be, American competition in cheese, butter, and bacon. But the American articles of this description are not good of their kind. American bacon is pretty good, American cheese is not good, and American butter is so bad that it can hardly be called butter at all. In beef the American competition will, according to Mr. READ, be most serious and most permanent. The Americans cannot compete in mutton; but when sufficient ingenuity has been applied to conveying and storing the meat, they will be able to give us fine beef in Liverpool at sixpence a pound. Mr. READ did not explain what he exactly meant by fine beef. He probably does not mean that the best American beef will ever be equal to the best home-grown beef. There will always be a fancy article in the way of beef for which Englishmen will pay a fancy price. But the English farmer will have to meet a competition which will give beef of all but the best kind at 6*d*. a pound. American wheat at 40*s*., and good American beef at 6*d*. a pound, is the best and the worst that the English farmer has to face.

But the point on which Mr. READ insisted most strongly was that the American competition is successful not only because the natural resources of the States are very great, but also because the American farmer is a different sort of man from the English farmer, and leads a very different sort of life. He is much more alive, he has received a better education of a modest kind, he is not overshadowed by living in the midst of a luxurious, indolent, and refined society. He is always brooding over what novelties he can invent or adopt. And then he leads a very hard life. He gets up at some unearthly hour which Mr. READ does not specify, but which enables him to breakfast at five o'clock. He never sports; he drinks nothing but what Mr. READ calls "filthy tea"; he dresses in the meanest way; and his only relaxation is to read. If Englishmen are to compete with him, Mr. READ tells them that they must go and do likewise. Let us suppose that this is true, and it is easy to see what a revolution in English farming is contemplated. The present race of farmers must disappear and make way for a new race. It has been supposed to be a reproach to English farmers that they have hunted and shot and had pianos for their daughters. Why should they not have gratified their tastes and attained this humble

degree of refinement? They were for the most part men of capital, who embarked that capital in a channel which promised to give them a fair return, a country life, country pleasures, and a home which, according to the standard of their class, was very comfortable and somewhat refined. They are now told that their capital will no longer give them these things, and they will obviously not put their capital into the channel of farming. Why should a man with 10,000*l.* choose to invest in an enterprise which will force him to rise in winter many hours before the sun, never look at the hounds, drink filthy tea, and go about dressed like the Irishman of comedy? None but men inured to the discomforts of humble homes and possessed of very moderate means would go through such a life, with nothing to tempt them but the chance of just holding their own against American competition. Then all this attention to details, all this personal self-sacrifice, all this minute unflagging supervision can only be profitably exercised if the sphere of operations is limited. The farms which such men can make pay must be small farms, and they will be worked by men of small capital, for men of means will not take up so distasteful a calling. The farmer of the future will therefore be very unlike the farmer of the present. He will be a man a little above a day labourer, who has saved, or can borrow, a few hundred pounds, and who will be willing to lead a hard, dull, penurious life in order that he may earn a moderate competence.

Whether the farmers of the future will be of this type it is impossible as yet to say. We are in a period of transition, and we do not know, and cannot know at present, in what direction we are moving. But there are some general propositions as to the future of English land which may be considered as indisputable. English land will always be cultivated, and will, in the long run, be cultivated at a profit. Whatever may be the conditions under which it is practically found to be cultivated at a profit, those conditions will ultimately be accepted. Legislation can only smooth the path of an irresistible process. It may quicken the flow of land into the market by enlarging the selling powers of tenants for life. It may cheapen conveyancing; and Liberal speakers at agricultural meetings seem to ignore the fact that Lord CAIRNS before he left office brought in very sweeping Bills for the accomplishment of those objects. Legislation may lighten the burden of agricultural taxation, or may secure the farmer in his claim for improvements. But the end of all these things will be independent of legislation. Natural selection will determine what kind of farmer is fittest to survive. Experience will show what are the products to which cultivation can be most successfully directed. If, as some people think, it would pay to grow square miles of cauliflowers, square miles of cauliflowers will be grown. If the farmer who gets up before dawn, and drinks filthy tea, will only embark on his enterprise with a long lease and favourable covenants, he will get his lease and his covenants. If the sense of ownership could spur a cultivator to get up still earlier and to drink a still more repulsive drink, the poor man will buy land. Otherwise he will not buy or will not keep what he has bought. The rent that will be paid will be that which the tenant can afford to pay, neither less nor more. It is obvious, however, that as all transition brings suffering to some one, the landlords will be the first and the chief sufferers. The rent is the easiest thing into which to cut when a farmer considers whether in the new state of things it will answer to take a farm. While the old style of farmer is being extruded, and the new style has not come into existence, the land will be left on the owners' hands. The selling value of land will temporarily fall, for, as no one exactly knows what is to be the future of land, the buyer is buying a risk. The political importance, too, of great landowners has been lessened by the Ballot, although their social importance remains, and there is perhaps less temptation to great landowners to rival each other in the purchase of land. But in time, when things have settled into a new shape, and when it has been discovered how English land can be made to yield a profit in the face of foreign competition, both rents and the selling value of land will probably rise. Competition at home will lower the margin of profit at which the new kind of farmer will be content to work, and what the farmer yields the landlord will gain. Not improbably the wish to own land may be increased by the necessity of leading a hard life which ownership would sweeten, and by the desire men would feel to have the liberty which ownership would give them of adapting cultivation to the most profitable uses. Landowners would thus have to sell what many people would be anxious to buy, and the selling value of their property would rise. It may be added that the rate of interest on secure investments is visibly falling; and, directly the future of land is ascertained, there is every prospect of landlords being able materially to lessen the burden of their incumbrances.

THE PRESIDENT'S MESSAGE.

IF the people of the United States were engaged in any political controversy, the Message of an outgoing President to a moribund Congress would be as ineffective a document as a manifesto by an English Minister in a similar condition. It is nevertheless proper that customary forms should be observed; and it matters little whether the annual summary of events and prospects is composed by the actual President or by his equally respectable successor. Mr. HAYES has reason to look back with complacency on his tranquil term of office. As the opposite party has controlled the Legislature, he has not had the opportunity which he seems to have desired of reforming the Civil Service. The elaborate scheme of competitive examinations which Mr. HAYES now recommends to Congress will be quietly laid aside. The party managers who have lately elected his successor retain the old theory that the spoils belong to the victors. In time, perhaps, the frequent repetition of sound doctrine by eminent citizens may induce professional politicians to modify their practice; but whenever office ceases to depend on party claims, it will be difficult to excite interest even in a Presidential election. Even the funds for the contest are in a great measure derived from taxes imposed on the occupants of office, and voluntary contributions from their expectant successors. One or two vicious measures relating to the currency have been carried over the PRESIDENT'S veto; but he has witnessed the steady reduction of the public debt, and during the last year general prosperity has revived throughout all parts of the States. It is not a little to Mr. HAYES'S credit that during his term of office there have been none of the official scandals which disgraced the administration of his predecessor. The direct interference of the PRESIDENT has probably not been required because he had taken the obvious, though novel, precaution of surrounding himself with honest men. His Ministers have, on the whole, commanded general confidence; and Mr. SHERMAN, if he has not returned to specie payments, has seen greenbacks at par, and has conducted with skill and success the operation of discharging large amounts of debt and of reborrowing at a reduced rate of interest. To the PRESIDENT'S Message Mr. SHERMAN contributes the questionable recommendation of a bi-metallic currency. At the instance of owners of silver mines in Nevada, Congress passed an Act requiring a constant coinage of silver, with an arbitrary and inaccurate value in reference to gold. The SECRETARY of the TREASURY now suggests that the relation of the two precious metals shall be readjusted; but he proposes that not only both kinds of coins, but the outstanding greenbacks, shall retain the character of a legal tender. The operation of riding three horses at the same time requires both skill and good fortune. Mr. SHERMAN has been lucky in the price of greenbacks, and he has hitherto, by an ingenious contrivance, kept out of circulation the silver money which he was legally compelled to coin. According to English notions, the PRESIDENT would have pursued a more dignified course in remaining neutral during the election of his successor; but the Americans are the sole judges of the question whether the chief of the Executive Government should be considered the representative of the nation or the head of a party. The experience of a President must, to compare great things with small, in some degree resemble that of a Lord Mayor. He has for the most part lived in comparative obscurity till his accession to office; and when he retires his political career is over. Two or three of Mr. HAYES'S predecessors have attempted to escape from forced inaction by returning to the House of Representatives; but a dethroned sovereign more fitly remains in dignified retirement.

In former times the President's Message was expected

with excitement, if not with curiosity. The Democratic holders of the office before the Civil War not only did their utmost to inflame the jealousy of the Southern States, but also propounded questionable plans for the extension of the national territory into regions adapted to slave cultivation. After the dismemberment of Mexico, the President for the time being generally directed the cupidity of the dominant party to the acquisition of Cuba. It was also customary to insert in every Message one or more passages of defiance to England, even when there was no ostensible cause of quarrel between the two countries. Although the tradition lingers in the office of the Secretary of State, recent Messages have seldom included any irritating matter. The PRESIDENT professes to be satisfied with the present language of the English FOREIGN SECRETARY on the only question in dispute. It is not yet known whether his impression is fully justified by the state of the negotiation. In dealing with domestic topics, Mr. HAYES assumes, as is natural, a cheerful tone. He cannot but exult in the universal prosperity, and his SECRETARY of the TREASURY takes occasion to hold out the hope of a still further reduction in the interest of the Debt. Mr. BRIGHT, with characteristic party prejudice, lately explained the perversity of the United States tariff by the alleged necessity of raising a large revenue to pay the interest of the Debt, and gradually to discharge the principal. It would have been within his knowledge, if it had been his custom to know anything inconsistent with his own prepossessions, that revenue is designedly sacrificed for the sake of protection, and that the administrators who are engaged in the reduction of the Debt are inveterately hostile to the doctrine and practice of Free-trade. Mr. HAYES, as a member of the Republican party, is pledged to the cause of monopoly, and his successor professes the same opinion. The Democratic candidate for the Presidency was eager to guard himself against the charge of holding sound principles, though in his confusion he blundered into language which in some degree resembled Mr. BRIGHT's apology for American delusions.

The only contributions of the SECRETARY of STATE to the Message relate to the Chinese immigration treaty, which has not yet been received, and to the controversy with England arising out of the clause in the Washington Treaty which admitted America to the fishery of Newfoundland. It seems that Lord GRANVILLE's language is deemed more conciliatory than Lord SALISBURY's, but it is improbable that the main contention of the English Government can be abandoned. Lord GRANVILLE is not likely to imitate Mr. EVARTS in the peremptory tone and language which he has inherited from a long series of official predecessors; but he will not be disposed to inflict gross injustice on the fishermen of Newfoundland. It is highly probable that, in protecting themselves against the encroachments of foreigners whom they regard as intruders, they may have been guilty of excess for which compensation will be due. In the so-called Fountain Bay disturbances the tackle of some American fishermen was destroyed, and perhaps some of them may have suffered personal injury. No English Minister will vindicate violence against foreigners who were at the worst asserting a disputed claim; but the protest of the Newfoundland fishermen, though it may have been made in irregular form, seems to have been essentially just. The Washington Treaty gave American fishermen unrestricted access to the waters of Newfoundland; but by a local law the natives were prevented from fishing on Sundays. The Americans refused to be bound by the restriction, and consequently, if their claim had been allowed, they would have enjoyed for one day in the week a monopoly which could never have been contemplated when the treaty was made. In this as in other instances the English negotiators seem never to have thought of guarding any national right or interest; but they were perhaps controlled by peremptory instructions from home. Both parties must have intended that American and Newfoundland fishermen should be placed on an equal footing; but when Lord SALISBURY insisted on the obvious construction of the treaty, Mr. EVARTS thought fit to repel an imaginary pretension to the power of overriding an international engagement by municipal law. If the Colonial Act had been passed after the date of the treaty, Mr. EVARTS would have been in the right; but in that case Lord SALISBURY would not have relied on an untenable argument. If by some old law Frenchmen had been prohibited from killing game in England, and if a recent treaty had conceded to them the privilege, they would, according to Mr. EVARTS's contention, have a right to kill partridges in August and pheasants in September; yet the innovation would be intolerably oppressive to English sportsmen. The PRESIDENT professes satisfaction at the admission of the English Minister that treaty rights are independent of municipal law. He will probably find that Lord GRANVILLE and Lord SALISBURY hold the same opinion, though they may have expressed it in different language. It remains to be seen whether Mr. EVARTS, or his successor, will insist on a wholly unreasonable demand. If the fishery can without inconvenience be suspended for one day in the week, there seems to be no reason why foreigners should not acquiesce in the limitation which the natives of the islands have, for reasons which they deem sufficient, imposed on themselves. It is not in human nature, or in the nature of a seafaring population, to stand by in peace and good-humour while competitors from a distance exercise privileges refused to themselves. It is true that the colonial Legislature can at pleasure remove the restriction; but, if it was in the first instance expedient, it ought to be retained.

SECULAR EDUCATION IN FRANCE.

THE French Chambers are debating by instalments an Education Bill which, in its original form, embraced Universities and schools of every grade. The Government not unnaturally thought that this tremendous meal would be more easily disposed of if it were broken up into courses, and the various Education Bills which have done so much to make M. FERRY famous are parts of the vast whole which a Committee originally proposed to submit to the Chamber of Deputies all at once. During the present Session the Bill making elementary education gratuitous has been voted by the Chamber of Deputies, and is now waiting its turn in the Senate. The constitution of the Second Chamber makes its opinion on this particular proposal unusually important. From the method in which it is elected the Senate specially represents the communes, and the communes are more directly interested in this particular Bill than in any other of the series. Free education, however it is worked, must be a costly business, and the Bill throws the privilege of finding the money upon the communes. Hitherto they have had only the right to tax themselves for educational purposes; in future, if this Bill passes, the right will be transformed into a duty. Inasmuch as only a very small fraction of the communes have used the right accorded to them, it is natural to suppose that they did not greatly value the permission; and this fact suggests a doubt whether they will be altogether pleased with the pressure now to be applied to them. While the Bill was before the Chamber of Deputies an attempt was made to transfer half the burden about to be created to the State, and the Chamber was so far favour of this plan that it consented to take into consideration the amendment embodying it; but, under strong pressure from the Government, the Deputies in the end rejected it, though why they did so is not quite clear. It is easy enough, of course, to understand the objection which the Cabinet had to the proposal. Its members would, indeed, have had no bowels for a colleague's woes if they had not tried to spare the FINANCE MINISTER so serious an addition to the expenditure he is called upon to meet. It is not quite so obvious how they contrived to carry the Chamber along with them. There must be a great number of communes which would very much rather see the burden thrown—to use English equivalents—upon the Consolidated Fund than upon the rates; and when every arrondissement returns a member, local opinion upon local taxation might have been expected to have had greater weight with the Deputies. The Chamber is independent of the Cabinet when it would seem more natural for it to be submissive, and submissive when it would seem more natural for it to be independent. In the Senate, where a large proportion of the members are actually elected by the representatives of the communes, the divisions will be a better indication of local opinion on the subject. The success of the Bill will be a testimony of some value to the real feeling of Frenchmen towards the Church. One of the incidental results of making elementary education free will be to place voluntary schools, where they exist, at a very great disadvantage. We know something in Eng-

land of the competition to which these schools are exposed by the lower fees sometimes charged in Board schools; but a mere occasional reduction of fees is a flea-bite compared with an entire abolition of them. If the French peasantry are really willing to lay an additional tax upon themselves in order to banish the Church from the field of elementary education, it will indicate a nearer approach to active hostility than they have generally been credited with.

The Government are not content with making elementary education free. They further propose that it shall be compulsory and secular. The Bill by which this latter object is to be attained is now before the Chamber of Deputies, though the discussion of it has been suspended in order to make room for the Budget. It was introduced by M. PAUL BERT, in a speech the moderation of which would have seemed less studied if his name had not been associated with an attack of singular violence upon the Jesuits in connexion with the unfortunate 7th Clause. The gist of his argument was that, if education is to be compulsory, it must be secular. How can Protestants or Jews be forced to send their children to Catholic schools? Even the reactionary law of 1850 recognized this necessity in some measure. It made the teaching of religion obligatory, but it contemplated the provision of denominational schools in every commune where there was a non-Catholic place of worship. There are, however, over a thousand communes in which there is a Protestant "temple" but no Protestant school, besides the cases in which the non-Catholic population is too small to enable them to maintain a temple. Even if the law of 1850 gave sufficient protection to the consciences of parents, it would still be shocking to patriotism. Where there are denominational schools children must learn that they are Catholics, or Protestants, or Jews before they learn that they are Frenchmen. Even now the sins of the law of 1850 are not exhausted. As religion must be taught in communal schools, the teachers must be Catholics, and, what is worse, by the interpretation which successive Governments have placed upon the law, they must be good Catholics. Consequently religious questions have been introduced into the examinations which teachers have to pass, and it has even been required that the candidate should know both the letter and the spirit of the catechism. The consequence is that the training schools for teachers have been transformed into seminaries and convents, and the teacher has become the servant of the curé. More than this. M. BERT maintains that in Catholic schools—that is, in the great majority of communal schools—Protestant and Jewish children have been forced to attend Catholic instruction. When many religions are professed in the same country, and it is not possible to provide them all with separate schools, one of two things must happen. The children of the several minorities must be taught the religion of the majority, or religious teaching must be shut out from the school. Catholics themselves recognize this when they are in a minority. In Holland they demand that the elementary teachers shall be silent about religion; whereas the Protestants protest against the exclusion of religion, and maintain—just as the Catholics do in France—that not to teach religion is to teach atheism.

The force of M. BERT's reasoning is beyond dispute; but no one imagines that it is upon arguments of this kind that the controversy really turns. French Catholics are firmly persuaded that the introduction of compulsory and secular education is part of the general attack upon the Church with which the Republican policy has of late been identified. They maintain that, though the Bill leaves the parent free to have his children taught at home, or to send them to a denominational school, these permissions are altogether illusory. Peasants and artisans have neither the time nor the knowledge to teach their children themselves, nor the money to provide them with tutors. They will be obliged to send them to school as the only means of obeying the law. Even if they make an effort to teach them themselves, or accept the offer of some benevolent and Catholic neighbour to teach them, it is doubtful whether they will earn the desired exemption. The Bill provides that every child taught at home shall be annually examined by a Board, which, if it is not satisfied with his progress, will send him to the communal school. The value of the permission to send children to denominational schools is shown by the fact that, out of some 36,000 communes, there are at least 30,000 in which there is only the communal school. Even as regards the remaining 6,000, the Bill gives the Departmental Council power to declare that, in consequence of the insufficiency of the teaching, attendance at a denominational school will not reckon as obedience to the law. The educational position of France is entirely different from that of England, where denominational schools are to be found everywhere, and the balance between them and rate-supported schools is held by an impartial authority. With us the managers of voluntary schools are just as eager in their advocacy of compulsion as the School Boards themselves; but if only one parish in six had a Church school a very different note would perhaps be sounded. It is the same with the proposal to make elementary schools entirely secular. Even in form it goes beyond the English system, while in practice there can be little doubt that it would be very nearly its direct contrary. There are a great number of Board schools in which the religious teaching is not to be distinguished, except in a very few particulars which the children are not likely to notice, from that given in the neighbouring Church school. In France it is proposed to forbid any religious teaching whatever in the communal schools. To use M. BERT's own example, the teacher will not be allowed to say that lying is displeasing to GOD; he must only say that lying is degrading. More than this, the lay teachers will, at all events under the present Republican Government, be for the most part men who have a very bitter hatred of the clergy, and will consequently be disposed to prejudice the children against them. If the Government had only been prompted by zeal for liberty of conscience, they might have borrowed the principle of a Conscience Clause, and have taken some effectual means to protect non-Catholic children against Catholic teaching. A Government with such antecedents as theirs cannot expect not to have its ecclesiastical legislation very closely scrutinized. It is difficult to look at the new educational project without a suspicion that it is the indirect injury it will inflict on Catholicism rather than the direct service it will render to Protestantism that makes it dear to its authors.

THE YOUNG LION OF THE GOVERNMENT.

THE constituency of the Border Burghs is no doubt a highly respectable constituency, but perhaps a very keen sense of the ludicrous would not be attributed to its members by their warmest admirer. "For pleasure, give me Peebles," is a local adage; but even local patriotism has not arrived at the pitch of saying, "For humour, give "me Hawick." Therefore, the speech in which Mr. G. O. TREVELYAN announced to his constituents the important fact that he had accepted "an office of business" in the Ministry that now governs the country probably did not strike the men of Hawick in quite the same light as that in which it strikes some other people. There is a legend of a youthful German student who thus wrote to his friends:—"MATILDA loves me, and I love MATILDA; there-"fore, all is well." Mr. TREVELYAN's utterances on Monday reduce themselves to a similar formula with the greatest ease. Mr. GLADSTONE has invited Mr. TREVELYAN to accept an office of business, and Mr. TREVELYAN has consented to do so; therefore, all is well. Hawick and England may sleep peacefully and calmly, secure of the fact that Mr. TREVELYAN is there. As for Mr. TREVELYAN himself, to do him justice, he seems quite as happy as he thinks the country ought to be, and breaks out into phrases of delight which recall rather the author of *Horace at Athens* than the severe reformer of the present day. To serve under Lord NORTHBROOK, to be Mr. BRASSEY's colleague, to hear the clocks of the department strike as they struck in his youth, all this is almost too much for Mr. TREVELYAN, and he thinks that these delights go to make up "a lot than which it would not be easy to "draw a better in the wheel of fortune." Indeed some of his constituents might have cautioned Mr. TREVELYAN against the well-known danger of being "fey." But it is for his country rather than for himself alone that the member for the Border Burghs rejoices. His entrance into the Ministry—let us put it as complimentarily as we can—is the sign and symbol of many great things. The severe moralist who ten years ago quitted office on a possibly Quixotic scruple would not, the men of Hawick may feel assured, return except under the most solemn pledges of "thorough" from the entire Cabinet. We gather, in-

deed, from Mr. TREVELYAN's fashion of speech, that in all probability he holds a bond signed and countersigned by everybody, from Mr. GLADSTONE down to Mr. CHAMBERLAIN, and promising unlimited reform.

It is of course of considerable importance to the country to understand the import of this document, concerning the contents of which Mr. TREVELYAN was at once encouragingly suggestive and prudently reticent. He had his hand full of the most important truths, but he chose only to open his little finger. Yet even this opening disclosed much matter. The higher ranks of the army may regard their reorganization as a settled thing, for is not Mr. TREVELYAN (we must apologize for the apparent bull) at the Admiralty? As for the county franchise, that is settled, too, by Mr. TREVELYAN's promotion. His own chief, said Mr. TREVELYAN significantly, was pledged to this, and it is evident that he means to keep his own chief up to the mark. He is on the spot, and able to do it; and Lord NORTHBROOK must, we should imagine, have felt a slight shudder steal over him as he read the words the next morning. Even in a wide, though scattered, house like the Admiralty, the perpetual presence of Mr. TREVELYAN keeping one up to the mark must be a little disturbing. Lord GRANVILLE, too, had sworn that the Cabinet would never dissolve till the county householder had his due. We can only suppose from this that Mr. GLADSTONE intends *en cas échéant* to disregard the Septennial Act, and to discover that the ideal Parliament ought to sit for life. Such are the promises, artfully disguised by references to Lord NORTHBROOK and Lord GRANVILLE, which Mr. TREVELYAN holds out to the country; such the benefits which he has obtained by placing his services at the disposal of Ministers. For ten years, he said, he had devoted zeal and time to certain special questions which require somebody to watch them, to undertake the labour of mastering their details, and to force them on the attention of the House of Commons. That time is over; Mr. TREVELYAN's task is done. The wicked and obstructive general is as good as abolished, and the virtuous county householder as good as enfranchised. It must be admitted that the statement conveys a remarkable and almost alarming idea of the powers which are going to be let loose upon us after this ten years' labour. We really hope that Mr. TREVELYAN will not prove himself as troublesome to the Government as familiars have been to MICHAEL SCOTT and other persons famous in story. A man who alone and unaided, without the prestige of office or the assistance of official colleagues, watches two great questions, masters their details, forces them on the attention of the public and the House of Commons, and then magnanimously retires, leaving his nominal superiors to wind the horn of triumph and deal the deathblow to the helpless quarry, is an invaluable, but also a rather terrible, servant. Mr. TREVELYAN has done all this, for he says so. Surely the pleasure of serving Lord NORTHBROOK, the intense delights of Mr. BRASSEY's society, the joy of seeing those officials who taught his infant feet to move in official ways, cannot be expected to occupy and content such a genius as this? No, we may depend upon it that Mr. TREVELYAN will still be doing. Certainly Mr. GLADSTONE has plenty of jobs on hand which for a short time might quiet even this perturbed spirit. Suppose Mr. TREVELYAN were made Irish Secretary, or Ambassador to Constantinople, or Commissioner at the Cape, or Commander-in-Chief of the Forces in India? He would not be so happy as in the society of Mr. BRASSEY, but he would be more useful; and the *mot d'ordre* of the present Ministry, a Ministry of stern probity, is understood to be the tools to the workman. Indeed, it is not quite clear why Mr. TREVELYAN should not unite in his own person two or three of these responsible and difficult offices. He has, by his own confession, driven abreast for ten years the wild horses of Army Reform and Franchise Extension. Surely, then, he might manage, say, Ireland and India, or the Eastern question and the South African question together.

Long association with the electors of Hawick may possibly have dulled Mr. TREVELYAN's once tolerably lively faculties, or it may be that certain inherited peculiarities are making themselves unduly prominent, and that the avuncular "cocksureness" has eaten up the rest. But it is curious that any man accustomed to mix in the world, and to find, if only half-consciously, his level therein, should be able to make such an exhibition of himself as Mr. TREVELYAN made in this remarkable oration. There was more in it, naturally, than the interesting autobiographic revelations on which we have chiefly commented. But it was not a very interesting more. Of course Mr. TREVELYAN gravely rebuked the Opposition critics for their bad language and unchivalrous opposition. Of course he made no reference to the peculiarly handsome language and the peculiarly chivalrous opposition which had characterized his own side a few months ago. Equally of course, he accused the late Ministry of getting us into difficulties in South Africa, as well as in Afghanistan and elsewhere. But these things are the necessary commonplaces of every Government speech. It was more interesting that Mr. TREVELYAN should gravely complain of the levity of his opponents, for, on this head at least, a *tu quoque* is impossible. Few people would have accused Mr. TREVELYAN of levity before Monday last; certainly no one will do so now. He has "made his "proofs," and is entitled to the order and insignia of whatever saint is the patron of those who are hopelessly insensible to the ludicrous figure they cut. A Ministerial vacancy occurs at a time when the Ministry are very anxious to have none but safe seats vacated, and to admit to their body none but adherents who can be depended on in reference to the Irish question. A youngish man, of good ability and position, and of that convenient temper which can be made by a little adroit management to do work that other people do not care to do, is to be had very cheap. By this last expression we need hardly say that we mean nothing more than that Mr. TREVELYAN's place in the Admiralty is not exactly a Secretaryship of State. The place is offered and accepted, and the happy placeman forthwith announces *saturnia regna*, descants on his own unbounded felicity, and gravely publishes the record of his exertions during the past ten years, insinuating that the edifice of these exertions is now going to be crowned by the Cabinet, and that therefore without them the Cabinet would have no edifice to crown. Mr. TREVELYAN is the latest and one of the most pleasing *mouches du coche* that the political entomologist has met with. We are very sorry for Lord NORTHBROOK and Mr. BRASSEY, as well as for the *servum pecus* of officials with whom Mr. TREVELYAN longs to renew his acquaintance. These latter, however, will very likely find means to occupy their young friend, and, as our rude fathers used to say, to stay his stomach for work. But to persons who have no official connexion with the Admiralty Mr. TREVELYAN will be almost an unmixed boon if he goes on in this way. He will be amusing, which he has not been for some dozen years or more, and which but few of his colleagues (we must not say superiors) in the Government have the faculty of being at any time.

SIR RUTHERFORD ALCOCK ON CHINA.

THE Memorandum by Colonel GORDON on the military policy of China is criticized by a highly competent authority, Sir RUTHERFORD ALCOCK, in the current number of the *Contemporary Review*. The point of the comment is that Colonel GORDON's advice is very good, but that it has very little chance of being adopted, and the reason why it will not be adopted is that, to make the defensive policy contemplated by Colonel GORDON practicable, there must be a change of capital. "Nothing will avail the "Chinese, neither their unlimited command of men, the "vastness of the area to be covered or traversed by in-"vaders, nor even ironclads able to engage the fleet of a "foreign Power," while Pekin remains the seat of government. A capital which cannot hope to escape attack, and is at the same time incapable of defence, is a constant source of weakness. The first condition of safety is the removal of the capital to Nankin, "the heart of the "Empire and its true centre"; and this is, apparently, too great a change to be at all likely to be adopted. In any country a transfer of the capital would be a work of immense difficulty, and the difficulty is not likely to be less when the nation which has to surmount it is so conservative in its instincts as the Chinese. Of course, under a sovereign, or even a Minister, of extraordinary force of character, this and every other obstacle might be surmounted. But then the sovereign or the Minister has yet to be found, and it is on the cards, according to Sir RUTHERFORD ALCOCK, that sufficient time may not be left for bringing him to the front. At this moment the Chinese Empire would, he says, be utterly helpless before the attack

of a single European Power. Now it is far from impossible that a European Power may shortly be found to attack her. The relations between China and Russia have for some time back been exceedingly unfriendly, and where the relations of Russia with her Asiatic neighbours are unfriendly, war is seldom very far off. Russia might even be tempted to do more than she intended by the success of her first measures. Sir RUTHERFORD ALCOCK seems to think that at the first shock of a Russian invasion the Chinese Empire might fall to pieces, and a national convulsion follow, "to which nothing in Europe can supply a "parallel." Whether Russia is inclined towards such an invasion is difficult to say, but it is easy to conceive circumstances in which the temptation to undertake it would be very great. China affords a more promising field for superfluous Russian energy than either Southern Europe or Central Asia. Nearly everything that can be supposed to make India attractive is equally possessed by China, with the very great additional recommendation that there is no English army stationed on the other side of the frontier. If Russia finds her European ambition likely to yield no fruit, and any dreams she may have of a descent upon India dashed by the thought of the resistance with which it will be met, she may come, by a very natural process, to give the invasion of China a very prominent place in her thoughts. On the morrow of a great victory all the eighteen provinces of China might lie at the mercy of the conqueror, and though even Russia might hesitate before adding three hundred millions of human beings to her Empire, she might not be unwilling to begin a process of absorption which might be followed up by degrees as opportunity and leisure should offer.

This is not, however, the way in which Sir RUTHERFORD ALCOCK looks to see the aggrandizement of Russia in this direction brought about. China may cede territory before defeat, instead of after it. Her rulers may be so well satisfied of the result of an invasion that their one idea may be to avert it. There are two ways, according to Sir RUTHERFORD ALCOCK, in which Russia may conceivably be propitiated. One is by the cession of Corea, the other is by the entire surrender of the Chinese claims upon Kuldja. Whatever may be the precise value of this province to Russia, there can be little question that a cession of it, made in order to avoid an invasion, would give Russia a preponderating influence at the Court of Pekin. When territory has once changed hands under these conditions, the threat and the mode of averting it are pretty sure to be resorted to again. Indeed the mere consciousness that they can be resorted to may easily answer every purpose. When once the relative strength of the two neighbours has been mutually appreciated, the one may abstain from taking possession of territory which he knows may be his whenever he likes to seize it, while the other is careful not to offer resistance which he knows will have to be atoned for by solid sacrifices. In this way the influence of the stronger Power over the weaker may be completely established without any startling rearrangement of frontier. The tribute is exacted in the shape of control, and paid in the shape of submission. A new consideration has lately come into play to which at present it is impossible, from want of information, to assign its just value. The Chinese Government has apparently consented to allow the United States to treat the question of Chinese emigration as one of mere municipal administration. Consequently the United States Government will not have to answer to China for the expulsion of Chinese settlers. When they are driven from America, they will come back to their own country, and find no one to take up their cause or vindicate their right to live in America with as little molestation as Americans encounter in the Treaty ports of China. There are two aspects of this arrangement which may affect the relations of Russia and China. One is the consideration given for this concession. The Chinese Government can hardly have surrendered a treaty right without receiving something in exchange. The other is the fact that the shutting up of the Chinese within their own frontier may affect in quite unforeseen ways their relations with Russia. Supposing, for example, that they swarm over into the disputed provinces, they may make it less easy for Russia to hold them without some unmistakable show of strength. The choice between protection and conquest—terms so far removed in their apparent, so near allied in their real, meaning—might easily be determined by the treatment accorded to a band of settlers who, but for Californian hostility to cheap labour, would have lived and died under the flag of the United States.

Sir RUTHERFORD ALCOCK justly remarks that the possible interest of these contingencies to England is very great. The annexation of Corea would bring Russia very near to the southern end of Japan, "with its unfrozen harbours of "admirable capacities." The direct extension of Russian influence over China, whether in the shape of territorial extension or of a protectorate, might have serious consequences as regards India. In either case Russia would command the aid of the vast Chinese army, which, though not formidable in its present, undisciplined and unorganized condition, is nevertheless capable of being turned to excellent account in European hands. China includes among her tributary States Nepaul, Bhootan, and Burmah; and Sir RUTHERFORD ALCOCK has certainly some ground for saying that, "if, instead of the Manchu "Emperor in Pekin, we had a Great White Khan acting "the part of suzerain over all these semi-barbarous "tributaries of China, such a revolution might render our "position in India more precarious than it has ever yet "been." Nepaul is admirably placed for the purposes of an invader who is able to use it as his base, since, once there, he would have nothing between him and Calcutta but a level plain and unfortified towns. The fact that the Russian army in these regions was composed of Chinese, and not of Russians, would only make it more dreaded. In Asia, east of the Caspian, China has "an unbroken "tradition of a thousand years." The perennial flow, the devastating march, the terrible persistency, the endless numbers of the Chinese armies are "indelibly written on "the tablets of the Asiatic mind."

Of course these contingencies, even if not entirely unreal, are remote; but after the remarkable progress that Russia has made in Central Asia, it seems idle to suppose that she can be blind to the far greater advantages which she might derive from establishing a protectorate over China. She would then be virtually conterminous with India in a more real sense than she could ever be further to the west, and the motives, whatever they are, which have prompted her advance in the direction which ultimately leads to Afghanistan, would equally point to an advance in the direction which ultimately leads to Nepaul. The southward march presents the same temptations to the Asiatic Russian that it does to the European Russian. A more genial climate and a more fertile soil are before him in each case, and, as regards China, no obstacle is interposed in the jealousy of foreign Powers. The quarrel between Russia and China can at any moment be revived, and each time that it is revived it will be appeased with some further cession of territory or some further acceptance of control.

THE SUGAR BOUNTIES AND THE BOARD OF TRADE.

THE author, whoever he may be, of the letter which Mr. EVELYN ASHLEY has addressed to the Committee for the Abolition of the Bounties on Sugar, has not cared to add persuasion to argument. Oddly enough, he has not even been at the pains to put the two letters on the subject which were sent off from the Board of Trade on the same day into decent agreement with one another. In writing to the Workmen's Committee, Mr. ASHLEY observes that a boon to the English consumer of from two to two a half millions a year is one not lightly to be rejected. In writing to the West India Committee, he describes the Board of Trade as disinterestedly anxious to reject it. They have proposed, it seems, to make inquiries of the Governments of the sugar-producing countries, whether they are willing to enter into negotiations for the removal of their bounties on the export of sugar; and they have done this in sublime disregard of the fact that "the immediate effect of the bounties is to benefit this "country at the expense of other nations." If we accept the premisses of the letter to the Workmen's Committee, it seems impossible to accept the conclusion of the letter to the West India Committee. In the former the Board of Trade rejects with horror the imputation of regarding "the imme- "diate interest of a special and limited class of producers "rather than that of the people in general." The people in general pocket from two to two and a half millions per annum in the shape of cheap sugar, and they ought not

to be mulcted of this to please a few sugar-refiners and their workmen. But though the Board of Trade will not themselves do anything to deprive the people in general of this inestimable benefit, they are perfectly ready to ask the nations who confer the benefit to withdraw it. Either the sugar bounties are a benefit to the English consumer or they are not. If they are, why should the English Government persuade other Governments to take away that benefit? It is of no avail to say that it does so for the sake of the producer. That is Protection over again, and Protection in the shape of a conference called together to get rid of the bounties which make sugar cheap is just as much Protection as when it takes the shape of a countervailing duty imposed for the same end. There is no possibility of defending both the Government reasoning and the Government action. If the reasoning is sound, the action is mistaken. If the action is beneficial, there must be a flaw in the reasoning.

We have more than once pointed out that it is the reasoning that is defective and the action that is right. The Government are well advised in doing what lies in their power to get the bounties on foreign sugar removed, because, if the sugar industry comes to an end in England, the cause that keeps down the price of sugar will cease to operate. The foreign Governments who give the bounty are not carried away by a disinterested passion for the English consumer. If it would equally benefit the foreign producer, they would be content to see the English consumer driven to give up sugar altogether, in consequence of the prohibitive prices charged for it. Consequently, when the English sugar trade had come to an end, foreign Governments would no longer have any motive for maintaining the bounties. They are as well aware as the Board of Trade can be that a Government which gives such a bounty does in effect pay "out of the "taxes levied on its own subjects generally a part of the price "which the English public would otherwise have to pay "for the bounty fed article." It commits this economical blunder for a specific purpose—the fostering of the sugar industry in its own dominions. But supposing that this industry ceased to need fostering, inasmuch as it had the undisputed command of the English market as well as of its own, the Government would at once return to economical orthodoxy. What would then be the position of the English consumer? He would have nothing to protect him against increased prices except the possible competition of foreign countries among themselves. No doubt this might have the desired effect, but it is equally conceivable that it might not. France and Holland might combine to keep up the price of the sugar they export into England, and, in the absence of any English sugar to draw prices in the opposite direction, the foreign producers would only have to stop short of the prohibitive level to make an exceedingly good thing of it. When, therefore, the Board of Trade opens negotiations with foreign Governments to induce them to take off the bounties, it is simply consulting the ultimate interest of the consumer at the expense of his immediate interest, and this in theory is a perfectly legitimate step to take.

This is not the only error which marks these letters. They go quite unnecessarily into certain disputed questions of fact which it was not in the least needful to raise. Nothing is gained by telling complainants that they are very few in number, and can have no difficulty in finding other employment in other businesses if their present occupation is taken away from them. The statement that there are only from 4,000 to 5,000 workmen employed in the sugar trade has been stoutly contested, and, even if there are no more of them, 4,000 or 5,000 men will not be easily persuaded that when they are deprived of their visible means of subsistence some other means will at once present themselves. Since the Board of Trade were so confident on this subject, it is a pity that they did not indicate the precise employment which they had in view. Such a strength of assurance could hardly be founded on anything less than actual knowledge. Men may not resent being told that there is no remedy for their grievances; they will even put up with a demonstration that the particular remedy they ask for is, for one reason or the other, out of the question. But they do very much dislike being told that they have no grievance at all, or that the remedy lies in their own hands. They feel, naturally enough, that upon these points they are the best judges. The best shoemaker cannot tell where the shoe pinches so well as the man who is wearing it. The migration of four or five thousand men from one industry to another is not accomplished without a large amount of individual suffering. None of them may be left in the sugar trade, but a good many of them may find their way to the workhouse in the course of the passage to another trade.

In the present instance the Board of Trade were not in the least called upon to go into these details. The argument against the imposition of countervailing duties is quite conclusive enough without any such addition. When the English Government negotiates for the removal of bounties on foreign sugar it knows, or may know, that the consumer will be protected against a probable, if not certain, danger by the same measure which deprives him of an immediate advantage. But, suppose it were to seek to effect the same aid by the imposition of a countervailing duty on some other article, how will it be able to measure the gain against the loss? In the one case cheap sugar in the present is weighed against dear sugar in the future. The consumer loses his two or two and a half millions now, but he is secured against a corresponding loss hereafter. If a countervailing duty were imposed on some other article than sugar, there would be no means of ascertaining whether the consumers would gain or lose by the change. How, for example, would it be possible to assess a duty on corn or silk which should cause the consumer just as much inconvenience as would be inflicted on him by the eventual dearness of sugar if no such duty is levied? It may be answered that there is no need to impose it on any other article; that, on the contrary, the end will be best answered by imposingit on foreign sugar. We feel very considerable doubt whether this last expedient would answer the purpose. It would be regarded in France and Holland as a distinct challenge to the Government which had imposed the bounty, and a Government met in this way is much more likely to pick up the glove than to leave it on the ground. In the case of France it would be open to the special objection that it would follow upon a considerable reduction of the French sugar duties, and would consequently be used by the foreign refiners as the clearest possible testimony to the uselessness of attempting to meet Free-traders half way. When the bounty was high, they would argue, England saw that France was not to be trifled with. As soon as it was lowered, England thought that France had begun to distrust her own policy, and that, under the pressure of a countervailing duty, she would altogether put an end to it. The French Chamber would almost certainly see in this state of things an argument for restoring the bounty to its former level. The conclusive objection to the prayer of the sugar trade is that any step whatever taken by England in the direction of protective duties would be fraught with infinite risk to the interests of Free-trade throughout the world. England is the only consistent advocate that the cause has, and if England were even in appearance to desert it, it would at once be accepted as the most conclusive of all conceivable intimations that she had at last become convinced of her error. The imposition by England of a duty for other than revenue purposes would be the signal for the resolute maintenance of protective tariffs where they exist, and for an immediate return to them where they have been abolished. The sugar trade might derive from this result the questionable comfort which is given by the sense of having companions in misfortune; but, with this exception, it would be in all respects as badly off as it is now.

TOM BROWN IN TENNESSEE.

If Mr. Hughes's new colony of Rugby in Tennessee succeeds, as we hope it will, and as the excellent intentions of its promoter deserve, Mr. Hughes will have conferred a great benefit on his country. What is to be done with young men who possess more muscles than brains or capital? That is the problem which Mr. Hughes's colony will solve, if the new Rugby proves a success. The world of England is wide enough still, we think, for men with brains; and capital, if judiciously invested, can take care of itself. But lads of twenty-two who cannot get appointments in the Civil Service, who are discomfited by army examinations, who justly distrust their chances at the Bar, and who have no turn for literature, are certainly in a difficult position. Every one knows plenty

of these young fellows—capital companions, good-humoured, kindly, but not very energetic, except when sport is in hand. They generally have a vague idea of "doing something" in the colonies; and from the colonies they usually return with beards, tanned faces, and a store of anecdotes which make their society sought after in smoking-rooms. We do not suppose that Mr. Hughes's Rugby is meant for settlers of this class only, and it will not suit them at all unless they mean hard work. But if the possession of land has really a great moral effect, as is believed by people who wish to turn all Irish cottiers into peasant proprietors and so convert them to civilization, then there is a chance at New Rugby for young men who seem unlikely to succeed elsewhere. Land is cheap enough. The great moral difficulty of the scheme we have already hinted at. Youths who cannot do anything at home often lack character, and want the power of working steadily at any disagreeable task. However, the task of agriculture in Tennessee, among rhododendron bushes fifteen feet high, should not be nearly so disagreeable as teaching small boys, or adding up rows of figures, or waiting for briefs, in England. It is tolerably certain that many young men of real energy, and justly fond of life out of doors, will be tempted by the prospectus of the Rugby "Board of Aid to Land Ownership."

No one can accuse Mr. Hughes of telling these young men a flattering tale. In his speech at the "opening of the town site," he remarked that other Companies published "pamphlets full of figures and statements showing the rapidity with which enormous gains will be made." As to figures and statements about the probability of gain at Rugby, he observed, "we have nothing to say." Let people who think of settling at Rugby remember this frankness, and not blame Mr. Hughes if they are disappointed. The settlers, according to a telegram in the English papers, were "very much disappointed at finding the land covered with trees." Now we do not wonder that the young men were disappointed, if they started from England with the idea that the ground was as clear as it is in Iowa and as ready for the plough. Cutting down trees is laborious work; grubbing up the stumps requires still more expenditure of force and capital. If you run a fire through the stumps you will still, we believe, have to wait some seven years before the ground is fit for the long unbroken furrows of good wheat-land. Thus intending settlers must remember distinctly that Mr. Hughes has "nothing to say" about "enormous gains." "Vacuus Viator," in the *Spectator*, does indeed speak of "visions already so bright of splendid crops"; but people who think of trying Rugby must keep "Vacuus Viator's" visions and Mr. Hughes's statements entirely apart. He "looks with distrust rather than with hope on very rapid pecuniary returns." We do not observe in the pamphlet already quoted, or in Mr. Hughes's address at the Working Men's College, any hard cold facts about results, except these:—A man has been placed in charge of some cleared land, and has grown water melons, cantalupes, tomatoes, Lima beans, cabbages, beets, squashes, and sweet potatoes. It is also stated that some one who has been in the Himalayas intends to try tea and coffee. The Store, also, has made what appear to us most rapid pecuniary returns. "The fertile bottoms," it is observed, "give good crops of maize and wheat." In what proportion are the fertile bottoms to the whole estate? As to the objects which an emigrant should set before him, we own that we are puzzled. It needs time and experience to grow fruit trees. We have a foreboding that, even in fertile bottoms which suit wheat and maize, settlers will find that the process of clearing is less rapid than they could wish. If the colony were established as a purely commercial affair, which it is not, we might doubt whether it could successfully compete with the ready-cleared wheat lands of the West. The difficulty of agriculture in the West has been the expense of transport. That difficulty is ceasing to exist. The cost of transport, we are informed, has been diminished by a half in ten years. The export of Indian corn has increased in seven years from 7,000,000 to 80,000,000 bushels, and Europe is only beginning to use Indian corn. Thus the West is a very dangerous competitor with Rugby, especially as Mr. Hughes's settlement is somewhat south, and out of the way of the great American belt of cultivated land, populous cities, and eager markets. These are commercial considerations. But Mr. Hughes's colony does not aim at mere commercial success. "Our aim and hope are to plant on these highlands a community of gentlemen and ladies; not that artificial class which goes by those grand names both in Europe and here, the joint produce of feudalism and wealth, but a society in which the humblest members who live (as we hope most, if not all, of them will to some extent) by the labour of their own hands will be of such strain and culture that they will be able to meet princes in the gate without embarrassment and without self-assertion, should any such strange persons ever present themselves before the gate-tower of Rugby in the New World." These are admirable sentiments. But it is necessary—Mr. Hughes, we are sure, will agree with us—to warn the intending settler that he must have a definite idea in his mind about what he means to do when he gets to New Rugby. Will he clear his ground himself, or pay to have it cleared for him? What sort of labourers will he find—negroes, or "mean whites," or what—in that "lovely corner of God's earth"? Is the soil likely to be very rich, seeing that it was only "in hard times" that the Boston Board contracted for the land, which, at the end of the bad times, "passed into the hands of the present London Board, who took up the enterprise as a business matter, but in conjunction with the original members of the Boston Board"? Supposing the land good, and cleared, what does the settler mean to do with it? Will he grow wheat, or Indian corn, or try tobacco, or attempt grazing, or go in for fruit trees, or live the higher life on Lima beans and squashes? These are anxious questions, but an agriculturist will have to answer them. As Rugby in Tennessee is distant only about a fortnight's journey, would it not be prudent in young men to go and see the place, and learn all about its capabilities from personal inspection, before removing their capital, and possibly their sisters, to the new community, in which, by the way, "the sale of intoxicating liquors will be strictly prohibited." It must be observed that settlers will find some one on the spot to aid their researches. The garden manager who grows the squashes will give all necessary advice. With these cautions, we recommend Rugby to sons of gentlemen with small means, ready to work with their hands in the open air; to gardeners, small farmers, or stock-raisers, with capital to pay down one-fourth of the purchase-money of their land, stock it, and carry them over the first year; and, lastly, to persons whose health requires a mild climate. These are they whom New Rugby is "likely to suit," says the prospectus.

New Rugby is nothing if not athletic. The early English settlers laid down lawn-tennis courts before building log huts. But New Rugby is not the only athletic English settlement in America. Messrs. J. B. and W. B. Close, and Mr. Constantine Benson of the Cambridge University Boat in its palmiest days, have been the founders of an English colony in Iowa. The colony is a good deal senior to New Rugby, and its prospectus has therefore much to say about the cold facts of practical results and pecuniary gains. The pamphlet lies before us, and, taken with Mr. Hughes's, is not uninstructive. As in New Rugby, the principle of co-operation is acknowledged. We hear nothing of lawn tennis, nor even of a church, both of which institutions are very prominent in the prospectus of New Rugby. It does not appear that the sale of intoxicating drinks is forbidden, but Mr. Close says, "Unless a man will keep from drink he had better stay in England, where he can get the drink he is used to, for a drunkard will no more succeed in Iowa than in England." Mr. Close says nothing about princes in the gate, but observes, "The object of our firm is to establish a colony of English people of the better class, and thus combine Western farming with some English society." The farmers in the district will board and lodge visitors at fourteen shillings a week, till the inquirer finds out whether the country will suit him. The firm examines titles (too often encumbered, it seems), and generally instructs the inexperienced farmer in "breaking" the land. Clearing is not needed. Neither trees nor stumps nor rocks break the prairie, the soil of which is most fertile. Successive crops of grasses "have accumulated organic matter on the surface soil to such an extent that the most exhausting crops, in long succession, will not materially impoverish it." This sounds better than the fertile bottoms of the uncleared forest lands in Tennessee, where, says Mr Hughes's book, "the light sandy soil requires manure to make it productive." Mr. Close takes a very serious view of the difficulties of clearing. Mr. Hughes said at the Working Men's College "It can be easily done." Mr. Close says the advantage of Iowa is that "a newcomer has not to spend the best part of his life in cutting down trees, uprooting stumps, and clearing away heavy logs from his farm, as he would have to do in a timber country." The most certain of all crops is maize; wheat has occasionally suffered from blight. Barley and oats do well. Flax suits the ground when first broken, and leaves it cleaner for next year. Potatoes flourish, and naturally the "boundless prairie" is fitted for cattle raising. Chicago is the market, a sufficiently large and eager emporium. Labour is said to be cheap, and labourers are not advised to emigrate. There is scarcely any big game; but, on the other hand, "bowie-knives are not wanted." As to capital, a man unaccustomed to roughing it should not try Iowa with less than 1,000*l*. "It takes time for him to learn to work as a labourer." As to pecuniary results, Mr. Hughes's plan is the best for us to follow. We say nothing about them; but we may suggest to intending emigrants that fertile lands ready cleared in the great wheat and maize country offer at least as promising a home to the English colony already settled, as visitors can hope to find in the uncleared "close" of New Rugby.

THE REIGN OF LAW IN IRELAND.

A FORMIDABLE triumvir has joined the duumvirate which, composed of the dead Dr. Johnson and the living Mr. Carlyle, has so long been exhorting the English people to clear their minds of cant. This new preacher is Mr. Jacob Bright, M.P., and the particular variety of cant to which Mr. Jacob Bright has devoted his destructive energies has something to do with Ireland. Of all the cants which are canted in this canting world, that which is most tormenting to Mr. Jacob Bright is the cant of "teaching the Irish to respect the sacredness of the law." He is, he informs us, tired of these cant phrases, and he proceeds to tell the world, with an ingenuous frankness which his brother would hardly have shown, why he is tired of it. The Legislature some years ago robbed him, Mr. Jacob Bright, and his brother manufacturers of their right to work their factories (and their factory hands) twelve hours a day, and cut them down to nine hours and a half. What can be fairer, therefore, than that the Irish landlords should be robbed likewise? Mr. Jacob Bright is quite tired of the cant which says that it is not fair, and indeed of the cant

which talks about the sacredness of the law at all. It is to be feared that among the many gifts of the member for Manchester the perception of analogies is not the most remarkable. But, as it happens, the case does supply an analogy which is strikingly appropriate. Suppose Mr. Jacob Bright's workmen were to come and say to him, "Sir, your present system of pocketing the profit after giving us fixed wages is in the last degree unfair. We will, if you please, relieve you of the trouble of the division. We will take enough of your profits to enable us to live comfortably, to dress well, to pay our tradesmen and the publican, to put something by for a rainy day, and, as all Lancashire lads and lasses are fond of music, to go over to Manchester now and then, and to hear Mr. Hallé's very improving concerts. When these things are comfortably arranged for, leaving us a margin in case of accidents, we shall be very happy to hand you over the balance, if any." This is exactly the proposition which the extreme Land Leaguers make to the landlords, and to which the canting persons of whom Mr. Jacob Bright is so tired object as infringing the sacredness of law. What is more, Mr. Bright must know perfectly well that there are plenty of operatives in Lancashire who are very firmly convinced already that this is the right thing to be done with him and his like. So perhaps it is a little imprudent, in one sense, of him to announce himself as tired of the cant about teaching the Irish to respect the law, just as it is very imprudent in another sense to revive the memory of the attitude of his political friends in the matter of the Factory Acts.

Mr. Jacob Bright, indeed, is not a person of great importance. He is only Ursa Minor, and not Ursa Major, among the *lucida sidera* of the Radical party. But it is curious to observe that the action of the Government is encouraging a good many other members of that party to talk in the same way. The serious political student might say that nothing is more indicative of the degradation in the morale of the average member of the present Parliament than the way in which many of the carpet-baggers who were elected last April on the Government side have expressed themselves on this Irish question. But the phenomenon, as well as other phenomena, makes us feel considerable respect for Mr. Gladstone's political wisdom. Indeed we can hardly remember feeling so much respect at any previous time for that sometimes vanishing quantity. The determination not to call Parliament together has already justified itself in several ways, and only persons whose heretical pravity is proof against the clearest demonstration can now doubt it. In the first place, the delay is strictly fair. The Irish are engaged in endeavouring to bring the public opinion of England round by the means which Mr. Gladstone himself indicated to them a year ago as those best calculated to attain the end. Could anything be more iniquitous than, after giving the prescription, to refuse time for the cure? All great inventions, from penny postage to Boycotting, demand a certain time to mature them, and to interfere with the process is in the highest degree unjust. Besides, the longer the present state of things in Ireland continues the stronger becomes the position of the advocates of confiscation. More landlords can be shot and starved and made bankrupt and driven out of the country in a month than in a week; that is evident. The more intolerable the position becomes, the more waverers will every day be induced to support the Government Bill, whatever it may be, in company with which protection is promised them. More Radical members will be encouraged by the parrot cry of their party organs to declare that the cant of enforcing the law is quite disgusting. More districts will be reduced to that admirable state of outward peace which Mr. Parnell, with great truth, pronounces to be the result of perfect Land League organization, and in which no outrages are committed for the simple reason that everybody is in such mortal terror that no occasion or excuse for outrage is ventured upon. A clearer demonstration than this cannot possibly be required, and were it not for the dogged malignity which, as we know, always misrepresents Mr. Gladstone's conduct, it would have forced itself long ago upon the minds of all reasoning people.

Still this consummation is not yet arrived at either in England or in Ireland, and there are still persons whose conduct and utterances deserve the disgusted indignation of Mr. Jacob Bright. Judges (not always, it must be confessed, with discretion) continue to express the absurd idea that the law ought to be enforced; infatuated policemen, process-servers, and other instruments of cant persist in now and then doing their (cantingly so-called) duty, and receive the just reward of their deeds at the hands of a majestic people. The Reign of Law in Ireland at the moment is a singular one, and perhaps the Duke of Argyll (who, as an unprotesting member of the Government which maintains it, must be held responsible for its continuance) will oblige us with a new edition, altered in subject and corrected to date, of his admirable scientific treatise. It seems well now and then, during the ripening of Mr. Gladstone's plan, to invite those persons who have not wholly cleared their minds of cant to consider what is actually going on across St. George's Channel. This week there is no need to collect materials, for we have them already collected for us by Mr. Justice Fitzgerald. That learned judge opened the Winter Assizes for the province of Munster on Tuesday last, and charged the Grand Jury as usual. Mr. Justice Fitzgerald's charge is a very interesting document, and may be expressly commended to the attention of those optimists who, forgetful of certain statistics in connexion with the Disturbance Bill, have been making themselves happy for a week or two over the Government statement that crime has not increased in Ireland. Cookery is an admirable thing, and "civilized man cannot live without cooks," but we venture to think that after Mr. Justice Fitzgerald's charge the Government would be well advised to exclude statistics from the list of materials on which they exercise the culinary art. The Judge began by an observation which was partly cheerful and partly gloomy. The Grand Jury, he said, must not think from the gravity of his tone that there was a technically "heavy" calendar before them. It was quite the contrary—in nine-tenths of the cases of reported criminality there was nobody made amenable. This is highly satisfactory for the Grand Jury of the Munster Assizes, who will not be long detained from the happy homes where they may pursue their ordinary vocations and be shot at and Boycotted. But, according to the method of arithmetic which Mr. Gladstone and Mr. Forster prefer, it is quite clear that the thermometer of Irish crime runs up to a startling number of degrees in virtue of this observation. For every offence that comes within the regular and complete cognizance of the law there are ten which do not so come, for the simple reason that nobody is made amenable for them. Perhaps we may add, though it was no part of Mr. Justice Fitzgerald's duty to do so, that for every ten offences the commission of which is known, a hundred at least, in the shape of threats enforcing compliance with illegal demands, may safely be added to the list. In certain districts in the province of Munster, says Mr. Justice Fitzgerald, everybody of a certain class has a rifle and a revolver —usual ornaments of the person, of course, under the Reign of Law. Here is a list, for the county of Clare only, of extraordinary offences—offences, that is to say, which in a country of canting law-abiders like England do not occur at all, or only once in a moonshine:—Forty-three letters threatening murder or violence, three cases of firing into dwelling-houses by armed and disguised parties, two of cattle-maiming, eight of arson, three of forcible possession. Now that Mr. Knatchbull-Hugessen is a peer, and half in Opposition, nursery tales and nursery rhymes are probably beneath the attention of any member of the Government; but we really should like to see a version of "The Mulberry Bush," descriptive of the way they keep the law—the ordinary law, which reigns so securely that the very contingency of its having to be supplemented cannot enter Mr. Gladstone's head—in county Clare. "This is the way we fire our guns; this is the way we blacken our mugs" (the necessities of metre must excuse slang), and so forth, would make, with the appropriate business, a most spirited game; and the finish, "And this is the way we keep the law," would be most effective. But we must go back to Mr. Justice Fitzgerald, though we cannot hope to do justice to all the articles of the singular programme he had to set before the Grand Jury at Cork. Limerick beats Clare hollow, and Kerry can match the two put together. Mr. Justice Fitzgerald referred specially to a case of ear-slitting. If anybody wishes for minute, but slightly sickening, details as to this particular amusement of the amiable persons whom a certain party among us desire to estate and endow at the expense of their landlords, we have the pleasure to refer him to the *Daily News* of Tuesday, where will be found a full and authentic account of the process as carried out in the case of a man named Griffin only last week. In this case our Radical friends can hardly say that they like not the security; for Bardolph is one of themselves.

Ear-slitting, arson, cattle-maiming, murder and threats to murder, interdiction of fire and water—by the way the last person Boycotted is a lady, Miss Gardner, and only her revolver and the police protected her from the chivalrous folk of the West on Tuesday last at Ballina—these are the things which people tire Mr. Jacob Bright so terribly by objecting to. To say that the Irish must be taught by the sharpest and speediest means not to earslit, not to maim, not to threaten, not to murder, not to Boycott —this is cant. No law is sacred, says Mr. Jacob Bright with much eloquence but some obscurity, which destroys a people. The destroyed people seem to be curiously capable of active destruction in their turn. But, as we have said, reflections of this kind are cant. The only Reign of Law which is agreeable to Mr. Jacob Bright is, it would seem, the reign of lynch law, arranged in a truly Irish fashion, so that the wrong-doers are the judges and the sufferer is the person punished. The state of affairs is a little odd when it is compared with the words of Lord Selborne (who is also still a member of the Government) only a month ago. But that was after dinner, and after dinner a great deal of allowance must be made, even for noble and learned lords. The heart of man is tender then, and generous sentiments flow freely from his lips. Cooler reflection shows that such sentiments are only cant, and that the actual Reign of Law in Ireland is perfect.

THE *TIMES* ON ARMY REFORM.

THE *Times* has lately been busily engaged in preparing men's minds for coming military reforms of a thorough and comprehensive nature. Once more we are called upon to listen to the old familiar words set to a different tune. Once more we are told that a few finishing touches are necessary to complete the reorganization of our military system, or, to quote the words of our contemporary, "Mr. Childers will unfold a plan containing many important reforms, and giving general cohesion and shape to the organization begun some ten years ago." The first announcement which follows is of a somewhat startling nature. Public opinion in general,

and military opinion in particular, has been much exercised of late with regard to the proposed abolition of our present regimental titles and numbers, and the substitution of territorial designations applied to the two linked battalions belonging to each brigade depôt. The *Times*, however, goes a step further, and wishes for groups of four battalions instead of two. "Regarding the territorial regiments in which the present Line battalions are to become merged, there is, we believe, a prevalent opinion in favour of an establishment of four battalions instead of two in each case." Our experience in this respect is certainly at variance with that of the *Times*, for, while we have never heard the four-battalion system advocated, we have seen a considerable amount of opposition offered even to the two-battalion system. According to the *Times*, however, "Two of our present corps—the 60th and the Rifle Brigade—consist of four battalions each; and the experience of the working of the Localization scheme for the last few years would seem to show an adaptability to all contingencies more complete in their case than in that of the double-battalion system upon which the twenty-five senior regiments of the Line are constituted." Why only the twenty-five senior regiments? Are not all our regiments now linked in pairs which are, to all intents and purposes, double battalions? The advantages to be derived from this proposed quadruple alliance of battalions strike us as somewhat doubtful. "There would be more local consolidation, a greater interchangeability of officers and men, a larger depôt to draw upon, and generally an increased capacity for meeting sudden and extraordinary pressure." "More local consolidation," we presume, means a few large recruiting centres in preference to a greater number of smaller ones dispersed over the country. As the recruiting sergeant generally has to seek his recruits instead of their coming to seek him, we suspect that the latter plan is the better of the two. With regard to "a greater interchangeability of officers and men," we can only say that we have hitherto been under the impression that the more officers were acquainted with their men and the men with their officers the better. Nor can we see the force of the argument that there would be "a larger depôt to draw upon." We fail altogether to perceive that a depôt of given size which has to supply four battalions is relatively any larger than one half that size which has to supply two battalions. There is some force in the statement that there would be an increased capacity for meeting sudden or extraordinary pressure; for it is undoubtedly true that, in the event of an urgent demand for troops, the battalions to be despatched to the scene of operations would each have their own depôts as well as those of the three other battalions to draw from. But meanwhile the said three battalions must go without recruits; so, after all, it is merely robbing Peter to pay Paul. It is certainly, however, one degree better than volunteering from other corps, and that is about all that can be said in favour of the four-battalion scheme. We are next informed that "care will be taken that the corps standing highest on the roster for foreign service are kept in readiness"; and this is undoubtedly a step in the right direction. We are aware at this moment of a regiment which is on the eve of foreign service, and which cannot muster five hundred bayonets. But the succeeding sentence somewhat dashes our newly raised hopes:—"In fact, a battalion at home while, as at present, sustaining its link abroad for the first half of its stay in the United Kingdom, will, during the other half, be *solely* engaged" (the italics are ours) "in working up its own strength with a view to embarkation, in its turn, in a thoroughly efficient state." What then is to become of its linked battalion abroad during the last five years of its foreign service, possibly in an unhealthy climate, or on active service? If we could be perfectly certain that it would be allowed to spend the said five years in peace and quietness, well and good; but such an hypothesis is out of the question.

It is the old story once more, which, put into plain English, is simply this. We want a certain number of recruits annually; if we can get them, the present system, or for that matter any other system, will do well enough; if we cannot get them, no amount of manipulation, reorganization, reform, or by whatever other name it may be called, will enable one man to do the work of two, or to be in two places at once. It is wonderful to see how the practical and business-like Briton will allow himself to be amused and diverted with subordinate and subsidiary questions like these, while the real point at issue—how to obtain a regular and sufficient supply of recruits—is conveniently ignored. We are next informed that "discriminating, and we hope effective, steps will be taken to obtain a due supply of good non-commissioned officers. The sinecure colonelcies will disappear. The present enormous list of generals, many of whom are generals only by age, will be replaced by a number proportioned to our requirements, all of whom will be generals by proved fitness for the duties of the position." We have nothing to say against any of these measures, which are alike salutary and economical. They are, however, matters of detail, and we pass them over to proceed to another proposed reform of a much more important nature, and one to which the greater portion of the article before us is devoted—namely, promotion by pure selection for the ranks of major and lieutenant-colonel. This drastic change, for that is what it really is, is strongly advocated by the *Times*, and supported by a number of arguments of a decidedly plausible and specious nature. We are told a great deal that we knew before about the advisableness of having the fittest man to command, and the importance and responsibility of the duties attaching to the command of a regiment. We also hear certain things that we did not know before—for instance, that "all (officers) are equally eligible for promotion, and all equally liable to supersession, without regard to merit or demerit. Mere seniority settles the question." We unhesitatingly challenge this last statement as being utterly opposed to fact. Every year scores of officers disappear from the Army List as they approach the upper regimental grades, not of their own free will, but because they have been privately given to understand that, in consequence of unfavourable reports, they cannot be permitted to hold the command of a regiment. All this is done so quietly that it is not noticed, and this fact alone is sufficient to make the present system unpalatable to the Radical mind, which prefers ostentatious publicity.

According to the *Times*, "Some ten years ago we paid largely for the abolition of a system of promotion that was based upon seniority tempered by money; but we certainly did not make this sacrifice merely in order that we might substitute seniority pure and simple. And yet this is about the only result we have attained." We entirely deny this, and assert that the present system in our army is seniority tempered by rejection, and tempered too to a much greater extent than is generally known, or even supposed, for the reasons above given. We have no wish to be misunderstood in this matter, and we are by no means among those who maintain that our present system is perfect. That the Commander-in-Chief occasionally errs on the side of leniency and from excess of consideration for the private feelings of officers, may be true; but, before we join in the cry for pure selection, we shall need some more convincing arguments than the *Times* has yet adduced. These arguments are directed to prove—first, that the best man ought to succeed to the command of a regiment, which we do not deny; and, secondly, that it is easy to ascertain who is the best man, which we strongly doubt. So long as men hold different ideas and different opinions, they will report in various terms of the same person, and any officer may be warmly commended by one authority and disparaged by another. In a recent speech at Galashiels Mr. Trevelyan accused the Duke of Cambridge of "having given evidence before a Royal Commission which was one long denunciation of promotion by selection." It is within the bounds of possibility that the Duke of Cambridge, with his experience of a quarter of a century in command of the army, may be better qualified to give an opinion on this point than the member for the Border Burghs; but this is, of course, a matter of opinion. The objections of the Commander-in-Chief to the proposed system are based upon the widely conflicting nature of the confidential reports he receives upon various officers, and we only wish he could be put into the witness-box to give evidence upon this point. Finally, the *Times* gives us this curious piece of advice as to how to obtain true information:—"If the military authorities are unwilling to undertake altogether the invidious task, they might institute such a system as prevails in the French army, where, by a close inspection by different generals, and a comparison of reports independently made, a fair estimate of the comparative merits of officers is arrived at by the War Minister." We cannot too strongly denounce this servile imitation of foreign models, regardless alike of their intrinsic value or their applicability to our own system. Let the tree be judged by its fruit. Has not the discipline of the French troops been for years a byword in Europe? Is it not notorious that it collapses under the smallest reverse? Given a consummate general to command, an inferior one to encounter, and all goes well; reverse, or even alter, these conditions, and immediately the cry of "treason" is heard, and the regiments fall to pieces. Could any one who had the interest of our army at heart recommend the adoption of such a system after reading General Trochu's pamphlet on the campaign of 1859? Is it not true that French officers, themselves of high rank, advised us after the Crimean War to reform our general system, but on no account to touch our regimental system, for it was perfect?

We are quite aware that would-be army reformers make great use of the argument that there has never been any military reform attempted which was not violently opposed by military men. There is force in this; for it must be admitted that military men, as a rule, are highly conservative, and it is no doubt fortunate that they have not had things all their own way. But what has been the result of all our reforming? Has it always been good? It seems to us that so long as we confine ourselves to matters of detail—such as education, hygiene, equipment, barrack accommodation, &c.—we succeed, but whenever we attempt any reform on a grand scale, we fail miserably. We abolished purchase, and removed the grievances of a few to supply grievances to the many; also for the purpose of buying back our army in order to manage it ourselves, which, as we may perhaps show on another occasion, we have failed to do. We spend seven millions in barracks for the depots of our newly-formed linked battalions, and find that we might just as well have thrown the money into the sea. We institute short service and a reserve, to find that we have a splendid second line which we cannot use, while we have ruined our first line, which is in daily requisition for colonial wars. Regarding short service, we would also call attention to Sir F. Roberts's speech at Woolwich, in which he stated that, when offered his selection of regiments for the march to Candahar, he chose those which contained most old soldiers, and the result was that at the completion of the march he had only three per cent. of the whole force sick. We also hear that of one battalion in General Phayre's column, which was chiefly composed of young soldiers, nearly fifty per cent. were on the sick list. With such experiences before us, it must be admitted that there is some justification for those who begin to distrust drastic changes in our military system,

and though we would never oppose a reform merely because it involved change, we cannot see sufficient grounds at present for instituting promotion by pure selection. Let rejection be more largely practised, if a change is needful, but we cannot see that it would be advisable to go further at present.

LA DONNA NON È MOBILE.

ON Wednesday last the Manchester National Society for Promoting Women's Suffrage held its annual meeting in the classical locality of the Free-trade Hall. Many things combined to exalt the spirits of the champions. A Parliament of crotcheteers is offering premiums to anybody who will cry loudest the old cry of *Fatras à la douzaine!* The Isle of Man has passed, by a tremendous majority of its House of Keys—there were sixteen enlightened Manxmen on one side of the House and only three on the other—a Bill admitting women to the suffrage. A crowded meeting has been held in Bristol in favour of the movement. A census has been taken in Newnham Hall, the result of which went to show that some ninety-four per cent. of the young ladies there educated conceal advanced Liberal opinions under their talented foreheads. Mr. Gladstone, it is true, has been a persistent opponent of the movement; but then Mr. Gladstone, as Miss Becker pointed out amidst the ringing cheers of the Free-Trade Hall, has been notorious all through his career for coming round to the side of which he has been the persistent opponent. There always is a devil's advocate on these occasions, and the function was discharged on this occasion by Mr. Alderman Bennett. This father of the city of Manchester is a sound women's suffrage man; but he took a nasty manly pleasure, it would seem, in damping the hopes of his enthusiastic companions. Not only did he make the remark about Mr. Gladstone which was, as we have seen, successfully countered by Miss Lydia Becker, but he made unpleasant remarks about the House of Bright. The voice of Jacob, he pointed out, was in favour of women's suffrage, but the hands of John were against it. And it would appear that Mr. Alderman Bennett has more confidence in the hands of John than in the voice of Jacob. The Alderman went further, and indulged in some horribly common-sense remarks about the Parliament from which Miss Lydia Becker and her friends hope so much. "They talked about a Reform Bill," he said, but he requested them "not to believe it." Members, said this cold-blooded Alderman, had had much too much money to pay to sign their own death-warrant so soon. They would want, he thought, to "try their saddles" before they committed political suicide. This was altogether like a man; but, even independently of Miss Becker's spirited rally, the majority of the persons present were in far too good humour to be dashed by the skeleton obtruded so needlessly by Mr. Alderman Bennett. Had they not the House of Keys on their side, and is not the House of Keys probably the most ancient representative body in Her Majesty's dominions? The lock of the voting-booth is already picked by those keys, and the women-voters are only waiting for a few formal preliminaries to rush in and possess it. Besides, a greater than Mr. Alderman Bennett had preceded that depressing magistrate, and had cheered them on to the goal. Mr. Courtney had spoken as, for the matter of that, Mr. Courtney has spoken on the subject many times before. His function, unless we mistake, has usually been to talk out the annual proposals on the subject, so that ignominious defeat should not discourage his clientesses. The dulcet tones of Mr. Courtney on a Wednesday afternoon have before now anticipated the harsh notes of Ben, and have announced six o'clock, and a drawn battle. But on this occasion the member for Liskeard was on his mettle. The Mayor of Manchester had resorted to the arithmetical argument, and had laboured to prove that the more voters the better. Portarlington had about a three-hundredth part of the voters of Lambeth, with one-half the representation. Could anything be more unfair? The bearing of the remark on the question is, to the male mind, vague, being confined apparently to the contention that anything which adds to the constituency is a gain. Women voters would add to the constituency; therefore, &c. But Mr. Courtney, with a frankness which did him honour, and which must have covered the Mayor of Manchester with shame, pointed out that he individually was the representative of a small constituency. It became him, therefore, to make a bold stroke for the purpose of showing his fitness to be a member of Parliament, and a bold stroke he made. It might have been thought that it was impossible for anybody to say anything new on this subject. But "Todgers's can do it when it chooses." Mr. Courtney—let us admit it with a frankness equal to his own—achieved this miraculous feat.

The member for Liskeard, it seems, is troubled, as indeed many other persons who study politics are troubled, by the thought that an increasing instability is being manifested by the constituencies. "Every man," he thinks, "who takes an adequate view of public affairs must feel some anxiety, must experience occasionally some little apprehension, when he sees the too great facility of change of public opinion. When they saw that the verdict of to-day was reversed by the verdict of to-morrow, they could have no faith in the abiding nature of that second verdict, they could not but feel that something was wanted to give greater stability to the public mind." Mr. Courtney has discovered this something. Add to the constituencies a class whose stability is proverbial, whose insensibility to change is one of the axioms of the human race, and the thing is done. The announcement seems to have taken the breath of the Free-trade Hall away, and well it might. Probably the audience thought at first that Mr. Courtney was poking his fun at them, that fun for which he is so deservedly famous. Time was when womankind cherished its right of changing its mind as the dearest jewel of its crown, and now Mr. Courtney tells it to abandon at once the foolish fancy. Woman is not a changeable creature; the only reason why she has been so represented is because the lions have never hitherto been the painters. As for *varium et mutabile semper*, it is a vile calumny. Woman is a creature of rigid consistency, founding all her likes, all her beliefs, all her wishes, on a clear and logical basis, and pursuing her conclusions—there is no doubt about this at any rate—to the very end with unflinching effort. Mr. Courtney *locutus est*, and there is no more to be said in the matter. We must instantly set to work to re-write the shameful texts in which the characteristics of the sex are maligned and misrepresented. The difficulties are indeed great. Will any Girtoness undertake to adjust to a reasonable alcaic scansion the words *justam et tenacem propositi mulierem?* We cannot undertake this, but after all it does not matter. If the alcaics cannot be got into shape, so much the worse for the alcaics. Alcæus was only a man, and did he not receive an admirable castigation from Sappho? Besides, there is precedent for the neglect of metre. When the Jesuits found lines of the classics which justly revolted their notions of morality, they altered them with a noble indifference to results. "Galateam" did duty for "Alexim," and why not "mulierem" for "virum"? Surely a member of the Manchester Society for the Promotion of Women's Suffrage is not to be deprived of privileges accorded to the followers of Loyola? The matter may be considered settled, and an enterprising publisher cannot too soon get ready an edition of the literature of the world, altered *in usum fidelium*. Besides, did not Mr. Cobden make a famous statement about these very classics? What do they matter? It is a case of authority against truth, and, in the end, the great (feminine) truth will undoubtedly prevail. The really inconsistent being is man; indeed his wife frequently tells him so, and she must know. When we have feminine voters there will be no more see-sawing of the constituencies. They will all vote straight, and will abide in that straightness according to the dictates of pure reason. No variableness will there be in them, neither shadow of turning, and the member who is once happy enough to receive their suffrages will retain them with a security known at present only to the fortunate holders of University seats.

But Mr. Courtney had not done with his audience even when he had delivered unto them this remarkable paradox. The injurious remarks of the Mayor of Manchester had spurred him up to yet another effort. Indeed the experienced frequenter of the circus knows that when the daring professional has taken four hoops, he or she is almost certain to take five; for art is long, and the ambition of the true artist is insatiable. Before the astonished audience in the Free-Trade Hall had recovered their breath and made up their minds whether they were being flattered or insulted, the encouraging *houp-la* was once more heard, and Paillasse had executed a still more daring feat. "Were the reasoning powers of women intended by the Creator to remain inactive?" asked Mr. Courtney triumphantly; and, as Mr. Justice Manle was not there to make the appropriate answer, he obtained his success unopposed. "Without the assistance of the reasoning powers of women," Mr. Courtney thinks, "men fight the battle of life with one hand tied behind them." Whether Miss Becker felt herself complimented at the notion of her reasoning powers being as yet undeveloped, and requiring the franchise to develop them, we do not know. But Miss Becker is an exception. She is, as a speaker at the Bristol meeting told her audience (with perhaps some forgetfulness of a certain anti-climax about a "great god of war" and a "lieutenant-colonel to the Earl of Mar"), "the great leader of the cause and a four-times-elected member of the School Board of Manchester." To her, therefore, Mr. Courtney's perilous argument cannot be supposed to apply. But in other directions his hint is fully worth working out. It is clear that, in order to carry out the intentions of the Creator in reference to the reasoning powers of women, we must have means; we must keep our precious powder dry. Somebody (Mr. Courtney himself would do it admirably), should write an "Artis logicæ rudimenta in usum feminarum." We must apologize for giving an academic tone to this article, but Mr. Courtney himself is nothing if not academic, and our hand is necessarily subdued to what it works in. The treatise, which would be at once welcomed at Girton and Newnham, would be a most instructive comparative study with Aldrich, or, as we believe the newer curriculum has it, with Professors Jevons and Fowler. As a hint to Mr. Courtney, though it is absurd to suppose that the member for Liskeard wants hints from us, we suggest, as a specimen attempt more particularly, the doctrine of conversion. Hitherto no male being has ever been able to impress on the feminine mind the fact that, if all A is B, all B is not necessarily A. To give an instance, the undoubted fact that all persons who ill-treat their wives are husbands is but too apt to be construed by the reasoning faculties with which the Creator has endowed women as equivalent to the statement that all husbands are persons who ill-treat their wives. Now this of itself opens up a wide prospect for the formal logician of the future. Sir William Hamilton is dead and Professor Mansel is dead. *Morts sont Ogier et Charlemagne;*

But we trust that there are good logical men—and of course women—left in this realm. Will nobody set about the new Prolegomena Logica? It is clearly a work of urgency, and should, if possible, precede the arguing out of the thesis that women are certain to add a character of stability to the constituencies and to things in general when they obtain the franchise. For it cannot be doubted that the new principles of argument will render the proving of this point far easier than it would be at present under the foolish rules derived from the study of Aristotle—Aristotle, who, as the famous *Lai* shows, had himself to acknowledge the supremacy of the most charming, most reasonable, and most consistent of sexes. The prentice hand of logic was tried on man—"And then it formed the lasses, O!" But this is ribaldry, and we beg Mr. Courtney's and Miss Becker's pardon for quoting it.

TORPEDOES.

THE art of destroying life makes steady, and sometimes rapid, progress in our days. It is true that in this, as in all other arts, ideal perfection seems unattainable, and that unforeseen difficulties occur to check and harass enthusiastic inventors; but, on the whole, there has been a great advance within a comparatively short space, and no reason can be found for supposing that this advance will not continue. Wonderful, indeed, has been the energy shown in developing what we will venture to call the destructive side of civilization. All methods of taking life have been largely improved, and in nothing perhaps has so much skill and inventiveness been shown by those who labour to produce many deaths as in the construction of torpedoes. Small-arms are made more certain, but ingenious tactics are devised to diminish their deadly effect. Artillerists largely increase the power of great guns, but naval architects meet them by increasing the strength of the plates which cover their ships' sides. With respect to torpedoes, however, the progress seems to be all one way. They have apparently been made so formidable that all means of defence are overcome; at least, if any are known, there is certainly the most praiseworthy silence respecting them.

An interesting sketch of the history of these wonderful engines of destruction, and of some of the methods of using them, is given in the current number of the *Nautical Magazine*. What will most strike readers of that article is the wonderfully short space of time within which torpedoes and torpedo boats have been brought to their present state of destructive excellence. The idea of destroying vessels by submerged cans of powder did indeed occur to an inventive mind long ago, as in 1805 Robert Fenton blew up a brig in this way off Walmer Castle; and during the Russian war an attempt was made to use torpedoes against our fleet in the Baltic; but nothing resulted from the experiment, and the attempt was a futile one. We owe these engines, as we owe so many things good and bad, to the Americans; for it was not until the American war that torpedoes were, to borrow a phrase from Mr. Gladstone, brought within the range of practical warfare. The writer in the *Nautical Magazine* briefly describes the destruction of the sloop *Housatonic* and the ram *Albemarle*, which first showed what torpedoes could accomplish. In both these cases, however, the attacking boats were lost, and the first serious efforts to use torpedoes were crude, as first efforts must be even in America. Had hostilities lasted longer more science and skill would have come into play. As the writer pathetically observes:—"Towards the close of the war, arrangements were made on both sides which doubtless would have resulted in a much more extensive use of boats built for the purpose, and with better arrangements for fighting the torpedoes."

Unfortunately peace came and prevented the very interesting experiments which were contemplated from taking place. During the interval between the American Civil War and the Russian contest with Turkey, torpedoes were much improved by painstaking men, and torpedo boats, properly so called, were invented and constructed with marvellous skill. Nevertheless, when that war came, these engines scarcely did as much harm as had been expected; but it seems clear that this was in no way the fault of the patient thinkers who had devoted themselves to improving the means of drowning their fellow-creatures. The implements provided were good enough, but the workmen did not know how to use them. There was, indeed, a happy exception, as in one case great success was achieved. As must still be well remembered, a large Turkish monitor was blown up on a branch of the Danube by torpedoes. One was exploded under her stern, and another subsequently amidships, and the monitor sank forthwith. In this affair, however, though marvellous courage was displayed by the assailants, they were greatly aided by the almost incredible folly and carelessness of the Turks, who kept so bad a watch that they did not observe the torpedo boats until they were close at hand. It can hardly be supposed that the officers and seamen of any other navy would be so purblind, and the destruction of the Turkish vessel cannot, therefore, be considered to give an example of the manner in which an assailant may hope to use torpedoes in naval warfare. On the other hand, the unsuccessful attempts to use torpedoes made by the Russians during the war cannot be said to prove anything against the fitness of these engines for causing destruction. The writer in the *Nautical Magazine* says:—"Several unsuccessful attacks were on other occasions made, both by means of torpedoes attached to spars and by fish torpedoes. They appear not to have been very skilfully managed, and the circumstances connected with them do not point to any conclusions adverse to the general efficiency of the weapon." We may add that, in the opinion of those who ought to be best able to judge, the unsuccessful attacks in no way proved that torpedoes are likely to be other than formidable. As is well known, the Russian Government has caused a large number of torpedo-boats to be constructed, and it is clear that great faith is felt, by those who are best informed, in the efficacy of the last engine of destruction which the wit of man has devised. In all probability their faith is well justified, for, if the difficulties of managing the terrible fish torpedo have been overcome, and if it is now possible to launch it from a considerable distance against a vessel with a fair likelihood of hitting her, it is hard to see what chance war-ships will have in an attack on a harbour or in an engagement in smooth water. This and the other two kinds of torpedoes which are likely to be formidable in aggressive operations are briefly but clearly described in the *Nautical Magazine*. Besides the elaborate engine named above, there are spar and towing torpedoes. The first is so well known that it is scarcely necessary to give any account of it. The torpedo is placed at the end of a spar projecting from the bows of a boat, and is rammed against the ship's side, which it shatters by its explosion. Although attacks with this weapon have, as has been shown, been successful, it is doubtful whether it is likely to be of much use in future warfare. The danger to those who man the boat which carries it is beyond all other dangers even in a naval engagement, and the most perfect coolness and steadiness are necessary in directing the attack. Dare-devils are generally to be found, but men who unite utter recklessness of life with perfectly calm judgment are, in all armies and navies, sufficiently rare. It is further to be observed, that the Nordenfelt gun will probably be found extremely efficacious against spar torpedo-boats, and probably achievements with these weapons will not be numerous in any future war. Of the towing torpedo not much appears to be known at present, and from what is known it seems doubtful whether it is likely to be formidable except when handled with very great skill. It is to the fish torpedo that scientific sailors look for the defence of harbours and the destruction of fleets. The best kind of fish torpedo is the Whitehead, as need hardly be said, and, though this has often been described, we will give the account of it which appears in the *Nautical Magazine*, as it sums up very tersely but very clearly what is known respecting the terrible engine of destruction. It is as follows:—

> The Whitehead torpedo is cigar-shaped, its shell being made of steel. It is divided into three compartments; the foremost one contains the charge of gun-cotton, which is put in just before it is used. The bulk of the cotton is wet, but is fired by means of a portion of dry gun-cotton, which is ignited by a detonating fuse when the torpedo strikes the enemy. The tail part is filled with compressed air, which furnishes the motive force, and the middle compartment contains the engine, by means of which the motive power is supplied to the two screw propellers which work in opposite directions, and thus secure the "fish" travelling in a direct line. The pressure of the air is as much as 1,000 lbs. per square inch, and the quantity carried in the full-sized torpedoes will propel them 1,000 yards at a speed equal to 16 knots per hour. . . . Good practice has been made with the Whitehead, up to and in some cases beyond a range of 600 yards. Its reliable range, however, may be put down as about 450 yards. The average weight of the Whitehead torpedo is about 520 lbs., and each one costs 350*l*.

What a tremendous weapon this is need not be pointed out. But the most powerful weapon may be of little avail unless there are fit means for using it, and with regard to torpedoes this fact seems to have been thoroughly appreciated, as the highest skill has been devoted to the design and construction of the vessels which are to carry them. Nine years ago the well-known launch-builders, Messrs. Thornycroft of Chiswick, showed what speed could be attained by small vessels, and in 1873, according to the *Nautical Magazine*, they constructed the first high-speed torpedo-launch. Her pace was fourteen knots, which seemed marvellous at the time, but, as we need hardly say, has been far surpassed since. After building this boat, Messrs. Thornycroft constructed others for the Swedish, Danish, Austrian, and French Governments, constructing for the last-named two admirable vessels which had a speed of over eighteen knots an hour, and were good enough as sea boats to steam from Dover to Cherbourg. In 1877, four years after the first torpedo launch had been set afloat, our Government awoke to the fact that these marvellous little craft were likely to be of some service in warfare, and the *Lightning* was built for the Admiralty. By a misprint apparently, she is described in the *Nautical Magazine* as having a speed of ten knots. Unless we are mistaken, she can steam at nearly twice this pace; but her speed has been surpassed by vessels more recently built. Altogether twelve torpedo launches have been constructed by Messrs. Thornycroft for the Admiralty, and it is stated that "in the latest a speed of twenty-two knots per hour has been obtained, with about 450 indicated horse-power, on a displacement of thirty tons." How extraordinary such a speed is need scarcely be said. Nothing in the annals of modern naval architecture is more remarkable than the rapid development of this type of vessel. If a few years ago any shipbuilder had talked of constructing a launch of thirty tons which would steam at the rate of more than twenty-five miles an hour, he would have been looked upon as a lunatic.

With one exception, all the large torpedo boats belonging to the English navy are fitted to carry the Whitehead torpedo, and very deadly antagonists will such vessels be to ironclads in smooth water. As has been shown, the Whitehead is supposed to be effective within a range of 450, and sometimes of 600, yards. At these distances the torpedo boat will present but a very small mark to the ironclad, and the marvellous rapidity of her move-

ments will make the hitting her a matter of extreme difficulty. Naval gunners in these days can achieve a great deal, but—at night, at all events—it will tax their highest skill to hit a tiny vessel which is rushing through the water at the pace of a locomotive. If the Whitehead can be trusted to travel straight, it seems clear that an ironclad attacked in calm weather by several torpedo-boats will very possibly be sunk, in spite of watertight bulkheads innumerable in her hold. Whether the Whitehead can with certainty be sent absolutely straight does not seem to be quite clear; but, if all difficulties have not been surmounted, they will probably be surmounted before long, and very possibly the range will be increased. In rough weather torpedo-boats may not be of much use; but in smooth water they will be terrible enemies to a fleet attacking a port, or even perhaps to a blockading squadron.

Considering how much damage these viperous little craft are likely to do in war, it is decidedly unsatisfactory to find that we possess but a small number of them as compared with other nations. Of what the writer in the *Nautical Magazine* calls first-class torpedo boats—*i.e.* torpedo boats not carried on board ships of war—England possesses but nineteen. Russia is said to have a hundred, and France has fifty; so that we lag very far behind; and this is greatly to be regretted, as, in the event of a war, a fleet of torpedo boats could not be improvised. Of smaller torpedo boats, on the other hand, we have a fair number, as it is intended that most of our large vessels shall carry one or more of them. Some of these vessels can indeed use torpedoes without the aid of boats, as they are fitted with ports for the Whitehead; and one ship, the *Hecla*, is to fight entirely with these weapons. The extraordinary *Polyphemus*, intended to act as a torpedo ship and ram, and differing from any other war vessel yet built, will shortly be afloat. If, then, in one respect we are behind, on the whole we are fairly prepared with the means of using the remarkable weapon which modern science has devised.

That one of the principal results of modern science should be the production of marvellous implements of destruction is certainly not a very agreeable fact. A Government must of course accept powerful weapons of offence and defence which are offered to it, and when these are invented by soldiers or sailors whose duty it is to add in every way to the means of defence their country possesses, there is nothing to which even a humanitarian can object. They are indeed to be respected for the performance of an obvious duty. It is difficult to admire too highly such a man as Sir George Sartorius, who fought at Trafalgar and now suggests the *Polyphemus*. But the case seems different when civilians of great ability set to work to perfect elaborate engines of destruction, not for the purpose of defending their own country, but in order to sell them to any Government which likes to buy them. This may be a perfectly legitimate result of scientific knowledge and commercial principles, but nevertheless the spectacle of men thus engaged is not a pleasant one.

COPYRIGHT.

WE took occasion more than two years ago to call attention to the Report of the Copyright Commission appointed in 1876 by the late Government, which has not however as yet been made the basis of any fresh legislation. The subject is one of permanent and not inconsiderable interest, not only to the large and growing class of authors of all kinds but also to the general public, and we need make no apology for returning to it, even though under existing circumstances there may seem to be no immediate prospect of Parliamentary action being taken. This is just one of the cases where the public mind requires to be educated, and a juster and more general appreciation of the defects and inequalities of the existing law must eventually lead to the reform which is so urgently needed. As regards the abstract question, the extremest view on the one side was represented by Sir Louis Mallet, who dissented from the judgment of his fellow Commissioners, and maintained in a separate Report of his own the somewhat startling paradox that the claim to copyright rests on no solid foundation at all, that it is conceded solely in the interests of a class, and, by tending to restrict the supply of literature, is in direct conflict with the interests of society. He even considered the objection to taking away an author's copyright during his lifetime "a purely sentimental" one. We pointed out at the time that Sir L. Mallet was at fault alike in his facts and in his reasonings, and it is not necessary to repeat the refutation here. A writer in the current number of *Macmillan* maintains the opposite theory—for which he claims the support of such high authorities as Mr. Herbert Spencer, Mr. W. Longman, Professor Huxley, and Professor Tyndall—that there is no more ground either in justice or public policy for limiting property in literary production than for limiting any other kind of property, and that copyright should accordingly be universal both in time and place; that it should, *i.e.* be perpetual in time and should extend to all civilized countries throughout the world. This view is at least more plausible than the opposite one; there can indeed be little doubt that Mr. Grant Allen is right in principle on the latter point, and the Report accordingly insisted on the possibility and propriety of establishing an International Copyright Convention with America. That however is a part of the matter the settlement of which does not lie entirely within our own control. The Commissioners, with the exception of Sir Louis Mallet, took for granted the wisdom and necessity of legal security for copyright, and concerned themselves only with considering the imperfections of the existing law and the best methods of amending them. The actual law, though it is scattered over fourteen Acts of Parliament, was thrown into its present shape in 1842, and guarantees to an author the copyright in his works for forty-two years after the date of publication, or for seven years after his death, whichever period happens to expire last. It may be worth while briefly to recall the proceedings which resulted in this decision.

In 1814 the term of copyright had been fixed at twenty-eight years from the date of publication, so that it might easily expire during an author's lifetime, and the copyright of *Waverley*—as Miss Martineau pointed out—was in fact just about to expire at a time when its writer's family stood most in need of the honourable provision which his splendid array of works would have supplied to them. Wordsworth wrote poetry for fifty years with hardly any pecuniary remuneration. At the end of that time the sale of his works, under the amended law of 1842, began to bring him in about 300*l.* a year, and it is reckoned that it would now bring in about 1,000*l.* a year; but, with the exception of his latest composition, the *Prelude*, the copyright of all his writings has expired. Southey had given it to be understood that in the then state of the law he should undertake no more important works. Mr. Carlyle took a stronger step. He presented a petition to the House of Commons, setting forth his literary labours, from which he had as yet received no pecuniary recompense, and adding that such recompense would probably come, if at all, after his own death, but when those dear to him were still in need of it, and he therefore petitioned the House "to forbid extraneous persons, entirely unconcerned in this adventure of his, to steal from him his small winnings, for a space of sixty years after his death at the shortest. After sixty years, unless your Honourable House provide otherwise, they may begin to steal." If there was one member of Parliament rather than another who might have been expected to recognize the force of such an appeal it was Macaulay. But when in 1841 Sergeant Talfourd introduced a bill in accordance with Mr. Carlyle's wishes, Macaulay induced the House of Commons to reject it, and the mover not unnaturally complained that "literature's own familiar friend, in whom she trusted, and who had eaten of her bread, had lifted up his heel against her." Next year Lord Mahon introduced a Bill extending the time, not to 60, but to 25 years after an author's death. This modified proposal Macaulay again opposed, partly on the abstract and very questionable ground that all property is a creation of law, instead of being merely guaranteed and protected by it, partly on the strength of an ingenious but arbitrary hypothesis—for which he cited various detailed examples, chiefly from Shakspeare, Milton, and Dryden—that an author's latest works are almost invariably his best, and it is therefore for the public interest that the time of copyright should date from the publication of a work, not from the death of the writer. His enormous memory might readily have supplied him with an at least equally copious list of authors —like Charles Dickens—whose earliest works were confessedly among their best, not to add that many critics would dispute some of his literary judgments, *e.g.* on Milton's works; but he had taken up a theory, capable in his hands of brilliant and plausible advocacy, and unfortunately the House adopted it too, and fixed the existing law according to his suggestions. And whether or not we argue with Mr. Herbert Spencer for perpetuity of copyright, there can be no doubt that the guarantee of the existing law is a most inadequate one. It may be quite intelligibly argued that "the family of Milton or of Locke deserve as much from us as the family of Marlborough," whereas in fact the former derive no benefit from the labours of their ancestors and the latter enjoy in perpetuity a national pension of 4,000*l.* But at all events, when Mr. H. Spencer pointed out to the Commission of 1876 that after fifteen years' labour in philosophical writings he has been an actual loser to the extent of 1,500*l.* and at the end of twenty-four years had only just retrieved his position, he made out a strong case against a system which, had he died ten years ago, might have deprived his representatives of any profit from his extensive literary labours.

It is certainly mere matter of common justice that a man who devotes himself to authorship should be allowed to reap the pecuniary fruit of his labours rather than mere strangers. In France, Russia, Spain, and Portugal, the term of copyright is fixed at fifty years after the author's death; the Bill defeated by Lord Macaulay in 1841 would have fixed it, in accordance with Mr. Carlyle's petition, at sixty years; the Commissioners of 1876 suggest thirty years as the limit. That the only ground for limiting it at all, and therefore for the due measure of its limitation, must be sought in the real or supposed interests of the public is obvious enough. And it is by no means clear that in this matter the interests of authors and readers are so sharply opposed as is often apt to be assumed. Experience shows that it generally pays the author or owner of a successful work to publish cheap editions of it while his copyright still survives, and moreover it is well worth bearing in mind that, when once the copyright has expired the public has no security whatever for well edited editions of a book. Thus *e.g.* the first edition of Hallam's *Constitutional History*—a very defective and erroneous one—on the expiry of the copyright was at once reprinted by an adventurous publisher and sold to unwary customers as the genuine work. Or, to take an example cited before the Royal

Commission, editions of Wordsworth's Poetical Works are now on sale, as though complete, with the *Prelude* omitted, of which his heirs still retain the copyright. Macaulay argued with a somewhat far-fetched ingenuity that if copyright was permanent, the *Pilgrim's Progress* might become the property of a High Churchman who would feel bound to suppress it altogether. Under the existing law however the *Pilgrim's Progress* has actually been, not suppressed but "adapted" in his own sense by a High Church editor, whose procedure might perhaps have proved even more displeasing to John Bunyan than suppression. Similar mutilations of other works, especially of popular hymns, whether on some fixed principle or from mere carelessness or caprice, are notoriously common enough. Complaints, for instance, have already been made of the *Christian Year* being tampered with in editions published during the last few years since the copyright expired, and in ways affecting not merely the rhythm but the doctrinal sense of the original. As regards the commercial side of the question, Mr. Herbert Spencer has shown it to be fairly arguable that with a permanent and international copyright books would become cheaper than at present, nor should it be forgotten that whatever tends to improve the condition of authors must conduce in the long run to the advancement of literature. We are not however dogmatizing here on the permanence or the precise duration of copyright; we are simply insisting that the present term is at all events much too short a one and ought to be extended in the interest alike of the author and of the public. And this construction is distinctly borne out by the verdict of the Royal Commission of 1876, whether or not their proposal for extension be deemed a sufficient one.

There are two special applications of the principle, noticed in separate sections of the Report, on which we have not left ourselves space to dwell at length here. But it must be acknowledged that, if the existing system of copyright is altogether inadequate and unsatisfactory, the grievance presses with exceptional severity on dramatic authors and on artists, as well from the confusion and uncertainty of the law as from its positive injustice. As regards dramatic works and the dramatization of novels the author's rights are either ignored or are involved in hopeless perplexity, while artists have no rights at all—unless by express stipulation—over pictures or statues they have once sold. The remedy, however, suggested by the Commissioners in this last case would be almost worse than the disease. Sir James Stephen argues oddly enough that there ought to be no copyright in pictures or statues; and the Report, while recognizing the necessity of some definite settlement and admitting that artists are unanimous in desiring to have the copyright reserved to themselves, nevertheless advises, with a strange perversity, that it should be vested not in the author but in the purchaser. This recommendation is the more surprising as the Commissioners propose to remedy the anomalies and injustice of the present law in its bearing on dramatic works and dramatized novels by securing the rights of the authors. It is much to be desired that the whole question should be brought at the earliest date practicable under the notice of the Legislature with a view to the thorough revision of the existing law.

THE CATTLE SHOW.

The Cattle Show which has been held at Islington this week differs from its predecessors in one very important particular; it is to a much larger extent an exhibition of young stock. There are classes for all the precocious breeds, and those breeds are beyond all precedent well represented. It is probable that consumers, being every year more and more collected together in towns, and consequently living less in the open air and taking less violent exercise, may have lost the taste for very fat meat. If this be so, it would be natural that feeders should accommodate themselves to the altered taste, and should produce for the market younger, juicier, and less obese animals. But, though we do not deny the possible influence of this new fashion, we are inclined to think that the real operating cause of the change is different. For a long time after the adoption of free trade, grazing farmers were under the impression that they were safe from foreign competition. A certain number of fat oxen, indeed, were imported into London, principally from Holland, Holstein, and Jutland; but these were only just sufficient to prevent any formidable attempt at competition. At length, however, the construction of cheap railways abroad, more particularly in America, the multiplication of steam shipping, the progress of mechanical invention, the accumulation of wealth, making it possible for new communities to improve the breeds of their flocks and herds, the steady growth of demand at home, and the stationariness of the native supply, made competition possible in this branch of agriculture as in others. We have seen the dead meat trade from the United States within the past few years assuming considerable proportions, and we have also seen a large importation of live cattle. Those who have studied the subject on the spot are of opinion that the trade is only in its infancy, that it is capable of very great development, and that men of enterprise and ingenuity, with any amount of capital that may be required ready to be placed at their disposal, are devoting their attention to that development. Where the United States lead the way there are countless imitators prepared to follow. Thus the grazing farmers now find themselves threatened with the same fierce competition to which the tillage farmers have long been exposed. Obviously, if they are to hold their own, they must rouse themselves out of the routine they have hitherto followed. While the population of the country has been growing so fast, while wealth has been accumulating, and wages rising so rapidly that classes which formerly never touched meat are now good customers of the butcher, the farmers have not altogether kept pace with the times. In consequence, the supply of meat, even though supplemented from abroad, has fallen short of the demand, with the result that prices have steadily risen until checked by the recent severe depression. Evidently, if this state of things continues, a premium is offered to the foreign importer. So long as wealth and population increase in this country, stimulating the consumption of meat, the only check that can be imposed upon importation must proceed from the British farmers themselves. They must not only make it their business to provide the requisite supply, but they must furnish it at a price lower than will pay the foreign importer. If they cannot do that, they in effect offer a premium to the foreign importer. And the higher the price rises above the point that will pay the importer, the greater the premium. The real problem before the British farmer, then, is to reduce the cost of production, or, in other words, to cheapen the rearing and fattening of cattle. There are various ways in which this may be done, and one of them is to shorten the period over which the process extends. Just as every year that wine is kept augments its cost, so the older a beast is when brought to the shambles the more it costs. The direct outlay upon it is larger, and so is the interest of the money expended. The change which is passing over British cattle-farming, of which we have had visible demonstration this week at Islington in the precocity of the breeds and the youth of the beasts exhibited, shows that our farmers are coming to recognize the new conditions under which their business must be carried on. It remains to be proved by experience whether precocity is in actual fact as economical as in theory it appears to be. It may be, for instance, that animals which fatten while they are yet immature are more delicate than the slower-growing breeds and more liable to disease, and that, if the system were adopted generally, they would suffer from so much higher a rate of mortality as to neutralize the advantage which precocity undoubtedly gives. It will probably be found that the new fashion, if it prevails, will involve an abandonment of much of the old unscientific system of cattle-farming; that is to say, the land of the country will not be laid down in grass upon which the cattle will be turned out to feed as if we were still in the nomad state, but cattle will be scientifically fed under cover that will protect them from the inclemencies of the weather.

However things may ultimately turn out in this respect, the Show at Islington this week has given no reason to doubt the wisdom of the change that is going on. There were no monsters of fat, but the beasts exhibited were highly fed and of excellent quality. In this latter point the Show leaves nothing to be desired. In another respect it was less satisfactory. It was very scanty. There were, for example, only 207 entries of cattle, against 239 last year; and only 138 pens of sheep, against 150 last year; but there were 52 pens of pigs, against 50 last year. The falling-off is not due to want of encouragement, for the prizes offered exceeded 3,000*l.* Partly it was caused by the limit of age imposed, partly by renewed apprehensions of disease; but chiefly, we are afraid, by the widespread agricultural distress. Grazing counties, it is true, have not generally suffered as much as the tillage counties, although it is to be borne in mind that the excessive wet, the absence of sunshine, and the dreary cold of 1879 bred an epidemic among sheep which caused disastrous losses, and fully accounts for the decrease in the numbers exhibited. Cattle farmers, no doubt, have not suffered so much either as flockmasters or as tillage farmers; yet even they have felt the bad times, and their landlords have had to complain of vacant farms and of the abatements they have had to make to tenants. Under these circumstances it is not surprising that the number of persons willing to undergo the cost of rearing and feeding animals for exhibition should be growing less and less. Nor is this perhaps so unsatisfactory a symptom as at first sight it may appear. Practically, an exhibitor must begin to prepare the animals he intends to exhibit from their very birth, and must relax none of his attention while they are being reared and fed. The animals must be of good breed, or the whole thing is waste of time and money; and they must be absolutely without blemish. It certainly is no cause for wonder that the experience of the past two years has damped the courage of farmers who otherwise might have exhibited. It is rather a matter for congratulation that so many have persevered to the end. Fluctuations of this kind would be of little permanent significance if the flocks and herds of the country were increasing; but, unfortunately, that is not so. The agricultural returns noticed by us two months ago prove, indeed, a decrease in milch cows, and only a slight increase in cattle for feeding. And, if we go back ten years, we find the increase inconsiderable, especially when we bear in mind the great addition made in the interval to the land laid down in permanent pasture. This is the really unwholesome symptom of our agriculture. Except when extreme depression of trade and foreign competition combined to break down the market, prices have been very high during the past ten years, and there was thus a strong inducement to augment production. At the same time a

large increase was made in the acreage of permanent pasture, and yet the addition to our herds is trifling. We admit, of course, that breeds were improved, but certainly not to the extent to which they were improved in the United States. It would seem to follow, therefore, that, in spite of the inducement held out in the form of high prices for the past quarter of a century—inducement which has proved strong enough to stimulate American feeders to devise means of supplying the English market—the requisite amount of new capital has not been invested in cattle-farming at home to turn to account the addition made to the grazing land, or, if the new capital was invested, it has not been directed by adequate skill. We have in England such a superabundance of loanable capital seeking investment, that for many years past capitalists have been complaining that they knew not what to do with the funds at their disposal. Why is it that some part of these funds has not gone into cattle-farming, if there really has been a deficiency of capital? And if it is skill that has been lacking, how is it that of all English industries farming alone should be deficient in skill? These questions are well deserving the careful consideration of the landed interest.

The Scotch cattle exhibited at Islington were less numerous than those at the Birmingham Show, where they formed almost half of the entries, and carried off nearly all the prizes open to them; but in proportion to their numbers they were scarcely less successful. The fact is another proof of the good seasons with which Scotland has been favoured during the past two years, and of the consequent prosperity of her agriculture. While in England sheep were dying last winter by hundreds of thousands from "fluke," induced by excessive wet, in Scotland there was no such disease, and the crops, too, were fairly good. This year, again, has been one of the best, north of the Tweed, that have been known for a generation. The only fault that could be found with it, indeed, was that there was not enough of rain. The result has been that Scotch agriculture has not been tried as English agriculture has, and that Scotch farmers have had the courage to send their cattle to English shows, and have been rewarded by a large measure of success. That dependence upon the weather of which we have here again an illustration is, no doubt, a peculiar difficulty of agriculture. The manufacturer has to some small extent the same difficulty to contend with, as he usually gets his raw material from agriculture; but even when this is so, he is generally able to recoup himself by raising the price of his goods. As a rule, too, the markets of the world being open to him, and the raw material constituting but a small portion of his cost, he is no worse off than his foreign competitors. But under free trade the farmer has to bear the greater part, if not the whole, of the loss caused by bad seasons. There is not, therefore, the same scope for foresight, calculation, and skill in farming as in trade. Do what he will, the agriculturist is far more helpless in face of the elements than the merchant and trader.

THE THEATRES.

THE welcome return of Mr. and Mrs. Bancroft to the Haymarket Theatre has not been marked by any new production. The late Mr. Robertson's play *School* was successful in their last season and is successful still. It is not the best of the author's plays in constructive skill, having been grafted from a German to an English soil, with the result of the process involving some incongruities in spite of the dramatist's skill. It would be easy enough to hold up a great deal of the piece to the ridicule of readers; more easy perhaps than to explain exactly its influence upon spectators. The play has some capital faults, the worst of which artistically is perhaps the cruel suspense in which old Farintosh is kept in the last scene in consequence of his nephew, Lord Beaufoy's, resentment of the unjust, but thoroughly natural, suspicion with which he finds himself regarded. But it must be remembered that, on a first hearing at least, Farintosh's suspense is shared by the audience, and that to keep an audience in interested suspense is one of a dramatist's most legitimate and most useful expedients. Probably the simplest and the truest explanation of the success of this and others of Mr. Robertson's comedies is that he knew the stage thoroughly. He had gauged the capabilities of his interpreters and of his listeners; he knew what effects would be, on the one hand best given, on the other best received; and he knew how to lead up to these effects without making them seem hurried or thrust in merely for the sake of effect. Above all, he managed to give a human interest to his work, which will, to our thinking, save it from the extinction which some critics have foreseen for it. He dealt with a particular period and phase of manners, and in putting this on the stage, he sometimes exaggerated, sometimes misrepresented, and sometimes made blunders; but his personages had, for the most part, a real likeness to humanity underlying, and being of more import than, the trappings, whether of dress or manner, which they happened to wear. Take, for instance, the love scene between Lord Beaufoy and Bella in *School*. Its delicious inanity is closely connected, in the form of words which it takes, with a particular habitude of manner; but the feeling of the scene is not more true to one period than to another; and when well acted, as it now is, it pleases just as much on the third or fourth repetition as it did when first produced. The contention that real emotion, struggling bashfully with habitual restraint and assumption of indifference, can be confined to any particular period, does not, on the face of it, carry conviction. The well-known amateur of the drama who a few years since published a monograph on Robertson hit a truth which was perhaps obscured by the startling comparisons in which in the course of his work he indulged. The success of Robertson's plays is surely due to the fact that he knew what sentiments would be recognized as true to nature by the whole of his audience; and that, being a practised playwright, he knew how to express these sentiments in the best way both for his actors and for his audiences. As the writer to whom we have referred said, "The theoretical critic who believes in nothing but physical action and anecdotic plot is puzzled when he encounters a piece like *School*, absolutely without story, which had one of the greatest runs on record, and has to confess that there may be more things in art than are dreamt of in his philosophy." The same writer goes on to observe that in Robertson's social life comedies what was remarkable was, "not that he failed in exactly depicting its usages, but that he so far succeeded—and when he fails, it is often in compliance with some stage effect." Probably most of our readers are tolerably well acquainted with the play of *School*, and we need not add any detailed account of the particular piece to these general remarks on the author's method.

As at present performed at the Haymarket the piece goes, if possible, better than before. Mrs. Bancroft's delightful rendering of Naomi Tighe seems, if anything, to have gained in brightness. Mr. Bancroft's Jack Poyntz, Mr. Conway's Beaufoy, and Mr. Kemble's Dr. Sutcliffe have all their old attractions; and in Mr. Kemble's case there is, it seems to us, here and there a decided improvement. Mrs. Canninge and Miss Marion Terry play as well as formerly the parts of Mrs. Sutcliffe and Bella, and Miss Terry's graceful and interesting performance suffers only from an occasional excess of slowness. A new and markedly successful feature in the cast is Mr. Brookfield's acting of Krux. In Mr. Brookfield's hands Krux becomes for the first time a personage who seems at once life-like in himself and not out of keeping with the rest of the play. The notion of meanness and cruelty suggested insensibly by the actor's original and very ingenious make-up and costume is never lost sight of and never unduly obtruded throughout the course of the play. It is conveyed in every intonation, look, and gesture. Mr. Brookfield has now got rid of the constraint of action which on former occasions sometimes stood in his way, and he seems to have learnt completely the difficult art of standing still while he listens to the conversations of other people with an air of naturalness. His walk is throughout characteristic, and his run up the steps at sight of the indignant Doctor's uplifted stick is irresistibly comic without being overdone. We have kept to the last a renewed expression of our admiration for Mr. Arthur Cecil's acting throughout the piece, and especially in the last act, where the old man, having thrown off his foppish assumption of youth, bursts into a storm of conflicting emotion which is the more pathetic by reason of its helplessness.

School is preceded by *The Vicarage*, a piece adapted from, or rather founded on, M. Feuillet's *Le Village*, by Mr. Clement Scott. The piece has some obvious faults, which we pointed out when it was first produced, and need not now recur to. It is remarkable as giving the three principal actors concerned in it an opportunity of displaying a versatility which is not too common an accomplishment. There are few actresses capable of performing the feat performed by Mrs. Bancroft of appearing in this piece as an old country vicar's wife, quiet and gentle in nature and manner, who is happy in having no interest beyond the joys and woes of the people immediately around her; of appearing in the next piece as a light-hearted, pert, and charming school-girl, and of playing both parts as well as one can imagine their being played. Mr. Bancroft, who appears for the first time as George Clarke, the vicar's travelled friend, has an unusually difficult part to play. It is not only that Clarke is an entirely different personage from Jack Poyntz, but that the good traits which he displays at the end of the piece are heavily discounted by the extraordinary ill-breeding attributed to him at the beginning. In dealing with this part Mr. Bancroft shows, as he has shown on other occasions, that he has a distinct power of impersonation, and he manages to make the amazing remarks put into the traveller's mouth concerning his host's entertainment as little startling as may be. Mr. Cecil's Noel Haygarth is a very delicate and life-like performance, and Mr. Stewart Dawson's quiet and clever acting as the old butler is highly commendable.

At the St. James's Theatre a version by Mr. Coghlan of M. Octave Feuillet's *Le Roman d'un Jeune Homme Pauvre* has been produced under the not very appropriate title of *Good Fortune*. Two former versions of the French play have been put upon the London stage, as to one only of which, *A Hero of Romance*, we can speak from experience. This was arranged by Dr. Westland Marston for Mr. Sothern, whose talent was not perhaps seen at its best in the part of the hero. But, although there was not so much "smart" writing in Dr. Westland Marston's version as in Mr. Coghlan's, it was, to our thinking, at once better written and better adapted to stage purposes. In Mr. Coghlan's piece the old man upon whose tardy repentance the hero's restoration to his lost fortune turns, is a personage who is a good deal talked about, but never seen, and the adapter has provided a new catastrophe which is not particularly fortunate. The virtue of the hero's flinging into the fire the letter in which his employer confesses that, if right were done, his estate would belong to the hero, is unhappily discounted by the fact that the document has

not, for anything that we could discover in the dialogue, one shred of legal value. If Lord Neath, masquerading as Mr. Denis, had, after reading the letter, followed up his not unnatural desire to claim, and belief that he could claim, the estate, the people to whom he applied might have met him with an acknowledgment that the letter seemed on the face of it to be genuine, but also with a question as to what kind of use he proposed to make of it. No doubt the feeling which prompted Mr. Denis to destroy the letter was chivalrous enough in all conscience; but, for all practical purposes, what he threw into the fire might as well have been an unpaid bill. As there is a want of purpose and motive here, so is there at other important points of the piece. The brief reference given by Isabel Ransome to hints which have been heard by her, but scarcely, if at all, heard by the audience, cannot make her suspicion of the hero's conduct seem anything but gross and unnatural. Her jumping to the conclusion that Denis has purposely contrived their being left alone together, locked up in a ruined castle at nightfall, is, as presented in the play, utterly unaccountable, and serves to accentuate the unpleasant qualities of a part which has but too little relief in the first act. The same want of skilful arrangement militates against the notion sought to be conveyed in the first act that Mr. Denis is a person of Crichton-like accomplishments. His sketches are dragged in by the head and shoulders, and his offer to play the piano seems a trifle forced. The suggestion of his riding and vanquishing a nasty-tempered horse is managed much as it was in the play in which Mr. Sothern appeared, but seems to miss the sense of excitement which was then imparted to it. Again, the strong scene in the second act in which the governess makes love to the hero, is modified in a way which is more ingenious than successful. The lines are in their way admirably written; the suggestion is made quite plainly enough for those who already know the story, but not, we think, plainly enough for any playgoer who has still to find out what is the exact course of the play. As to the "smart" writing to which reference has been made, it is less fortunate than might have been anticipated from Mr. Coghlan's experience. There are, no doubt, stupid, soltish, and heartless young men of all ranks of life in the world; but it is simply ridiculous to represent one young man saying to another who has been his friend, and who, as he knows, is ruined, "I should like to do something for you. Have a weed? It's a good 'un, and there are only two left, so you can't say I'm mean." This sentence, the words of which we quote from memory, is uttered by Mr. Tom Bolger; but the whole part of Sir George Fallow is made up of sentences, if possible, yet more astonishing. His manners resemble closely those of the fellow-commoner who figures in the ridiculous book called *Julian Home*. The acting of the piece makes one wish all the more that the play were better. Mrs. Kendal, heavily weighted as she is with an unnatural and unattractive character, makes the very most that can be made of the lighter passages, and acts admirably in the more emotional parts. Mr. Kendal's character is at least consistent in its impossibility, and he plays it with grace and fire. Mr. Clayton seems to have been not unnaturally puzzled by the outrageous part provided for him, and has taken possibly the best course that he could take in strongly accenting its peculiarities. Mrs. Stephens is as usual inimitably funny as Lady Banks, Miss Linda Dietz plays Miss Somers with considerable skill, and Miss B. Buckstone and Master McConnell act two children's parts capitally. But the whole effect of the piece is neither exciting nor pleasing.

The run upon Mr. Booth's performance of Richelieu has for the present interfered with his original intention of not appearing in any one part for more than a fortnight together; but it is greatly to be hoped that it will not prevent him from exhibiting his powers in a varied range of parts before he leaves us.

REVIEWS.

YOUNG IRELAND.*

THE original proprietor and editor of the *Nation*, which was the organ of the party once known as "Young Ireland," records, with an enthusiasm unabated by years or variety of political experience, the early efforts of himself and his associates. Sir Charles Duffy has many qualifications for his task. With great ability and much literary experience he combines an earnest belief in the justice of his cause; and it may be added that he always writes in the language and the spirit of a gentleman. His invective is seldom personal, and he never condescends to coarseness or buffoonery. Although it is impossible that any loyal Englishman should accept his conclusions, his statements are never wilfully inaccurate, and his arguments are often forcible. That Ireland has often been treated with injustice is undeniable; but that it should be constituted into an independent and probably hostile State is not an admissible inference. The issue which Sir C. Duffy raises must ultimately be decided by a comparison, though not necessarily by a conflict, of forces. One part of the book may be read even by opponents with almost unmixed pleasure. The contributors to the *Nation* were at the commencement of their enterprise all under the age of thirty; and congenial dispositions, still further harmonized by a common task, united them in warm youthful friendship. Like all other societies of the same age and character, they by common consent elected one of themselves to be their leader and hero. Their historian believes as implicitly in his later age as in his youth, that Thomas Davis was a man of genius; and perhaps he may be right. His zealous loyalty to the memory of his friend finds repeated and eloquent expression in all parts of his work, and especially when he recalls his own profound sorrow for his death. It can scarcely be admitted that Davis's character and achievements entitled him to the attribute of greatness. At most, he was one of "the inheritors of unfulfilled renown"; and his early death saved him from participation in the ignominious failure of a mischievous and hopeless enterprise. If he had lived three or four years longer, he would have engaged in the rebellion which he had from his entrance into political life done his utmost to promote. It is impossible not to sympathize with Sir Charles Duffy's personal attachment; and it is an open question whether disinterested enthusiasm redeems from censure a fundamental mistake in a political career. There is no reason to doubt the justice of Sir C. Duffy's tribute to the moral elevation of the young confederates. "The passion for liberty had burned up the trivialities of youth, and cleared their lives of foppery and licentiousness." A whimsical protest against the charge that they were a "mutual admiration society" cannot be unconditionally admitted. All similar bodies are liable to the imputation; and the Young Irelanders might be excused for overrating one another's contributions to the common enterprise. Knots of clever young men are always sanguine of a success which seems to be due to the merits of themselves and their friends; but they seldom have the opportunity of believing on plausible grounds that they are the principal agents of national regeneration. The extracts from their occasional private correspondence on personal topics are fresh and natural, but in no way remarkable. The still fewer quotations from the verses of the *Nation* bear little trace of poetical faculty. The temporary and partial success which was achieved by the Tyrtæuses of Repeal might be described in the words of a perhaps invidious criticism on a German poet and patriot. Körner, it was said, hobbled on to immortality like a lame duck, on one leg and one wing, as a versifier and a soldier. Some members of the body might perhaps have become great if they had been favoured by fortune; and all Sir C. Duffy's early assistants in the conduct of the *Nation* appear to have been unselfish and sincere. The present volume ends with the death of Davis, on the eve of the collapse of the Repeal Association, and of the succession of the Young Ireland party to the conduct of the agitation on the retirement of its founder and leader. There had for some time been strong feelings of irritation between the two sections of Repealers; and Davis had on more than one occasion come into direct collision with O'Connell. The Irish leader had, according to Sir C. Duffy, fallen under the influence of his son, John O'Connell, who hoped, like Garibaldi's sons, to succeed to the position of his father. The tendency of the profession of agitator to become hereditary is a curious illustration of the natural family ambition which is denounced by democrats and socialists. The remaining volume is to record the conspiracy and the abortive insurrection which were the consequences of the teaching of the *Nation*. Smith O'Brien, Mitchell, and Meagher will probably occupy in its pages the position which had been vacated by Davis. It is to be hoped that Sir C. Duffy will provide his readers with an index, and that he will condescend to the ignorance of readers by supplying dates. In a volume of 700 pages, it is almost impossible to discover, except by independent recollection or research, the year in which any event after 1841 happened. That the Maynooth Act was passed in 1845 may be deeply impressed on Sir C. Duffy's mind; but after five-and-thirty years his contemporaries may imperfectly remember a fact which is probably unknown to the younger generation.

Mr. Duffy, with Mr. Dillon and Mr. Davis, founded the *Nation* in 1841. From the first the literary associates devoted themselves to the cultivation of national Irish sentiment; and the popular sympathy with their objects, combined with their own energy and ability, procured for their journal considerable circulation and influence. In the laudable task of teaching Irish history to their countrymen, it may be conjectured that they were not minutely critical. Sir C. Duffy's fourth chapter, which is called "A Bird's-eye View of Irish History," begins with the statement that, fourteen centuries before the Christian era, "an expedition of Celts from Spain, led by a chief whose name in its Latinized form is Milesius, landed on the island, and after some fierce fighting, obtained possession of it." It would perhaps be safer to assert that Milesius came to Ireland in the same year in which Brutus, the son of Æneas, gave his name to Britain, and Scota, the daughter of Pharaoh, to Scotland. As Sir C. Duffy in the next sentence jumps over 2,500 years to the arrival of the Normans, no practical consequences follow from the Milesian conquest. The *Nation* seems, as might have been expected, to have accepted the historical doctrines of Thierry, whose authority has not increased in recent times. If the antagonism of subject races to their conquerors is the origin of modern revolutions, it is difficult to understand why Davis, whose father, descended, as the name implies, from a Welsh family, himself belonged to Buckinghamshire, should have been an Irish rebel. His maternal grandfather, of good Yorkshire descent, had happened to settle at Mallow, where Davis was born.

The Young Irish party, though as writers they pursued an independent course, took part in O'Connell's Repeal Association,

* *Young Ireland; a Fragment of Irish History*, 1840-1850. By Sir Charles Gavan Duffy, K.C.M.G. London: Cassell, Petter, Galpin, & Co.

which became more and more formidable. In and out of the press they and their associates had talked sedition or treason for two or three years, when, in 1849, Sir Robert Peel, in answer to a question in the House of Commons, repeated a former declaration of Lord Althorp, that he would resist the Repeal of the Union even if the alternative were civil war. O'Connell and his allies of course expressed surprise and indignation at a menace of force directed, as they said, against a constitutional agitation for the repeal of a simple Act of Parliament. Sir Robert Peel may perhaps have committed a verbal indiscretion in denouncing their obvious purpose, rather than their ostensible method of proceeding. It was perfectly natural that both O'Connell and the writers in the *Nation* should attribute to the Minister the first appeal to force; but it is strange that Sir C. Duffy should, after a long interval, blame Sir Robert Peel for his acceptance of a challenge which he and his friends had again and again openly offered. Their efforts had been directed, not to the repeal of an Act of Parliament, except, perhaps, as a preliminary measure, but to separation from the Crown of England and to the establishment of an independent State. Sir C. Duffy more than once complacently quotes the doctrine of the *Nation* that Ireland should have a foreign policy, which, as he explains, meant alliance with France or America, or with both, against England. Mr. Seward, Mr. Greeley, and other conspicuous American politicians, had insolently offered assistance to Ireland in rebellion against the Imperial Government; and Mr. Tyler, then President of the United States, had with gross indecency expressed his sympathy with the cause of Irish independence. The sweet singers of the *Nation*, among many effusions of similar tenor, had composed lyric strains in honour of Akbar Khan, solely on the ground of his treacherous massacre of English officers and soldiers. If any other criminal had committed an atrocity injurious to England, his exploit would have been applauded in the columns of the *Nation*. It was absurd to express angry astonishment at the defiance of their threats by a Minister who paid them the undeserved compliment of assuming that they were in earnest.

A similar criticism may be applied to Sir C. Duffy's elaborate discussion of the proceedings for conspiracy against the leaders of the Repeal Association, of whom he was one. Few readers will be deeply impressed by the contention, overruled by the majority of English judges, that the judgment was vitiated by errors of procedure, or by want of correspondence between the judgment and the record. The law of conspiracy is undoubtedly cumbrous, as the traversers found to their advantage; but martyrs, though they may have a right to profit by legal quibbles devised by special pleaders, ought not to be too indignant when they are accused of the acts on which their reputation depends. If the jury panel was wrongly struck, if Mr. Peacock's objections to the record were well founded, it was still true that the speakers in the Association and the writers in the Repeal press had devoted all their energies to the prosecution of rebellion and civil war. Even if it were held that they were morally justified in their efforts by the condition of Ireland, it is unreasonable to blame an established Government for asserting its own existence. The prosecution, though the judgment was reversed by the House of Lords, had the effect of silencing O'Connell. He was nearly seventy, his health was perhaps already breaking, and Sir C. Duffy mentions for the first time the curious fact that O'Connell was at the time deeply in love with a young lady who afterwards declined to marry him. Sir C. Duffy and his friends had been deeply disappointed by O'Connell's submission to the mandate of the Government by which the Clontarf meeting was prohibited. It was true that he had repeatedly announced his determination to resist; but his error consisted, not in practical recognition of superior force, but in previous bluster. The patriots of the *Nation* knew as well as O'Connell that no preparations had been made for the rebellion which had so long been threatened. It would have been a folly and a crime to provoke a collision between the troops and the multitude which would have crowded a monster meeting.

Sir C. Duffy does justice to Sir Robert Peel's bold and wise policy of conciliation, which was unfortunately interrupted by the famine and by his own retirement from office. He also remarks on the grudging support and the factious criticism of the leaders of Opposition, especially of Lord John Russell and Mr. Macaulay. The endowment of Maynooth, while it excited clamour in England, was gratefully accepted by the Roman Catholic prelates and priesthood, and even by the Repeal Association. The foundation of the Colleges which were afterwards affiliated to the Queen's University widened the difference between the Young Ireland party and the followers of O'Connell. Sir C. Duffy and his friends were anxious to secure the opportunity of liberal education for the Irish middle class; and, although they objected to some provisions in the Bill, they saw the possibility of effecting a compromise. O'Connell and his son, on the other hand, borrowed from Sir Robert Inglis the foolish nickname of "godless colleges"; and, although they failed in their attempts to defeat the measure, they did their utmost to create the noxious prejudice which has deprived a later generation of academical training. This controversy gave occasion to the conflicts between Davis and O'Connell which ended, after the death of the Young Ireland leader, in the disruption of the Repeal Association. The more upright and zealous section of agitators had been consistent in their desire to qualify their countrymen for the independence with which they hoped to endow them. They established reading-rooms; they published and circulated books in which their version of patriotism was inculcated; and they even hoped to achieve the desperate task of detaching the upper and middle classes from their attachment to the English connexion. Their story is well told by their surviving colleague. His eloquence will perhaps revive the memory of Young Ireland among the disaffected portion of his countrymen, but it will scarcely win an English proselyte. When Sir C. Duffy asks why there are no manufactures in three out of four Irish provinces, when he complains that the Irish seas teem with fish which are not caught, and that the harbours are empty of merchandise, he virtually condemns, not the legislation or government which give every facility to industrial enterprise, but the incurable turbulence which drives away capital and confidence from Ireland.

LIFE OF SIR ROWLAND HILL.*

(*First Notice.*)

IT is very easy to understand the difficulties which must have beset Dr. Hill in the editing or writing of this book—difficulties which indeed he indicates in his preface. Biography is always a very difficult task. If the biographer and his subject have been strangers, the writer sets to his work with one hand tied. If they have been friends, and still more relations, he is frequently hampered with a knowledge of the wishes of the deceased which prevents him from putting himself quite at the standpoint of the ordinary reader, and he is likely to lay most stress on things which are not of the most general interest. But Dr. Hill's case was worse than this. He was not even left free to write such a biography as might seem best to him, nor had he, on the other hand, the comparatively light duty of merely editing an already written autobiography. Sir Rowland Hill had in his lifetime written, and it seems printed, a voluminous History of Penny Postage, which, it need hardly be said, was an autobiography in all but the name. But, in the first place, this narrative passed over the first, and by no means the least remarkable, half of his life. For, though the present generation only thinks of him in connexion with his Post Office reforms, it must be remembered that, years before, it seemed at least possible that he would go down to posterity as the reformer, not of English postal arrangements, but of English schools, while even this great addition does not exhaust the list of the results of his untiring inventiveness. Moreover, absorbed as he was in the work which had been the delight and torment of his manhood, he had, as we can very readily believe, and can indeed see from this book, allotted far too much space to the mere technical details of his fight with the Post Office authorities, to the exclusion of matters of more personal and general interest. It is only a generation which has actually fought at the Alma, or has had friends fighting there, that can endure the recital of that battle in several hundred pages. Sir Rowland had apparently recorded his successive Almas very much in this way, and his nephew has had, in accordance with counsel which he tells us he gave his uncle in his lifetime, to retrench the record very considerably. Even as it is, we are inclined to feel a doubt whether he has gone quite far enough in this direction. A thousand large and closely printed pages make a somewhat dangerously bulky monument to lay on the grave of a man whose life, though probably of greater importance to the country than that of all but a very few of his contemporaries, had but little of moving incident in it. But, on the whole, Dr. Hill has probably done well to make this first edition of his uncle's life complete enough to be a book of reference for all who are interested in the subject. He may very likely have an opportunity of preparing a more popular edition, and then he would be well advised to abandon the division into history and autobiography altogether, to include only a few extracts from Sir Rowland's own work, and, giving his own share of the book intact as it now is, to refashion the rest in the same style and form.

If the actual national importance of the second half of Rowland Hill's life surpassed that of the first half, we are inclined to think that the history of the first half is, from the purely biographical point of view, the more interesting of the two; and in this first notice we shall confine ourselves to it, reserving the active official life for another occasion. The family in which Rowland Hill was the third son was as remarkable for the longevity of its members as for their intellectual distinction. A singular proof of the former family characteristic is given by Dr. Hill in the remark that his great-uncle volunteered against the Pretender; that is to say, men now living familiarly knew a man who had arrived at full age a hundred and thirty-five years ago. As to the second, it is sufficient to say that, of a large family, assisted in no way by birth or connexion, and in their early days positively poor, almost every member made his way to considerable eminence in his profession, or in official station. Sir Rowland Hill's father was at first a tradesman on a small scale. But in the early years of the century he opened a school, and this school, when his sons grew up and took a share in it, rapidly became famous. Mr. Hill the elder was a stanch Liberal of the old doctrinaire school, believing implicitly that Toryism had made the world a desert, and that Parliamentary Reform, Free-trade, cheap books, and instruction, &c. &c., would it make it a paradise. There is something touching enough (when we look back at the thing through what has happened since) in the *Nunc dimittis* of joy which, as his grand-

* *Life of Sir Rowland Hill, K.C.B., and History of Penny Postage.* By Sir Rowland Hill and George Birkbeck Hill, D.C.L. 2 vols. London: De La Rue & Co. 1880.

son tells us, the old man uttered at the Great Exhibition of 1851, which was opened a few months before his death. He was, however, by no means a mere politician; he was also a fervent student of natural science. But, though he was in many ways well fitted for a schoolmaster, he seems to have lacked the firmness of hand and the spirit of discipline which are above all things requisite. These, however, were amply supplied by his sons when they came to take the reins, and the school at Hazelwood (whither it had been moved from Hill Top, its first abode) soon, as we have said, became famous. Rowland Hill and one of his brothers published a pamphlet explaining the singular system of education which they had perfected, and which long continued to be carried out. Everything was done by code, and the code was administered by a constitutional government elected by the boys themselves. Even the judicial department was in the hands of delegates of the probable culprits. These things naturally rejoiced the souls of Bentham, Mill, Brougham, and others of the straitest sect of the utilitarian and useful-knowledge perfectionists. But there came a time when they thought of showing their joy in a manner very dubiously gratifying to the Hills. These latter, by almost superhuman labours, had made a position for themselves, and had at last reached the possibility of affluence. Time had been when the young Rowland, to get money for his studies and experiments, had had to sell herbs out of the garden and to resort to other similar expedients. Now they had a school with over a hundred pupils, and more were being constantly pressed on them. It was evident, however, that if, as the leading London Radicals had some idea of doing, a school on the same plan were set up close to the capital, the prestige, and with it the profit, of Hazelwood would be in not a little danger. In the Hill family everything was settled on constitutional principles by a family council; indeed the very expenses seem long to have been conducted on the budget plan, and so much, we suppose, was voted to each brother as he required it. The family council now determined to anticipate the danger by themselves establishing a metropolitan Hazelwood. The site chosen was Bruce Castle, at Tottenham; and Rowland Hill, with his system and one of his brothers, migrated to this new home.

A great deal of interesting information as to this curious system of education is to be found in Dr. Hill's pages. One naturally asks, How did it succeed? Dr. Hill does not in so many words answer this question; but he very fairly gives quotations from which the reader can draw his own conclusions. The personal force and energy of the able men who worked it no doubt got far better results out of it than might have been expected, and prevented the catastrophe which must have occurred had one or two clever and ill-disposed boys made use of the opportunities of revolt against a weak or incompetent master which the Hazelwood "constitution" provided. But Mr. Lucas Sargant, himself a pupil, gives his testimony that the boys did not look back with pleasure on the system; that it made them prematurely old; that the thoughtlessness, the spring, the elation of childhood were taken from them. "The school was, in truth, a moral hotbed, which forced us into a precocious imitation of maturity." On the other hand, a very competent observer, Captain Basil Hall, as quoted in the *Edinburgh Review* for January 1825, arrived at an exactly opposite conclusion after a "most careful inspection" of the whole establishment. However one may strike the balance between these conflicting authorities, there can be no doubt whatever of the immense advantages which the self-reliance, the equal justice, the hard work, and the fair play of Hazelwood gave it over such dens of bullying, idleness, and bad practices of all kinds as English schools too often were sixty years ago.

At Tottenham, Rowland Hill worked pretty nearly as hard as he had done at Hazelwood; but the neighbourhood of the capital gave him pleasant society, and, what was more precious still, plentiful opportunities of exercising his talents for invention and organization. He had been a mechanical inventor as well as a deviser of systems from his earliest boyhood. He had made cunning electrical apparatus, and had demonstrated therewith at lectures which his father gave; he had thought of improvements in astronomical instruments, and had carried out not a few; he had devised a cylinder press for printing continuously, which was, at any rate in general principles, a forerunner of the machines upon which every important daily paper in the kingdom is now produced. In a memorandum dated just after the Reform Bill, Dr. Hill found this formidable list of mechanical devices which were then occupying his uncle's thoughts:—"Pendulous mechanism as applied to steamboats. Propelling steamboats by a screw. Improvements in Bramah's Press. Plan for checking the speed of stage-coaches. Weighing letters. Assorting letters in coach. Telegraphs by pressure of air. Gas for distant places compressed along small pipes. Road-making by machinery." It is curious that two of these should indirectly concern the subject which was destined to make him famous, though he does not seem to have as yet turned his thoughts to Post Office reform from the financial point of view. What might have seemed more visionary schemes were, however, formed by himself and his brothers, one of them being for a so-called "social community," a sort of unecclesiastical monachism, uniting co-operation, as now understood, with social life. This scheme seems to have been seriously considered by a large number of persons. All this time, however, Rowland Hill was anxious to give up school-keeping, and a chance meeting with Edward Gibbon Wakefield resulted in his being appointed Secretary to the South Australian Colonization Commission, after being connected in power for his future work. Indeed his acceptance of this colonial business must properly be regarded as the turning-point in his career. It was not, however, until 1837 that he really entered upon the campaign which was to occupy him for the remainder of his life of health and strength. At that date he was forty-two years old, and had for some five or six years had abundance of that mixture with the world at large which is frequently wanting to provincial-bred men even of the greatest natural force. He was still an ardent and convinced Liberal, though his zeal took the form rather of eagerness for practical improvements in the condition of the people than of political doctrinairism. But, as we have said, the history of his performances in reference to postal reform had better be left for another occasion.

GALLENGA'S SOUTH AMERICA.*

MR. GALLENGA tells us that a traveller to South America has choice of two routes. He can go from Europe to any one of the ports of Brazil south of Para, and when he has fairly "done" that Empire, he can go through the Straits of Magalhaens to Chili, Peru, and Ecuador, and return by Panama. Or, he may reverse this order of things, and take the West Indian islands on his way to the isthmus, and then come down the whole coast of South America in magnificent steamers, and finish his tour by visiting Buenos Ayres, Monte Video, and Rio Janeiro. The author wisely chose the latter route, and gradually exchanged the stifling, steamy, oppressive atmosphere of the tropics for the delicious and pure air of Chili and the unrivalled climate of the Pampas. It was unlikely that a writer of such experience and intelligence would not have a good deal to tell us about republican institutions, commerce, physical comforts, social and moral progress, and population. His style, though a little too redundant and overflowing at times, is animated, expressive, and clear. He has that eye for the natural features of a strange country which is always descrying resemblances to well-known places in the Old World. The largest street in Buenos Ayres "hardly comes up to the width of the Corso at Rome." The railways on the tops of the Andes eclipse the Soemmering Pass. Another panorama reminds him of the Superga at Turin; and the glaciers of Norway and Switzerland sink into utter insignificance before the masses of ice, sometimes fifteen and twenty miles in length, which amaze the traveller who threads the narrow channels of the Straits of Magalhaens, instead of, as in former days, rounding Cape Horn. Mr. Gallenga generally kept close to the beaten track, except during one or two occasions in his visit to Chili. He went wherever railways or comfortable ocean steamers tempted him, or rude mail coaches could jolt him over execrable roads. He encountered sundry discomforts, but never positive hardships. He never cut his way through the jungle like Mr. Bigg-Wither; or sailed for hundreds of miles up the tributaries of the Amazon, camping on the beach at night, like Mr. Smith. It is true that he once thought of crossing the Andes from Santiago to the Argentine Republic, in preference to taking the long sea route, and he was once sufficiently near to the Araucanian Indians to hear terrible stories of their predatory habits and to find the Chilians panic-struck at an expected foray. But, as a general rule, he seems to have been satisfied with the main lines of traffic, and his work is naturally coloured by what he saw and heard in civilized centres and outposts. We impute no blame to him when we say that on certain points his pages are a blank. Of fauna he has nothing, and of flora he has very little, to say. Inquirers who write to the papers to know how in foreign lands sport can be combined with sight-seeing or with a livelihood, need not refer to Mr. Gallenga. Once, when in Chili, he crossed torrents on alarming suspension bridges, and enjoyed such moderate sport as "the birds in the bush and the trout in the stream" could yield. Alligators, he says, can be shot, or shot at, from the deck of a steamer, as they bask on the mud of the Paraguay and Parana rivers. And young men may possibly be tempted to colonize the Argentine Republic by glowing descriptions of life in the saddle, and extensive flats either covered with lowing herds or sheltering winged and ground game in which native Indians have "concurrent rights." Neither, again, does the author afford very much information as to the security of life and property, the efficiency of the police, the administration of justice, or similar topics. Incidentally, we gather that in these important departments there is yet a good deal to be done. We should also say that the author commenced his travels with a predisposition to view recent events and probable changes with rather Liberal eyes, and that, as he proceeded on his tour, repeated stories of the venality and the recklessness of political adventurers caused him to modify his opinions. Though Chili undoubtedly owes a good deal of its quiet life to an aristocracy, its prosperity is "factitious and ephemeral," and may have to be succeeded by something more in keeping "with the stern exigencies of a democratic community"—words which, in the mouth of one so experienced, are almost as mysterious as were the sentences of Dickens's "regular Down Easter" in the *American Notes*. Then, in the Valley of the Rio

* *South America*. By A. Gallenga, Author of the "Pearl of the Antilles," "Country Life in Piedmont," &c. London: Chapman & Hall. 1880.

Chillan, not very far from San Rosendo, he gave vent to the reflection that the oaks and elms of the proudest duke in England were quite contemptible "by the side of the glorious timber of God's own Park"—a sort of phrase which strikes us as culled from the vocabulary of the "thoughtful," but excitable Radical. But a little further on it would appear as if a longer acquaintance with South American communities had disabused the author of any "unreasoning partiality to the mere name of a republic"; and when he denounces Presidential changes, "rabid politicians, and a blatant fire-and-brimstone press," we begin to feel that we have done Mr. Gallenga an injustice; that he has ceased to believe in the supremacy of riff-raff; and we heartily endorse his advice to the Brazilians to recognize the heavy debt which they owe to their sovereign for at least half a century of social order and constitutional rule.

In truth, the chapters on Peru, Ecuador, and Paraguay are powerful exposures of the madness of universal suffrage, with its series of shifting Presidents and its scrambles for power and place. It is quite certain that, whatever may be the future of South America—and Mr. Gallenga is convinced that it has a fine future—aristocratic Chili and monarchical Brazil are far ahead of the numerous republics in which good Presidents are ruthlessly murdered and unscrupulous despots rule for years by alternate corruption and force. But we shall now run down the coast with the author, sympathizing with him in the length of time it took the *Nile* steamboat to go from Southampton to Colon on the Isthmus of Panama. Twenty-one days were required to get over about 5,500 miles. Colon is a wretched nest of hideous negroes, built on a marshy island and reeking with fever. It is named after the discoverer of America and adorned by his statue, the gift of the Empress Eugénie. From this place to Panama there is a railway, forty-seven miles in length, constructed, at an outlay of two and a half millions, through a mass of tangled vegetation, which at times threatens to strangle the very line in its grasp. Panama is little better than Colon—a miserable town with a splendid site. Naturally Mr. Gallenga has something to say about the ambitious project of Sir F. Lesseps. He is inclined to think that the cost of the canal may double the present estimate of money and time, and may require eighty millions sterling and twenty years of work. The estimated difference in the tides of the Pacific and Atlantic, something like twenty-six feet, reminds us of a very clever story, the "Junction of the Oceans," in a series of sketches published under the title of *Bole Ponjis*, by the late Henry Meredith Parker. That humorous and ingenious writer imagined the successful cutting of this very canal; dwelt on the complacent verdict of the best engineers of the day on the scheme, and the demonstrable absurdity of thinking that any difference in the levels of the oceans could cause the slightest anxiety; described the expectant multitudes assembled at Panama, and the magnificent spectacle of letting in the water, in the presence of the Federation of the World, in the year 2098. But, when the last barrier had been removed in the story, the opening let in, not the peaceful waters of the Pacific, but a raging ocean, tossed up into peaks and mountains high as the Alps, to descend in a cataract, to overwhelm the universe, and to reduce mankind for the second time to Deucalion and Pyrrha. Vague apprehensions about the difference of levels may not hinder the completion of the work; but want of funds and political complications and rival schemes may prolong the date when the Suez Canal shall be eclipsed.

Leaving an unhealthy climate and a corrupt community, Mr. Gallenga went down the coast in one of the splendid steamers of the South Pacific Mail Company, and touched at Guayaquil, which he oddly describes as a thriving but shabby seaport of Ecuador. Of this republic he has little to say, except that, like most other States in the Southern hemisphere, it murders its Presidents and, till lately, sent St. Peter's pence to Rome. A longer stay in Peru enabled him to go from Callao to Lima, or, as it is still called, Los Reyes, "the city of the kings." The site is magnificent and unrivalled; but the climate, though equable and temperate, is one of the most dispiriting in the world. There is no violent tropical rain, but only a dreary Scotch mist which for six months obscures the sun. The Andes are very rarely seen, and the nights are always cold. There is nothing in the country to compensate for this bad climate. Roads are mere tracks, ankle-deep in sand. Railroads, intended to span the Andes and to reach the great tributaries of the Amazon, are at a standstill for want of money, though at some places they have been carried to heights which were thought impossible; some of the gold mines are worked out, while the silver mines are either badly managed or are now possessed by Bolivia; stores of guano, which was to have taken the place of minerals, are coming to an end; and the senseless struggle of Peru with Chili has disturbed the finances of the former State and impoverished the country. Yet the account of Mr. Gallenga's trip to the Oroya Pass, of the Montana or eastern slope of the Andes, and of the difficulties already surmounted, leads to the conclusion that the Transandean railways, if completed, would not only be splendid monuments of engineering skill, but important elements in that future of boundless wealth and restored credit in which Mr. Gallenga would have us to believe.

The author stayed rather longer in Chili, and his account, while it disparages aristocratic government, confirms all that we have ever read or heard of that country. In the first place, the atmosphere is pure and salubrious, the only drawback being the continued drought and the frequency of earthquakes. Valparaiso, or the Vale of Paradise, is remarkable for cleanliness and order. Santiago, on a noble site, has broad streets, groves and fountains, fine public edifices, wealthy private mansions, a promenade, a museum, a model farm, and everything that becomes a political capital. An Anglo-Indian might be led to think that it combines all the merits of Simla and of Calcutta. Here the landed aristocracy spend the revenues of their vast estates, monopolize public offices, and raise the prices of foreign articles, from Letts's Diaries to German dolls. Mr. Bright would be glad to know that, owing to a change in the law of succession, estates are now being divided; but the condition of the labouring population is said to be one of misery. They emigrate to Bolivia, when they cannot live on their Chilian allotments of a few acres, supplemented by wages for extra work. While Northern and Central Chili both suffer from drought, owing to Polar winds, the Southern tract has continuous rain for weeks. Here we are in the region of primæval forest and luxuriant vegetation. There are lovely islands fringing the coast; land-locked bays disclosing at every turn scenes of exquisite beauty; and thrifty German colonists, who, though looked on with some slight suspicion, settle, drink beer, establish singing clubs, and grow almost as fat as the obese Chilians. The conduct of Chili in the recent war with Peru deserves more favourable notice than it has received at the hands of Mr. Gallenga. Those who have watched the origin and progress of the campaign can scarcely doubt that the righteous cause has hitherto triumphed. Whether success in war will be a source of ruin or of prosperity, whether the acquisition of nitrate and guano will corrupt the sober-minded and industrious population of Chili, are questions which may admit of controversy. But it is certain that hitherto Chili stands first among the republican States of South America for public credit and political capacity. It is not specially favoured by nature. One of its chief wants, water, no amount of development will ever supply. Its population is little more than two millions, and the want of any fertile land on the eastern slope of the Andes is scarcely compensated by some sixty harbours on its long narrow strip of coast. The revenue is about three millions and a quarter, and the public debt is not much more than three times the revenue. The mineral produce is equal to the agricultural wealth. If there is any one State which may look forward to its "future," it is this narrow, thirsty, aristocratic State, and to this conclusion all Mr. Gallenga's facts and arguments really point, in spite of his adverse opinions.

As a contrast let us just look at the picture drawn of Paraguay by this experienced writer, who talks, as we have said, about the "stern exigencies of a democratic community." Though on the borders of the tropics, it lies between two large and fertilizing rivers, the Paraguay and the Parana, the former of which is navigable throughout the whole length of this republic, and, indeed, up into the very heart of Brazil. The soil is fitted for the cultivation of tea, coffee, tobacco, and sugar. The number of its cattle might easily be doubled or trebled; and stock and meat could be exported to a large extent. Three-fourths of the land belong to the State. The want of a seaboard is half compensated by those two navigable rivers, and railways would easily open a communication with Brazil. Yet the whole revenue is only 121,000*l.*, or about the average of a single district under the Perpetual Settlement of Bengal. The expenditure, it is almost needless to add, exceeds the revenue, and there is a public debt of a million and a half. Its history, since 1811, is made up of struggles for power, imprisonments, confiscations, proscriptions, a wicked war with Brazil and the republics of the Plate, and the rule of a ferocious despot, Lopez II., who took advantage of a popular form of government first to master and then to ruin his country. Asuncion, the capital, is like a city of the dead, with wildernesses for its squares and streets; it is almost a misnomer to talk of the labouring population, where every one is incorrigibly indolent and vicious; the priests openly outrage morality, and cock-fighting, racing, and card-playing form the serious business of life. Paraguay might be a compact and model Republic. It now merely represents a good-sized tract in South America covering nearly sixty thousand square miles, without the rudiments of civil Government at home or the slightest credit abroad.

Uruguay is a State with a fine capital and fair prospects; but, in point of size and capacity for development, the Argentine Republic is probably at the head of the list of similar South American States. It is true that Buenos Ayres as a port is surpassed by Monte Video; but the extent of country open to emigrants and settlers in the Plate is enormous. As Mr. Gallenga pointedly observes, the question is not whether abundance of land can be had at a moderate price, but whether a residence any where in the neighbourhood of Cordova or Rosario is not burdened with conditions to which few Englishmen would submit. The climate is salubrious, regular, and enjoyable; life in an *estancia* enables a proprietor to be in the saddle half the day; and the isolation is not more than is experienced by many a tea-planter in Assam or Cachar. But we confess to some doubt about the development of agriculture when we read of long flats covered with stunted brushwood and saline efflorescence; want of water; a horrible grass, termed the Flechilla, which works its way into the clothes of men, the wool of the living sheep, and the joints of mutton; plagues of locusts; and alternate exposure to plunder by marauding Indians and Gauchos, and to requisitions for valuable cattle and favourite horses by the virtuous partisans of rival candidates for place. Doubtless the account of a visit to a comfortable country house not a hundred miles from Buenos Ayres, or to a *saladero* where cattle are

slaughtered, skinned, and salted for exportation with more than the celerity of Chicago, sounds attractive. But it is surely ironical in Mr. Gallenga to say that a young man with 10,000*l.* or 20,000*l.* of his own, "might do worse than settle on the broad lands of the Plate." Those who command this capital will employ or invest it elsewhere. What is wanted is that the Argentine rulers should make life and property as safe as laws and Governments can make them, and give fair scope for the energies of younger sons with healthy constitutions, good education, and some fifteen hundred or two thousand pounds.

We have so recently noticed Mr. Smith's excellent work on Brazil that we must pass over Mr. Gallenga's chapter on this vast Empire. If any State in South America can look to the future, it is surely a country which has a revenue of fourteen millions slightly in excess of its expenditure, splendid rivers, several fine seaports, and every kind of tropical produce. Here, as elsewhere, the question of labour will be a crucial test when slavery comes to an end a few years hence. This example of a successful trip may possibly induce those who now multiply knowledge and run to and fro on the earth, to visit South America, and form a judgment for themselves on the multitude of topics started and discussed in this volume; but it must not be hastily assumed that every traveller with an eye for scenery and an ear and pen for statistics will be able to turn out as instructive, agreeable, and interesting a volume.

BLACKIE'S *FAUST.**

In a general way we are of opinion that there are too many translations of *Faust* in the world already. Not that among these good ones are wanting; but, on the contrary, two or three are so good that there seems to be no reasonable prospect of improving on them. One, Bayard Taylor's, is more than good; it is a masterpiece in its way, and it would hardly be rash, considering the difficulties of the undertaking and the completeness of the performance, to call it the best verse translation in the English language. It shares with Miss Swanwick's version, and one or two others at most, the honour of having gone through with the Second Part of *Faust* as well as the First. Of Miss Swanwick's work we had occasion to speak not quite two years ago. Along with Mr. Kegan Paul's translation (which, however, is of the First Part only) it may take a place as near Bayard Taylor's as any. Close on these comes Sir Theodore Martin's, which, if it does not everywhere attain the modern standard of exactness, has great occasional felicities. Anster's work must be named because it is familiar; but nowadays we can hardly count it as a translation at all. Besides these we have the multitude, too many to be remembered by name; some of them, no doubt, meritorious enough to have won distinction if their authors had chosen to ride in less crowded lists. In this state of things we confess that we look but coldly on fresh additions to the number.

But Professor Blackie is not a new adventurer. He came into the field as much as forty years ago, before translations of *Faust* were abundant, and when the German language and literature were still comparatively unknown among us. He has now revised and in some measure recast his work, encouraged, he tells us, by approval of it in its earlier form received from both English and German scholars at various times. To dispute its right to exist under such circumstances would be pedantic; and, being there, it can afford to stand well enough on its own merits. The earlier edition we do not know. As Professor Blackie's translation now stands, it is a vigorous, careful, and faithful piece of work. It is chiefly wanting, we should say, in subtlety and finish. It has a kind of bustling air in which the full and delicate harmonies of Goethe too often disappear. After all, this defect is in some measure unavoidably incident to the nature of the work. Every translation of poetry, save in the few cases of wonderful success, must have to a reader who knows the original something of the effect of hearing a song through a telephone. And Professor Blackie has certainly not fallen behind the average success of good translators in the extent to which he reproduces the effects of his original. But in this case the standard of criticism is exceptionally severe; for we cannot help comparing Professor Blackie with a translator who, as we have said, is more than good.

In his preliminary essay Professor Blackie considers the question of Dr. Faust's historical existence. One or two modern scholars have sought to resolve him, like other personages of fabulous reputation, into a mere myth. But there is quite sufficient and credible evidence that in the early part of the sixteenth century one John Faust was travelling about Germany, "making his name known to everybody, and making great show of his skill, not in medicine only, but in chiromancy, necromancy, physiognomy, visions in crystals, and such like," as a contemporary describes him. From another account we learn that at the time of his death he was supposed to have been slain by the devil, and that besides his undoubted magical arts he "was also a great boaster, and pretended that all the victories of the Imperial armies in Italy were gained by the help of his magic." Here we have already some of the elements of the Faust legend which was not slow to grow up; and it is not immaterial to remark that these accounts are the more worthy of credit as coming from persons to whom the legend in its later form was evidently unknown. There is no difficulty whatever in supposing a real person to become the centre of a supernatural legend or group of legends within a moderate time of his death, or even before it, if he chooses to excite, instead of rebuking, credulity. Such cases are less uncommon in history than is generally supposed; and such things have happened in the East even within living memory. Bayard Taylor sets forth the same evidence as Professor Blackie, or rather more, and comes to the same conclusion. The only question remaining unsettled is whether more than one real Faust may not have been involved in the legend. It seems possible that when John Faust's vogue was at its height, the name was of set purpose assumed by travelling charlatans. All this would be so much additional facility for the formation of wild and confused stories.

Professor Blackie goes on to add to his introduction an account of the Second Part of Goethe's *Faust*, which "somewhat detailed panoramic view of that remarkable production" he states to be for the benefit of such as have not read and are not likely to read it. But for this declaration, we should have supposed some intention of apology for not translating it—we mean apology in its older sense, as an explanatory justification. Professor Blackie makes it evident that for himself such a task would have been much against the grain, and the tendency of his remarks is to suggest that it is not worth doing by anybody. He has read the Second Part of *Faust* manfully through, but it was mostly pain and grief to him. He treats the whole thing as a "magnificent failure," and lets us perceive, indeed, that he thinks it much more a failure than magnificent. "There may be some few great things, and some wonderful things, and not a few wise things (as who could expect otherwise from Goethe) in the Second Part of *Faust*; but it is certainly neither a great drama nor the just sequence of a great drama." Over the episode of Helena Professor Blackie almost loses his temper. Euphorion is altogether too much for him. "Of such a strange jumble we may say truly, as Jeffrey said falsely of Wordsworth's 'Excursion,' *This will never do.*" Confidence is one of Professor Blackie's particular and, one may say, favourite qualities; and far be it from us to disparage it in a generation when people are apt to think twice and thrice of possible criticism for once of the thing they have got to say. But this is going rather far in the face of Mr. Carlyle's judgment. Fifty years ago or more, when *Helena* made its appearance as a detached instalment of the second part of *Faust*, Mr. Carlyle said of it by no means "This will never do," but something very different, which may now be read in his collected essays. To Mr. Carlyle rather than to Professor Blackie we must direct those who would be put on the road to rightly enjoying one of the most curious and splendid productions of Goethe's imagination. Fortified by Mr. Carlyle's authority, we may here briefly say that what to Professor Blackie appears a "strange jumble" appears to us to sum up with a power unrivalled in modern poetry the ideals of Greek art and their influence on the modern mind, as the wonderful last scene in heaven—to which Schumann's music is the only fitting commentary—presents in quite another way the best side of mediæval and Catholic exaltation. But the *Mater gloriosa* fares yet worse at Professor Blackie's hands than Helen. Will it be believed that the closing words—

> Das Unbeschreibliche,
> Hier ist es gethan;
> Das Ewig-Weibliche
> Zieht uns hinan—

are presented by him to the English reader thus?—

> Beauty immortal
> The rapt spirit hails,
> Where the eternally-
> Female prevails.

Of course translation is baffled here; but only total want of sympathy could enable a scholar of Professor Blackie's ability to turn out such a caricature, even by way of incidental illustration. Bayard Taylor's—

> The Indescribable,
> Here it is done;
> The Woman-Soul leadeth us
> Upward and on!—

is at least in the right direction towards the movement and spirit of the original. And it is just the finer spirit and movement that, even where he is in sympathy with his author, Professor Blackie does not always preserve.

But we have one word yet to say of the Second Part of *Faust* in general. Before we complain of it for not being dramatic in the ordinary sense we must be satisfied of our right to expect it to be dramatic. No such right can be discovered in the conditions or the professions of Goethe's work. If we conceive him as starting with the general intention of building up a great poem in dramatic form on the lines of the Faust legend, two things are at once plain. The first is that, as a matter of fact, there is much more of the legend in the Second Part than in the First. The Emperor's court, the phantom of Helen (converted by Goethe to uses all his own), Faust's coming to aid the Emperor by magic—all these belong to the old story. The next point is that a work following these lines could not in the nature of things have a continuous interest of the properly dramatic kind. It is a strange involuntary tribute to Goethe's power that to most readers the whole of *Faust*

* *Faust: a Tragedy.* By Goethe. Translated into English Verse, with Notes and Preliminary Remarks, by John Stuart Blackie, Professor of Greek in the University of Edinburgh. Second Edition, carefully revised and largely re-written. London: Macmillan & Co. 1880.

is just that part which Goethe put into it without reference to the legend—namely, the episode of Gretchen. On the popular view of *Faust*, which is faithfully enough embodied in Gounod's opera, not only the Second Part, but the First, is inexplicable. For there is a great deal in the First Part which is quite irrelevant to the action, considered from this point of view; nay, in the Walpurgis Night there is full as much extravagance in the way of jests and allusions of transitory and even merely personal interest as anywhere in the Second Part. If the Second Part as a whole, and the close in heaven, are a failure, we see no escape from the conclusion that the Prologue in Heaven is a "magnificent failure" too. To put it shortly, *Faust* contains, among other things, a drama of powerful human interest; how powerful perhaps only those know who have had the good fortune to see it on the German stage. But that is surely no reason why it should not contain and be a great deal more. And, therefore, we feel that in his introduction Professor Blackie strikes a wrong note, and, so far as in him lies, misleads the English reader as to the significance of the First Part, which alone is to be presented to him in an English dress.

We have not offered to criticize Professor Blackie's translation in detail, and such a process cannot indeed be satisfactory unless performed on a scale that would exhaust both critic's and reader's patience. The reader will perhaps prefer to take our word for it that the work is solid and honest work. We have not disguised our opinion that better has been done; but this is good notwithstanding. As a fair specimen, we give in part Faust's soliloquy in the third scene of the fourth act:—

> Spirit Supreme! thou gav'st me—gav'st me all,
> For which I asked thee. Not in vain hast thou
> Turned toward me thy countenance in fire.
> Thou gavest me wide Nature for my kingdom,
> And power to feel it, to enjoy it. Not
> Cold gaze of wonder gav'st thou me alone,
> But even into her bosom's depth to look,
> As it might be the bosom of a friend.
> The grand array of living things thou mad'st
> To pass before me, mad'st me know my brothers
> In silent bush, in water, and in air.
> And when the straining storm loud roars, and raves
> Through the dark forest, and the giant pine,
> Root-wrenched, tears all the neighbouring branches down
> And neighbouring stems, and strews the ground with wreck,
> And to their fall the hollow mountain thunders;
> Then dost thou guide me to the cave, where safe
> I learn to know myself, and from my breast
> Deep and mysterious wonders are unfolded.
> Then mounts the pure white moon before mine eye
> With mellow ray, and in her softening light,
> From rocky wall, from humid brake, upfloat
> The silvery shapes of times by-gone, and soothe
> The painful pleasure of deep-brooding thought.

THE LEADEN CASKET.*

It is Mrs. Hunt's misfortune that the title she has chosen for her novel will alienate that large class of readers to whom "not to know the end" of a book is the only inducement to read the beginning. If Mrs. Hunt had followed the example of some of her contemporaries, and called it "Only a Girl," or "He was but a Landscape Painter," or something of that kind, the reader would have been left in peace to conjecture which of the three eligible gentlemen and two charming young ladies ultimately become united, and which of them prefer to die of consumption in foreign parts. But, with the *Merchant of Venice* fresh in the minds of us all, the dullest and most ignorant cannot help knowing that he has only to lay his finger on the poorest and humblest person in the book, and behold! he has discovered the leaden casket—the successful wooer. And yet, in spite of the foregone conclusion, we doubt if the most ingenious will be able to guess the plot of the story; for, notwithstanding appearances, there is a plot. Those who do not care about guessing, and are content to take and enjoy the events as they come, will find ample repayment.

Olive Brooke, the heroine, is a little girl whose father and stepmother are in India, and who is in consequence living with her uncle and aunt, in Harley Street. By casual references in the book we find that Dr. and Mrs. Brooke had five children, but as they never make their appearance, the reader is apt to forget them, as their parents seem to have done, and, as far as we are concerned with her, Olive was the only child of the house. She was left pretty much at her own disposal, for her uncle was away all day, and her aunt, whose intentions were excellent, was too much engaged in novel-writing to be able to put them into practice. We fell in love with Olive from the moment she confessed her inability to do sums—"They seem as if they cracked me all over somehow"—and she retains her hold till the very end of the book. Left alone as she was, her reading was somewhat miscellaneous, and included more novels than are usually contained in the libraries of young ladies of her years. To remove her from these studies, she is sent for a while to her grandfather at Austerfield, in Yorkshire, where she meets little Willie Morrison, son of a London clerk, and nephew of the village butcher, in whom the polite reader will at once recognize with a shudder the Leaden Casket. The infant idyl of Olive and Willie is charmingly told. Olive at once falls desperately in love with her playmate, not unconsciously, as would be the case with most children, but from a feeling, born of her novel-reading, that it was the proper thing to do. The author has here undertaken a very difficult task, but she has managed it most delicately; and, instead of being disgusted with the precocity of the child, we are only amused and interested. Before they part, she sketches out the speech with which, in years to come, the boy is to demand her hand from her uncle:—

> "And when they say to you, as I am afraid they will some day, Willie—for you see, unfortunately, my relations are of a superior rank to yours—'We cannot suffer our daughter to make this misalliance—your station, young sir, is an insuperable bar to any union with our house,' you are to lay your hand on your heart, and flash defiance with your lustrous brown eyes, and say, 'Measure not my rank by my birth, but have regard to my achievements.'"
>
> "I say, Olive! But you are going it! Achievements! What do you mean?"
>
> "Nay, that's what they say in all the books that I read; and, besides, you must have some achievements—do something very grand and distinguished, I mean; you must be a soldier, or a sailor, or win a battle all by yourself, or write a book that the whole world will go mad about. I don't want to fix exactly what you are to do, Willie; but you must do something."

This passage is the keynote to the whole story. When next we meet Willie he has studied painting abroad, and is already showing great promise as an artist. He has never forgotten the days he passed with Olive, who opened a new world of literature and poetry to him, of which he then took very little heed, but which now he is beginning to value. Olive meanwhile has grown up into a beautiful girl, to whom her childhood is a very living memory, and books as dear as ever. It suddenly dawns on her aunts that she is grown up, and that it would be as well to take her into society. These aunts are all very well drawn, and very different. There is the fashionable, fast, and unscrupulous Aunt Raymond, the novel-writing Aunt Selina, and the stingy and morose Aunt Ullathorne, whose chief pastime and extravagance consists in buying pieces of ground in spots that she thinks eligible for her interment. A rather doubtful adventure into which Olive has been dragged by Aunt Raymond opens Dr. Brooke's eyes, and he at once tells his wife that she must go into society, and take Olive with her. After having led the life of a novel-writing eremite for so many years, it is a little surprising that Mrs. Brooke should continue to have "numbers of invitations" for dinners and evening parties; but, however this may be, she picked and chose those which would afford her literary, artistic, and musical society. Then follows a most delightful description of a party given by two young poets, "at which no one was allowed to be present who was not either already distinguished or certain to be so. There were poets and novelists and artists and musicians, and ladies who looked as if they had walked out of pictures (of a certain school, be it well understood). The room was provided with divans, to which each lady was led as she entered; and when she was seated, a heavy-headed flower was placed in her hand, which she graciously held. Heavy-headed, too, were the fair ladies who thus came in with hair frizzed and rolled, and twisted and filletted with gold or silver, or parti-coloured bands under which a few flowers were naïvely stuck, in frank confidence in their own powers of either arranging themselves or lending themselves to adornment without any arrangement. Most of these fair guests were clad in soft white, or faint blue, or amber dresses, freakishly made; tight where other people would have had them loose, and loose where it might have seemed more convenient to have had them tight." Brilliant indeed must have been the scene, and when the water-lilies, which were the "first course," as it were, faded, they were cast on the floor, and were succeeded by tulips, carnations, and roses, in their turn to die and be trodden underfoot.

As might be expected, Mrs. Brooke's whole nature was touched by these wonders, and with the promptitude of a truly great mind she at once began to transform her household, including herself and Olive. The description is amusing, but is too long to quote, and we must refer the reader to the original. Into this world entered Lady Brooke, Olive's stepmother, a woman of conventional ideas and utter indifference to the claims of others. With her usual insincerity she tried to flatter her sister-in-law into believing that she was most interested in her novels, and paid the penalty in having to undergo many hours of MSS. reading, and an evening at the "Millennium," in which we recognize without difficulty the soirées of a peculiar club. Here, however, she has unexpected luck in meeting with the Golden Casket in the person of the worthy, stupid Sir John Ellerton, who has fallen desperately in love with Olive. The next volume is occupied with the progress of this love affair. Olive, taken away from her uncle and aunt, turned loose into the fashionable world, imposed on and cajoled by Lady Brooke, at last consents to accompany her mother to Scotland, on a visit to Sir John and his mother. The result is that, after some weeks, she is talked into accepting him, though the very next day she is overcome with remorse, and entreats him to set her free.

It is in this Scotch visit that we become intimate with Mr. Ardrossan, the sketch of whose character is a masterpiece. It is rare, indeed, either in real life or in fiction to meet with a man who, to quote the words of a modern novelist, makes all others appear like half-ripened plums, which are only good on the side that has had a glimpse of the sun. Of course we know that he is the Silver Casket, and resent bitterly what is in store for him, as well as the cool way in which Mrs. Brooke sums him up, as "pale, refined, learned, but already falling into the ranks of

* *The Leaden Casket.* By Mrs. Alfred Hunt, Author of "Thornicroft's Model," &c. 3 vols. London: Chatto & Windus.

veterans." He was only forty-five, and any woman might have been thankful to marry him. With Olive he promptly falls in love; but of this she is quite unconscious, and only regards him as a friend. She sees a good deal of him in Scotland, but of course, after her confession to Sir John, she has to leave at once with her mother. They have a terrible journey, during the first part of which Lady Brooke, in order to force her into the marriage, tells her that she is only her stepmother, that Olive's own mother disgraced herself and was divorced, and that she herself has come to England for the sole purpose of getting Olive off her father's hands. While Olive is still writhing with agony from this announcement, the train comes to a standstill in a snowdrift. Scotch trains generally do stop in snowdrifts; but we have never before known one do so in a novel. We are truly grateful to Mrs. Hunt for having introduced a new incident into fiction, and for the admirable way in which she has managed it. It is here that Willie Morrison and Olive meet again and fall into conversation. She soon recognizes him, but is too shy to introduce herself, especially as he only knows her by repute as a fashionable beauty, and says some hard things on the contrast between the woman of the present and the child of the past. A little later in London he meets Mr. Ardrossan at the house of Mr. Ambergreen, an eccentric artist, and is allowed to go and make his apologies to Olive in person. She is, however, far too miserable in thinking over what she has lately heard, and in trying to circumvent Lady Brooke, who is still bent on the marriage with Sir John, to be very encouraging to Willie. He shortly afterwards goes to St. Hilda or Whitby, and here makes acquaintance with Miss Rosamond Keithley, to whom he becomes engaged after his first rejection by Olive. This episode seems a little unnecessary and inadequate, and so does the explanation given to Olive as to the innocence of her mother, who is at last discovered on her death-bed; but the author has given us so very little to find fault with that we must make the most of any weakness. The scene in which Lady Brooke tries to explain away her conduct to Olive is very powerful, and the meeting with Willie at the Water Colour private view, when the misunderstandings are cleared away, is charmingly told. Olive is standing there dressed in dusky red (would she not have been in mourning for her mother?) when Mr. Ardrossan appears, and knowing that his own case is hopeless, gives her some good news about Morrison's pictures which she is to report to the artist himself. She is very proud and pleased, and in her annoyance at the calm way in which Morrison takes it, tells him that "it is quite an achievement." Then she remembers, and tries to recover herself, but the mischief is done.

How every one is made happy without behaving badly to anyone else shall be left to the imagination of the reader. For ourselves, the characters have become our friends, and we take leave of their history with regret. It will always be the greatest of pleasures to meet Mr. Ardrossan. Kensington Square will have a new attraction as being the residence of Aunt Ullathorne, and we shall never again walk through Kensington without wondering which is the highly-favoured house that contains Mr. Ambergreen. Mrs. Hunt may perhaps write another novel as good as this, but we doubt if she will ever do better.

GORDON ON ELECTRICITY AND MAGNETISM.*

WE may safely say that at the present time the subject of electricity and magnetism occupies the attention of physicists more than any other branch of study. Heat, light, and sound are each provided with a clear physical theory which explains all that is known and serves as a guide to other discoveries; but it is not too much to say that as yet electricity is quite without any such theory. The ingenious hypotheses from time to time propounded by mathematical physicists are beautiful and interesting from a mathematical point of view, and some one of them may perhaps be the true explanation of the phenomena; but the instinct of physicists leads them to regard these hypotheses with distrust, and to look for some simpler theory, and one which can be grasped by the mind without the aid of the mechanical mode of thought used by mathematicians. Of course the mathematical method must be used in all higher investigations; but the basis, or starting-point, for mathematical calculations on physical subjects is usually so simple that its outlines may be easily grasped by any one, however ignorant of mathematics. All astronomy is based on one or two laws so simple that a child can remember them; and the conception of ether and vibrations of different periods across the line of transmission, which is the foundation of the undulatory theory of light and heat, is of the utmost simplicity; and so, again, is the physical basis of the theory of sound. None of this clearness can be found in any theory as yet put forward for electricity; so that even down to the present time electricians are obliged to use the old "two-fluid" theory as a *memoria technica* by which to hold their knowledge together, although it has long been discarded as a trustworthy theory of the phenomena. We have learned to tolerate the conception of ether, and modern research tends rather to increase than diminish the probability of its actual physical existence; yet the mind recoils from the hypothesis of two fluids which are each perfectly elastic and unaffected by gravitation, and, further, which destroy each other when equal volumes meet.

Perhaps we ought not to hope that the true theory of electricity can approach the simplicity of heat, light, and sound, for in the case of electricity we require an hypothesis to explain and connect certainly one mode of motion, and perhaps two or three, and one or more states of strain; and, further, we have already reason to believe that we have to deal with motions and strains of both matter and ether. As yet we only know that we can measure the motion of a current and the strain of charge, or of a magnetic field in certain units, and that they have exact equivalents in other forms of energy; but the instant that energy, whether in the form of heat, mechanical motion, or chemical affinity, is transformed into electricity of any form, we lose sight of the machinery, and may even be said to lose sight of the energy itself, until it be reproduced in some better understood form.

The enormous practical development of electricity which has been seen in the last few years has not been without its influence on scientific investigation, and we shall probably owe as much to the telegraph in its various forms and to the electric light in the clearing up of the problem of the physical nature of electricity as we now owe to the steam-engine in the investigation of the mechanical equivalent of heat which forms the foundation-stone of those stupendous and fruitful modern generalizations, the conservation and dissipation of energy. But at present all that can be done is to watch every electrical phenomenon closely, varying the conditions as widely as possible, and noting every result, however insignificant it may seem. This is being patiently and actively done by a vast body of able experimenters all over the civilized world, and their results appear from time to time in the form of books, but more often as contributions to scientific journals and the Transactions of different learned bodies—a form in which they are not easily accessible to scientific men who are not actually engaged in research. It is, of course, of the utmost importance that all workers should know what is being done by others, and that students should have the means of informing themselves of the actual state of knowledge on the subject; but hitherto this information could only be obtained by the constant study of many periodicals and constant intercourse with the scientific world. Mr. Gordon's valuable book comes now to serve as a guide both to the student and to those men of science who have not leisure to keep themselves posted up in the more modern work in this branch of physics. The book is carried down almost to the day of publication, and hardly any point of importance has been omitted. Each branch is discussed and explained in the text, and in many cases abstracts of original papers are given, including those of the author on specific and inductive capacity, which have won him his high place among physicists. But the great value of the book will be found in the full references given in footnotes to other works, and, above all, to periodicals, so that it serves as a *catalogue raisonné* to the literature of electricity, at all events up to the beginning of this year.

A great deal of space has been devoted to the modern observations on the discharge *in vacuo*, and excellent abstracts are given of papers by Mr. Warren De la Rue, Mr. Crookes, and Messrs. Spottiswoode and Moulton. At present many physicists seem to look upon this form of discharge as one of the weak places in the barrier of mystery which surrounds electricity, so that the space given to its consideration cannot be regarded as thrown away; though perhaps, as these observations are so fresh in the minds of physicists, the author would have been better advised had he treated of them at less length, and devoted a little more space to the discussion of some other branches of the subject. This leads us to the consideration of one great fault of the book: many points of deep scientific interest are passed over with the very slightest information; the whole theory of batteries and electro-chemistry, for instance, is dismissed in the shortest possible space, and no information is given as to modern investigations in this part of the subject. As all practical electricians are in want of a cheap battery of good electro-motive force and low internal resistance, which shall give a constant current on a circuit of low resistance, much must have been done by experimentalists to provide for this want. But Mr. Gordon gives no reference to any papers on the subject, and only mentions one book of importance. Again, although this is a treatise on the science of electricity, and not on its practical application, and we may therefore excuse the author for not describing telegraph instruments, yet we think that many of the methods of testing used in practical work are of sufficient scientific interest to be worth mention and explanation, and that, without departing from the physical and non-mathematical character of the book, the whole subject of complicated branch circuits would have been made clearer had Kirchhoff's laws been enunciated, which require no more mathematical knowledge for their comprehension and application than Ohm's law, from which they are really derived. The task of finding faults in so valuable a book is not pleasant, so we hasten to make all our objections at once, and pass on to a curious example of the way in which Mr. Gordon's desire for absolute accuracy and his occasional want of power to express himself lead him into great confusion. In his first page he gives a definition of an electrified body, and says that, if certain properties are exhibited by a body, it is said to be electrified, and he adds, in a foot-note, "not being iron or steel." Now, if iron or steel be electrified, they do exhibit these properties, and magnets do not; so that Mr. Gordon, in his desire to mark the difference between magnetism and the properties of electrified bodies, appears to say

* *A Physical Treatise on Electricity and Magnetism.* By J. E. H. Gordon, B.A. Cambridge, Assistant Secretary of the British Association. London: Sampson Low & Co. 1880

that iron and steel when electrified behave in a different manner from other substances, and to imply that magnets exhibit properties which they do not really possess. The author, in describing M. Planté's experiments, has also fallen into the common error of translating *fil métallique* by "metallic thread," instead of wire.

Were this a book of only ordinary merit and average usefulness, these faults would be not worth remarking on; but, as it is one of great research and of almost priceless value to all who are interested in the scientific aspect of electricity, they force themselves on our notice. The author, indeed, has only his own merits to blame for any adverse criticisms which we have felt called upon to bestow on his work. There is only one greater service which he could render to busy scientific men, and that is to publish a fresh edition of the book every year, with all the year's work added to the original matter. The only objection to this plan being carried out (except the certainty of illness and early death for the author and ruin for the publisher) is that in a very few years the book would be somewhat larger than the *Post Office Directory*. It is evident from the arrangement of the work that Mr. Gordon has suffered in early years from the "unhandiness" (there is no other word to describe the quality) of the older scientific text-books, in which the authors seemed to take a malicious pleasure in strewing the paths of their readers with mechanical pitfalls, figures a page or two distant from the text which refers to them, plates at the end of the book, incorrect lettering of diagrams—and numerous other devices freely used by the older scientific writers to worry and fatigue the student. But in Mr. Gordon's work all is made smooth. The plates are in the body of the book, and can be referred to without needless turning over of leaves; and, above all, the *Errata* are printed on separate slips, and bound up with the pages to which they refer. The plates themselves deserve notice, as they are quite the best drawn and the clearest illustrations which have been published in any English physical text-book. Unfortunately our English draughtsmen are not very successful in this class of work, so that the highest praise we can bestow on these plates is that they contrast favourably with those in French scientific books. Although we should hesitate to recommend this work as an elementary text-book for students, on account of the small blemishes we have pointed out, which would be very embarrassing to those as yet unacquainted with the subject, yet we can unhesitatingly say that all advanced students, and all electricians, will find it of the greatest value, and that any one who possesses a copy of this work and the Catalogue of the Roland's Library will be, in physical language, in a "position of advantage" for all purposes of book-work research.

OLD FRENCH PLATE.*

MR. CRIPPS calls his work "a Handbook for the Collector." It is well understood that a "collector," in this sense of the word, is a person who prefers catalogues to all other kinds of literature; museum and gallery catalogues for serious study, and sale catalogues for light reading and the romantic food of day-dreams. To this class Mr. Cripps appeals in the thin volume before us. In his former book on Old English Plate the mission of the collector was not made so prominent. There was, as we pointed out at the time, a considerable amount of reading provided for the general public. In this, the supplementary volume, Mr. Cripps has stuck so closely to his text that even a thorough-paced catalogue-reader will pause at the beginning, deterred from proceeding by the *chevaux de frise* with which, in a preliminary chapter on the standards of gold and silver in France, Mr. Cripps has guarded his outworks. Nor does the book become much livelier as we go on. We make our way through many paragraphs which give us such important, but dry, information as this—that "in 1554 the standard was raised to 22 carats, with a remedy of a quarter of a carat or eight grains"; or this—that "from 1578, 22-carat gold, or, given in millièmes, gold of millesimal fineness ·916·66, has been the English standard for plate, and from 12 Charles II. for coin also." No doubt these and other facts of the same kind are very valuable; and, if collecting is in the future to be elevated from a mere pursuit into a science, Mr. Cripps will be looked upon as a man who was in advance of his age. Meanwhile, however, it may be doubted whether many collectors will be able, without a yawn, to wade through the array of decimals and fractions, of carats and millièmes, here marshalled. To authors who have quantities of dry facts to lay before the public an occasional perusal of the *Loves of the Triangles* might be recommended as a lesson in the art of putting things. French standards, handled by a master, might possibly have been made interesting, and might certainly have been made readable; but the only thing we can quote from the first chapter is an extract from the inventory of the goods of King Charles V., by which it appears that "sterling" silver is not an exclusively English term; it describes "un hanap d'or, plain, à couvercle, de la façon d'un calice, et a un fruitelet d'une roze, pesant ij marcs vi onces v esterlins." Mr. Cripps might well have added a translation of this and other old French notes. Few of his quotations are so easy as this. It will require some knowledge, not only of ancient French, but also of technical terms of art, to make out the meaning of the following:—"Il est à Paris orfèvres qui veut et qui faire le set pour qu'il oevre ad us et as coustumes du mestier qui tex sunt." This is very old French, and, moreover, very bad old French; and it surely behoved the writer even of a scientific book to offer the ordinary "collector," if not the ordinary reader, some kind of clue to the explication of such phrases as "set," "ad us," and "qui tex sunt." Nor is it always quite easy to make out Mr. Cripps's own English. This example relates to the effects of the regulations of the goldsmiths' guild:—"Hampered, as they must have been all this time, by the stringent regulations of a sumptuary kind which were prompted by the necessities of Philippe le Bel, and are said by Lacroix not only to have diminished the size of the articles they were allowed to make," &c. If this means anything, it is that "the regulations of a sumptuary kind", were allowed to make articles in the precious metals; if this is not Mr. Cripps's meaning, he has changed his nominative somewhere, feeling possibly that it might be tired before it reached the end of so long a sentence. There are too many such sentences. In a work of such care and accuracy of detail it would surely have been worth while to spend a little time on literary embellishment.

As it is, Mr. Cripps has written, perhaps we should say compiled, a book on which the lazy crowd of literary pirates who never do original work for themselves will pounce with avidity. They will write out and full stop his English sentences. They will translate his old French. They will use all his facts, taking care to acknowledge a few here and there when a doubt may be thrown on their authenticity; and Mr. Cripps can only blame himself, though he may perhaps, if his benevolence is equal to his industry, derive some consolation from the thought that, without the dry bones of himself and other investigators like him, a certain number of his fellow literary men would not have wherewithal to make their bread. The tables of old Paris date letters and the facsimiles of the marks of the Farmers General are now first published, having been compiled by the author for his own use. The destruction of French records in revolutionary times, and that strange love of obliterating historical evidences which every now and then sweeps like a wind over the country, have made the materials from which these lists were gathered extremely rare. On the other hand, many of these old French works are very beautiful, and a worthy addition to the most exclusive collections. The oldest piece here noticed is a bowl or deep plate with a pattern of beaten work. It has the fleur-de-lis in a lozenge which is the mark of Paris, and was found with a coin of 1330, thus giving it an approximate date. It is now at South Kensington. The oldest piece described as bearing a date letter is a beaker or cup which belongs to Oriel College. It is diapered with chains of SS and the letter E crowned; and though it is called the Founder's Cup, it really must have been the property of Prince Edward, the unfortunate son of Henry VI. The date letter answers to 1462–3, and, as Mr. Cripps observes, the Queen, Margaret of Anjou, was in France in 1462 seeking the aid of the French King after Towton. From that date the letters are continuous, but do not differ in alphabets, like the English letters, being confined to capitals, crowned. From 1784 the letter P alone was used, the last two figures of the date being placed beside it. This new system only lasted till the Revolution. The maker's mark was probably in use long before it was prescribed by statute. It was perhaps in 1493 that the two small points or dots which are commonly observed in the maker's mark came into use. From 1672 the Farmers General marked plate, and their marks, which varied considerably from time to time, are of importance as fixing a date. As an example of what may be called "the Turkish system" of taxation which prevailed for the benefit of the French nobles, we may cite the existence of a special *poinçon de décharge* for objects marked gratis. It was put on articles belonging to or made for such royal, official, and noble personages as were exempt.

The mediæval period seems to Mr. Cripps the most interesting, and he gives us many extracts from the early regulations of the craft. But a later ordinance, made in 1612, is the only one which might with advantage be imitated at the present day. It required "the goldsmith to sell the metal of their (*sic*) works separately," distinguishing, that is, in the bills what was to be paid for mere gold or silver, and what for the art of the workman. Such a rule, or one on such a principle, with the grammar corrected, might have a reviving effect on the dying art of the silversmith in England. A good many people advocate the abolition of marks, and would carry out various other reforms; but a regulation like this, which would, so to speak, individualize art and art workmanship, might, by establishing a value for good design and execution as well as for mere metal, raise up a spirit of competition among artificers and of criticism among buyers, both of which are at present sadly wanting. We have, it is probable, good artists in the precious metals, but we do not give them much encouragement at present; and, what is worse, our great silver trade is said to be leaving us. The troublesome restrictions we put upon workmanship, and the various ceremonies through which an artist who had produced a fine piece would have to go before he could sell it, have their influence upon the artist and the buyer alike.

A considerable space is devoted to an account of provincial marks. Most of the ordinances which applied to the goldsmiths of Paris applied also to those of the local manufactories in such places as Montpellier, Marseilles, Cambray, Toulouse, and Rouen, among others, some of which could trace the history of their craft to the thirteenth century. The King, in 1275, ordered goldsmiths everywhere to mark their work with the "seign" of the town in which they dwelt. This sign was generally the coat of

* *Old French Plate; with Tables of the Paris Date Letters, and Facsimiles of other Marks.* By Wilfrid Joseph Cripps, M.A., F.S.A. London: John Murray. 1880.

arms. But in some places the first two letters of the name of the town, or the first letters of each syllable of it, or the first and last letters were in use. Whether arms or letters were used, the date letter was commonly added after the fifteenth century. A great number of different alphabets were in use, and much confusion ensued; but in 1783 all letters were abolished, and a new and peculiar mark introduced, to which the date was added. This new mark unfortunately affords the collector little or no clue to the older one; and Mr. Cripps gives, in addition to a list of the marks used after 1783, another of the arms of the chief towns in which the manufacture of articles in gold and silver was carried on. The ordinances of 1783 were only in force from 1784 to 1789, and the marks are therefore of little importance. Some of them, however, are amusing in their quaintness, and form examples of a kind of "canting" heraldry, in which some local allusion is often made. Thus, Meaux very appropriately marked its plate with a cat. A rising star denoted L'Orient, and a castle Chatillon. A wing stood for Alais, and a wineglass for Beaune. Perhaps the bee of Abbeville was a pun on the word *abbeille*; but the ancient coat of arms of the town contained no bees, unless the fleur-de-lis which decorated its upper portion had originally been bees, as some have imagined. The old arms of Alais, however, contained a wing, and those of Chatillon, a tower. But the arms of Meaux contained no cat, but a letter M. Letters are also found in many other French shields, as in that of Montargis, which showed an M between L and F, or that of Lons, which bore an N, and Riom, which bore an R. Nîmes goes beyond them all in this particular, for her shield is thus described:—"A palm tree on a terrace with a crocodile in fess chained, and the words Col. Nem." Even Sir Izaak Heard could hardly have exceeded this; though letters are not in themselves bad heraldry, and we remember the shield of a German abbey of some antiquity, which bore this cheerful coat—"a black cross between the letters M, O, R, and S." The meaning of some of the French marks is not very clear. It is intelligible, however, why Falaise should bear a lancet, and there is no doubt an equally reasonable explanation of the scalpel of Landrécy and the knife of Langres. The least dignified of all the marks is that of Narbonne, which should surely have borne a hive, but had a tobacco-pipe assigned to it; or that of Nevers, which had a wine-bottle. Mr. Cripps concludes with an account of the French marks adopted in 1797, of which he says that they are of comparatively little value to the amateur, and of none to the antiquary.

A SAILOR'S SWEETHEART.*

MR. RUSSELL has been troubled in his mind by certain critics—"critics," he says, "whose knowledge of the sea I have the best possible reasons for suspecting." This is not his first story of sea life. Some few years ago he wrote the *Wreck of the Grosvenor*. Now these ignorant critics, we learn, "determined that various incidents narrated in that book were impossible." They can now learn that these impossibilities were "all of them *facts*" (the italics are Mr. Russell's) "within the experience of twenty out of every hundred seafaring men." He is aware, he goes on to say, of his numerous shortcomings; but the more he is sensible of them, the more is he "anxious to emphasize the one virtue which"—we again quote his own words—"I honestly know my sea stories possess—I mean their truth." How a man can be said either honestly or dishonestly to know the quality of his own work we altogether fail to understand. But, as we shall presently show, Mr. Russell does not always attach any very strict meaning to words. He is a sailor, and, with a sailor's readiness, he takes, no doubt, the first word that comes to hand, and makes it serves his purpose as best it may. His new story, he assures us, is as trustworthy as his former one. In fact, "there is not an incident in *A Sailor's Sweetheart* that is not true." This may certainly be the case, and yet the story itself may be as grossly improbable as any that was ever written. In the claim that he makes for credibility he acts much as would a cook who should mix up in one dish a hundred ingredients, and then maintain that the whole mess must be wholesome, as there was nothing unwholesome in a single article that she had used. We do not deny that, highly improbable as appear to us many of the details of this story, yet for each some parallel instance might possibly be found. We maintain, however, that the book, taken as a whole, in spite of the author's assurance of his honest knowledge, is as monstrous in its improbability as any novel could be. Its absurdities in this respect might perhaps have escaped our notice had not Mr. Russell by his direct challenge called our attention to them. Credibility is the last quality that we look for in a story of the present day, and some other of his "numerous shortcomings" might have caught our attention even more strongly than the utter extravagance of his plot. But he asks that his story shall be judged by his truthfulness, and by its truthfulness our readers shall presently have a chance of judging it.

We could wish that not only Mr. Russell's facts, but also his words, were within the experience of twenty out of every hundred seafaring men—of four out of five we should prefer to say. He does, indeed, now and then give us a little of the "avast there" and "shiver my timbers" style of writing which was so dear to us when we were young. Quite early, for instance, in the narrative, the hero, who had been wandering somewhat widely from his tale, exclaims, "Let me clap on a bit of extra canvas and claw off this shore, for I am afraid I'm too much of a sailor to feel happy in land togs." One of his sailors "belays eating," and the hero himself at his wedding-breakfast, overcome by his emotions, "belays his eloquence for a spell." Over the waistcoat of an elderly gentleman "lay the bight of a stout gold chain." This is certainly satisfactory so far as it goes, but there is far too little of it. No one, so far as we can find, hitches up his trousers, or makes a profane reference to his mate's lee scuppers. Davy Jones's locker is never so much as heard of. There is plenty of sea talk, but it is no longer of the good old kind. Perhaps the explanation may lie in the fact that the merchant service has followed the Royal Navy, and, like it, has gone to the devil. At all events, it seems uncommonly dull. We certainly did not understand all the sea lingo—to use the correct term—of Smollett and Marryat. Somehow or other, nevertheless, we enjoyed it, in spite of our ignorance. There was a rollicking heartiness about it which was very dear to us. But out of Mr. Russell's nautical terms we can get nothing. Let him not in some future preface class us among those critics whose knowledge of the sea he merely suspects. We have no wish to hide our ignorance, and we frankly own that there are a great many passages in his book which, for all we know, are utter nonsense. At all events, such experience as we have gained in crossing from Dover to Calais and from Folkestone to Boulogne throws no light upon them. We do not pretend for one moment to know what may, after all, be the very ABC of the sailor's art. No sense is conveyed to our minds by such terms as "we lay boxing the yards about to the catspaws," or "rousing everything taut with the jigger," or "the warp rang out as we tautened the bight of it," or "we boused the leech taut and hauled out the bowline." Once indeed—but only once—Mr. Russell condescends to give an explanation for the benefit of readers as ignorant as ourselves. In a foot-note he explains the term *ratching*. *Ratching*, it seems, is "reaching, or fore-reaching—that is, forging ahead when close-hauled." We are reminded how Johnson, perhaps on the only occasion on which he was on board, asked what was the use of a certain part of the ship, and received as answer that it was the place where the lop-lollyman kept his lop-lolly. Perhaps, however, we should scarcely be justified in complaining that the language of a story of sea life is often beyond our comprehension. There are many who can understand, if not all, at least most of Mr. Russell's terms. There are also many others who, by a long course of novel-reading, have utterly lost the habit of thinking that words ought to bear some meaning. For these two classes perhaps Mr. Russell may write. At all events we may justly complain of the strange mixture which he gives us of nautical terms and of what we can only call novelists' slang. His sailor's language we might have stood, but when it is jumbled up with all the silly writing that we look for in an ordinary story, the effect that is produced is as absurd as it is offensive. If we remember rightly, we drew attention to this failing in our review of the *Wreck of the Grosvenor*, but our criticism has been without any good result. Commodore Trunnion or Hatchway alone could supply that vigorous language which would fitly express the reader's sense of the absurdities into which this literary sailor falls. He is great at that vilest invention of these latter days—the art of word-painting. His sunsets and his sunrises and his moonlight nights are more wearisome and more monotonous than even the longest of sea-voyages or the dullest of land stories. He will never let the unfortunate sun alone, but keeps it always setting; unless, indeed, when he makes it rise. He opens his story with his hero on land. He describes at length a summer evening "when the sun has waxed (*sic*) low." The moon at the same time ought surely to have waned high. In page 20 the sun thus waxed, but in page 33 it was up again, and "the sunshine was broad and searching." In page 47 it was again ready for setting—this time over Gravesend. "It filled the air," we read, "with a purple haze, amid which every rope glanced with the glint of a spider's web." A sailor who has got to *glint* was not, we felt sure, far off *sheen*, and so presently we came to "the sheen of the brass compasses." From Gravesend the ship gets down beyond Herne Bay, and "into the devil's own weather for a running-down job." This little bit of nautical language was most refreshing to us. But a fog had come on, and through it "the riding-light merely glimmered like a glowworm, with threads of lustre sticking into the fog like spikes of gold." We pass through description after description with as much labour as a ship would pass through that part of the Atlantic which for miles and miles is covered with sea-weed. At last we arrive in the Tropics, and there the author brings upon his readers a deluge of words which surpasses, we are sure, the deluge of rain which he brings upon his ship. We have a horizontal swell that ran in outlines, the red light of the sun shattered into fragments of lurid crimson by the sea, the skirts of the clouds graduating from slate into a lurid gloom, the tops of a heavy swell lucent with the red western glare, pealing (*sic*) canvas, languid stars, a desperate flash of lightning, and the whole surface of the ocean glancing in the horrid glare like a spectral world issuing out of chaos. At last the author owns that it would be useless for him to attempt to express the character of the sky. Yet he goes on in the next line to say what it most resembled. In this description he gives us not only

* *A Sailor's Sweetheart.* By W. Clark Russell, Author of "The Wreck of the Grosvenor," &c. 3 vols. London: Sampson Low & Co. 1880.

a nebulous haze, and the tail of a comet, but a hue that was extremely ghastly, and a wall of spume and a long high reach of foam. How spume differs from foam we are not told. However, the lumps of foam presently winked like glow-worms. Perhaps this was more than spume could do.

We are leaving ourselves but the smallest space in which to set forth the plot. The briefer, however, that our analysis is, the more easily will the credibility, or incredibility, of the story be seen. The hero is the second mate of a ship bound to Peru. At the opening of the story he is engaged to Nelly Williams, the heroine. He takes a sad farewell of her; but, after they have set sail, finds that she has taken her passage in his ship. A storm comes on, and the man at the wheel is struck dead by lightning. He remains, however, in "an erect posture" till his fingers are loosened. The next day a boat is picked up, in which are found the captain and the mate of a ship who had been turned adrift by their own men. The ship, though it was out of sight, is pursued and caught. Soon after the hero's captain goes mad and hangs himself. Next, the wreck of a brig is seen. The hero and two sailors go to it in a boat. He climbs on board, and finds it almost full of water and abandoned. At that moment the boat gets adrift with the two men in it. One of them breaks his oar, and so they cannot regain the brig. A breeze rises, night comes on, and the unfortunate hero is carried out of sight both of the boat and his own ship. Some days afterwards he is awakened from a deep sleep by the heroine, the faithful boatswain, and a couple of sailors. Their ship had been wrecked, and all had been drowned but these four. Happily they had come across the brig when they were almost dead with hunger and thirst. The faithful boatswain of course dies, for faithful boatswains never live to see the end of the story. An island is discovered where no island had ever been known up to that time. The brig is run aground, and is put into some kind of repair. But a sudden breeze rises, and she is blown off the shore, while the two sailors are left on land. The hero and heroine have now to manage the vessel as best they may. But there was still one too many to satisfy the author, and so the hero tumbles overboard. Happily the heroine has presence of mind first to throw him a plank, and then to let the boat drop into the water. We could almost have wished that she had in doing this tumbled over herself, so that, for a brief space at least, all the crew and passengers might have, to all appearance, been got rid of. He gets back to the ship, and regains the island. In his absence one of the sailors had gone mad, and, failing in his attempt to murder the other, had jumped into the sea. His body could be seen lying at the bottom of the creek. "The water was so bright and clear that every detail of the corpse was as brilliantly defined as though we examined it under a concave glass." There is something not a little offensive in such a piece of writing as this. To our mind it is indeed more offensive than the grossness of Smollett, which the present age, rightly enough, so strongly condemns. But to return to the story. An English gunboat comes in sight, and the wonderful adventures are brought to an end. The ship is carried into Valparaiso, where the hero and heroine are married. Such are Mr. Russell's facts. We must leave it to our readers to decide how far he has made good his right "to emphasize the one virtue"—how, by the way, is a virtue emphasized?—which he honestly knows that his sea stories possess.

CHRISTMAS BOOKS.

IV.

TO-DAY we have no cause to complain of the want of splendour of the Christmas books. Rather we might give Messrs. Strahan a friendly rebuke for the *luxe effréné* of their most illustrious volume, *A Picturesque Tour in Picturesque Lands*. The cover is of white vellum, inlaid in mosaic with red and green. The top edge is gilt, and the leaves are of Dutch paper uncut. The very pretty vignettes are printed on China paper let into the text, and, as only three hundred copies are printed for the English market, the book is not only splendid but will soon be very scarce. The Picturesque Tour begins in France, and among the sketches is a capital one of Mont St. Michel. On the whole, however, the smaller vignettes, such as the initial letters and a drawing of a stable-yard, are more pleasing in style than the full-page illustrations. French artists contribute some of the designs; for example, the picturesque "Vision of the Commune." "Fishing in the Seine" is an amusing sketch, though not so humorous as Leech's drawing of the same sport. When Mr. Seguin, the author of the letterpress (very lively and interesting it is), complains that French boys "kick each other's shins," we are reminded that the same unmanly habit has crept into some large English schools. Boxing has almost gone out, and "hacking," an atrocious practice derived from football, has taken the place of the art of self-defence. The portrait of the young German mother (p. 96) is so like a man, and a very ugly man, that one is tempted to ask whether the *couvade* is still practised across the Rhine. However, the young Suabian girl praying at "the woodland shrine" makes amends, for she is prettier than the majority of Teutonic lasses. Switzerland, the Tyrol, Italy, and Scandinavia all receive their share of big woodcuts. Now we must end by warning Messrs. Strahan that, sumptuous as this book is, it is not the sort of book that an amateur can praise without reserve. The woodcuts, when all is said, are commonplace, and just what we get in thousands from the illustrated papers. The letterpress is very good in its way, but it wants distinction. What publisher will bring out a Christmas book, not of huge dimensions, in which the letterpress is literature, while the designs are as delicate and permanently beautiful as those of Gravelot and Eisen? Our gift-books are too big; they sprawl over the table clumsily; they never would tempt the amateur with the charm of a cheap octavo or duodecimo of Jouaust's or Lemerre's. Our English classics might be reprinted, and that in form by no means expensive, with a simplicity and elegance which would make them gift-books always acceptable, and of permanent value. At present much care and money are expended on books which are no more works of art than penny valentines are, books which no man of taste would care to keep, and which are doomed to grow dingy on round drawing-room tables, amidst gorgeous mirrors, and in a wilderness of ormolu. The *Golden Treasury*, or Mr. Arnold's *Selected Poems*, are really more beautiful books in every sense, and more acceptable gifts, than the largest and most copiously illustrated records of summer tours. We venture to speak seriously on the subject, because the fashion of Christmas books is running in a wrong direction.

Here is a little book for children—Miss de Morgan's *Necklace of Prince Fiorimonde*, illustrated by Walter Crane (Macmillan and Co.)—which is not without its faults, but which is in a certain way a work of art. The delicate stamped cloth cover, with its grotesque designs, cannot possibly last; it must soon grow dingy, and then be worn to pieces, in the hands of children. So long as it is unusual to bind books in England, we must expect to have covers of very evanescent prettiness. Of the designs, we prefer the quaint frontispiece with children like those of Andrea della Robbia, supporting on their shoulders the beaded necklace of the Princess Fiorimonde. The little designs at the heads of chapters are also original and graceful. Among the larger sketches, we prefer that of the donkey and the pedlar. Some of the pictures are too "mimsey," if we may borrow a hard word from the "Song of the Slaying of the Jabberwock." Miss de Morgan's stories are perhaps the best modern *märchen* we have seen for some years. She has greatly improved as a storyteller, and the fate of the wicked Princess is as appropriate as that of Gruffanuf in the *Rose and the Ring*.

Messrs. Sampson Low and Co. send us Keats's *Eve of St. Agnes*, a very handsome volume, illustrated with etchings by Mr. C. O. Murray, whose drawings on wood we have already had occasion to praise. The frontispiece represents the lovers but ill-accoutred for fleeing forth into the storm. The owl, that "for all his feathers was acold," is a delightful drowsy creature, cowering among the ivy leaves. We do not care for the "holy man" (Stanza 2). He is too like the Hermit "symbolifixed by a picture of an old cove, none too well dressed, and rather down on his luck," if we may quote the immortal prophet of the Turf, Nicholas of ancient days. The pretty girl (Stanza 7), with the angel overhead, is terribly commonplace. The heroine, with her rich attire "rustling to her knees," is picturesque, but too like an Ophelia. The last etching of all is graceful; but the magic of Keats's poem has escaped Mr. Murray, and, indeed, we doubt whether any artist could render it with a point and some printer's ink.

Among the Christmas numbers the *Belgravia Annual* (Chatto and Windus) seems much the most diverting. Mr. Payn's story of the "Reduced Dinner-party" alone is enough to convert a cenobite to Pantagruelism, while persons naturally cheerful can scarcely hope to read it without serious injury to that part of the inner machinery which we use when we laugh. Every sentence provokes mirth; but the Colonel's walk in the fog, from the Duke of York's column to St. James's, is the most explosive passage. How, by the way, did the gallant colonel "smell the Devonshire Club" twenty years ago, the date of the legend? Mr. Lucy, Mr. Grenville Murray, and Mr. Dutton Cook contribute other papers, and Mr. Henley vies with a *poeta ignotus*, Mr. Libbel, in singing tuneful *ballades*.

The Green Room (Edited by Mr. Clement Scott. George Routledge and Sons) has every element of popularity. The public, which does not care for mere literary men, loves the writings of actors, who contribute freely to this annual. Mr. Irving's little tale, "The Neighbour's Bairn," is almost too sad. We doubt about the correctness of the negro dialect in Mr. Florence's "Tennessee Tom." Mr. Burnand's "Traveller's Tale" is very impressive. Mr. Byron contributes anecdotes of Charles Kean, and there are a number of other short amusing papers.

High Water Mark (Richard Dooling. Tinsley's Christmas Number) is a very wonderful story with some very wonderful pictures, which are almost as good as riddles, and, by a curious mischance, are never placed opposite the events they are meant to illustrate, but appear several pages afterwards. The tale has all the elements of a comedy. We have a lovely widow, a young man nearly frozen to death, an unjust will, accompanied with the whimsical condition that the heir was to be present in a certain room, at a certain hour, one year from that date. After spending the intervening time in idleness, though the young man believes himself not only penniless, but to be subsisting on charity, he gives a party in the appointed room, and at the mystic hour panels roll back, and an iron safe is disclosed, containing the property of the disinherited youth. The safe has been constructed on such peculiar principles that it is wound up daily by the action of the tide on every day except this one, on which alone it is possible to open it. The very confidential lawyer who on this occasion literally acts the *deus ex machinâ* then expounds the intentions of the testator, and so the tale ends. People's thirst for the marvellous

must be unusually keen at Christmas if they find amusement in such stories as this.

The very large class of people who are interested in African explorations will read with deep interest Mr. Geddie's *Lake Regions of Central Africa* (Nelson), containing accounts of the scenery and inhabitants of the upper part of the Nile, Congo, and Zambesi rivers. Though apparently not himself a traveller, Mr. Geddie has digested most carefully the works of those who have penetrated far into the interior, and has compiled a short and, as far as we can judge, a very accurate sketch of the investigations and their results. To this are added some maps, and a preface stating the earliest attempts at exploring. It is rather amusing to find Mr. Stanley seriously considered from the point of view of a missionary, and to read of King Mtesa being induced to adopt Christianity on his representations. Precept must be singularly severed from practice in the mind of the King of Uganda.

The new edition of the *Vicar of Wakefield* (Bickers) is only noticeable on account of the twelve photographs from modern pictures with which it is illustrated. Of these the most pleasing and unconventional are the Vicar taking leave of his eldest son, by Stothard, and the two sisters preparing Moses for the fair, by Maclise. In this, however, as in Newton's "Return of Olivia," poor little Dick and Bill fare very badly, having much more the air of babies just able to walk than of the sturdy young people they really were.

A Christmas Child (Mrs. Molesworth. With Illustrations by Walter Crane. Macmillan and Co.)—Mrs. Molesworth's books, charming as they often are, are sometimes very puzzling. One never quite knows for what particular age they are most suitable, and though they are generally about very little children, they would probably not be understood by them. *A Christmas Child* is, however, an exception to this rule. It is a pretty story about a tiny boy, and would only interest little people a very few years older. The illustrations are extremely graceful, and are a great addition to the book.

The matter in *Peter Parley's Annual* (George and Sons) is less varied than usual, but will not receive a colder welcome on account of the greater length of its stories. There is a tale of a runaway boy, an episode in Byron's boyish life, and a sketch from the Crusades, in which Richard I. is made to talk in the peculiar style that our mediæval ancestors are supposed to affect. In reality he probably swore a good deal. The pictures, both coloured and otherwise, could well have been omitted.

Between her inexhaustible invention and her endless travels, material never runs short in Lady Barker's stories. *The White Rat* (Macmillan and Co.) and Jemmy the Monkey came from very different parts of the world, but, like most of their fellow-creatures, they each had a history, while, as for Kaspar, the bear, his virtues and courage are worthy of all imitation.

The History of Good Dog Fanny; and other Stories (Mrs. Gaskell. Nelson and Sons).—Mrs. Gaskell's name is of itself sufficient guarantee that these tales will be simple and interesting and suited to the children for whom they are written. We think that the adventures of the monkeys will prove the favourite.

Family Fortunes (Edward Garrett. Nelson and Sons) is what it purports to be—a domestic story of the Scotch middle classes. It gives a tolerably fair idea of the life they lead, and of the privations that Scotch parents will undergo in order to obtain a good education for their children. The book is, however, unnecessarily drawn out.

Tuscan Fairy Tales; taken down from the mouths of the People (With Sixteen Illustrations by J. Stanley, engraved by Edmund Evans. Satchell).—The amount of "local colouring" in these stories is just sufficient to lend the old tales a new charm. The "Little Convent of Cats" is merely the story of the good girl who did her work and was rewarded for it, and her ill-conditioned sister who wants the reward without performing the work. "The Woman of Paste" is the history of a remarkably sagacious Prince who refused to have a wife that could not laugh; and the "Three Cauliflowers" is a Tuscan version of "Blue Beard," in which Fatima gets the better of the monster. Here and there Italian rhymes are scattered, which, once read, take pleasant hold on the mind. The illustrations and the letterpress are printed in sepia, which has a curious, but not unpleasing, effect.

Shakspeare's Stories Simply Told (Mary Seamer. Nelson).—It seems a pity to take any roundabout ways of introducing Shakspeare to children, particularly as children who could understand and appreciate these stories would be quite capable of reading the original. Miss Seamer says in her preface that "care has been taken to omit any expression which might be deemed unsuited to young readers;" but it may be doubted whether children who begin at an early age to read Shakspeare ever get the slightest harm from any of the plays, as they merely pass over what they do not understand, and are quite content to leave it alone. Still, granted that a prose rendering is preferable, Miss Seamer has done her work very well. The illustrations, which are in outline, vary considerably in merit, but for the most part are tolerably good.

Warne's Illustrated International Annual (Edited by Joseph Hatton. Warne and Co.)—The best story in this Annual is "Waldemar's Violin," by Lady Lindsay. It is full of pretty pictures, and the mysticism, if one may call it so, is not overdone. "Along the Sea Walk," by Barnet Phillips, is a rather unreal American sketch with no particular merit. The rest of the tales are of a more sensational character.

Under Slieve Baw (R. E. Francillon. Grant and Co.'s Christmas Number for 1880) is a well-told tale of Ireland in '98. This is a complicated Enoch Ardenish sort of story, and contains many sensational incidents, but unlike *Enoch Arden* every one is ultimately made happy.

The Leisure Hour (56 Paternoster Row) has a more brilliant exterior than usual; but its long story, "Nine-Tenths of the Law," is hardly up to the usual mark. Some readers may prefer Miss Beale's "Idonea," which has its scene laid among the rivers and castles of Northumberland.

As might be expected from its name, the *Sunday at Home* (Religious Tract Society) contains more distinctively religious matter which will take the conscientious reader many months to get through. The stories are of the usual sort, quite harmless and sufficiently entertaining.

The Fortune-telling Birthday Book (C. A. M. Burdett. Routledge and Sons).—The prophecies here only differ from those in other birthday books from being less known. Of course the more definite they are, the less likely they are to hit the mark.

Christian Herald Annual, 1881.—These stories are lively and pleasant reading, and have the happy endings suitable for Christmas stories.

With true German taste, the *Birthday Book of German Literature* (J. W. L. Nelson) is printed in light blue, and has a red and gold cover. Surely the world has had enough birthday books.

The Following of the Flowers (Marcus Ward and Co.) is sufficiently pretty to make us regret the coarse colouring of the illustrations. The letterpress tells of different famous gardens, and then goes on to speak in detail of the flowers themselves. Woven in with this are songs gathered from various poets in praise of the flowers.

The Fisherman's Boy (Nelson) is an old-fashioned tale of the kind known as "Sunday books," with the phraseology peculiar to works of this class.

We have left ourselves scant space this week for notices of Christmas Cards, but must say a word in praise of those published by Messrs. Eyre and Spottiswoode. Here we have "folding *menus*" in the style of ancient Hellas, of India, and of the United Kingdom, rose, thistle, and the prickly shamrock being all represented. Happy thought for a poem by Miss Parnell—"Touch not the shamrock, lest it may sting thee!" A combination of *menu* and "name-card" is particularly ingenious. Floral almanacs, floral Christmas cards, designs representing the happy inmates of well-regulated *aquaria*, all appeal to the genial tastes and frolic fancy of the delightful and long-desired season of Yule.

We should have mentioned in our last notice of Christmas Books that the *Boy's Own Annual* is published at the office of the *Leisure Hour*.

MINOR NOTICES.

MR. WEDMORE has chosen to prefix what his peculiar taste leads him to call a "prologue" to a second series of *Studies in English Art* (1); and in this prologue there is much matter of the utmost importance to the world at large. What can be more interesting and desirable than to learn that, if Mr. Wedmore had dedicated his book to anybody, which he has not done, he would have dedicated it to a friend who "joins to a particularly sensitive and learned appreciation of art the wisdom of never having written anything about it"? Whether Mr. Wedmore shares this mysterious friend's appreciation or not is perhaps an open question; but it is surely a pity that he does not share his wisdom. But it is not so much to exhibit his friend's wisdom as in order to come, by a somewhat tortuous way, to an explanation of his own that Mr. Wedmore brings in the subject. He pictures this friend asking him "awkward questions." "Why, for instance, he may say, do I include this chapter on Romney, in which I have placed first in my volume so sterile a bit of work?" The ridiculously affected answer to this purely imaginary question need hardly be quoted; but it may be worth while to point out that, for reasons which will be plain to people well up in contemporary art literature, the chapter on Romney is certainly not the worst in the book. "Again," says Mr. Wedmore, convinced apparently that his book will give rise to discussion, "it may be objected that, in a volume of *Studies in English Art*, there is included a study of Méryon, a wild but engaging personality, known to some chiefly as a French bastard, who was the etcher of Paris." Whether it is probable or not that any one will be at the trouble of making objections of the kind which Mr. Wedmore has foreseen, it is tolerably certain that a good many people will "object" to art matters being handled by a writer capable of so execrable a piece of bad taste as is contained in the lines just quoted. It seemed as if in the "study" of Méryon's works which we had the disagreeable task of reviewing in these columns some time ago, and which is here reprinted, the author had gone as far as he well could in the direction of the mingled bluntness of perception and affectation of manner which recall memories of "Janus Weathercock;" but it must be admitted that in the sentence about Méryon in his "prologue" he has outdone all former efforts. Then, to paraphrase a sentence of the author's own, "then, Mr. Wedmore's style."

(1) *Studies in English Art*. Second Series. By Frederick Wedmore. London: Bentley & Son.

Here are two specimens of it taken from the "study" of Cruikshank:—"As Time went on apace, neither the passage of Time itself, nor the hard work which crowded the days of his maturity in art; nor the comparative neglect of the later years, when Cruikshank, no longer quite in the movement of the day, was solaced by visits in the Hampstead Road, chiefly of a very few who were collectors of his work, or of some stray humourist still faithful and confident in the achievements of so many years ago—as Time went on, Cruikshank wore well and slowly, so that it was truly said of him that he looked as if he had once been very old and then had forgotten it." Here, amongst other choice beauties, there is, it will be observed, not even one halfpenny-worth of verb to an intolerable deal of nominative. Another sentence not less remarkable, in another way, is this description of Cruikshank's illustration, in *Oliver Twist*, of Sykes on the house-roof:—"An ugly corner of one forgets what obscure quarter, the squalid house, the chimney with rope tied round it by the escaping and hunted man now staggering on the broken-tiled roof, the evil and worn face, the energy of action—that is the main subject." Mr. Wedmore should surely have italicized "*one* forgets" to show that he meant the word to stand not for the generality of people, but for "the immense critic." What, again, does Mr. Wedmore think he or any one else gains by his beginning a paragraph as he begins the very next one, in a style which reminds one of nothing but Pumblechook's hurling arithmetical questions in a jerky way at Pip, "And *Miss Eske*"? If Mr. Wedmore's affectations and pedantries and pieces of bad taste were a trifle less glaring and repellent than they are, one might hope for his shaking them off; since sometimes, and especially in his chapter on Mr. Burne Jones, what he has to say is in the main true and sensible enough. But even wiser thoughts than his would be ruined by so horrible a fashion of utterance, and there is an air of elaborateness and satisfaction about Mr. Wedmore's worst pieces of literary composition which leaves no room for believing that he will cease to admire his own method.

Mr. Gunn has prepared a new, revised, and enlarged edition of Mr. Timbs's *Abbeys and Castles of England and Wales* (2). The work is handsomely and carefully got up, and is well suited for a gift-book.

Mr. Eden's volume about Africa (3) is skilfully compiled and arranged from the narratives of "a few travellers," concerning the principal divisions of the continent, and has been produced with the hope of awakening interest in the subject, and inducing the reader to consult larger works. This it is pretty certain to do. The general account of the country with which the book opens is clearly and attractively written, and Mr. Eden has taken in his subsequent chapters exactly the points which are best suited for his purpose.

There is much matter of interest and importance to be found in Mr. Kinsey's Report, with its appendix, of the Proceedings of the International Congress on the Education of the Deaf (4). He himself, like the other contributors to the volume, is strongly *in* favour of the "German" system, and we confess that we cannot see what arguments there are to be brought forward on the other side. A brief extract from a contribution by Mrs. Hall, the principal of a private school for the deaf, may give some general notion of the points at issue, which we cannot within our present limits notice, as it might be interesting to do, in detail:—

> The belief that the voice of the deaf must be harsh and unnatural is one of the greatest obstacles we have to overcome in arguing for the "German" system. In England many people have known or heard of deaf persons educated under the method introduced by Wallis and Braidwood, whose voices are most harsh and disagreeable, and erroneously supposing this to be the same as the "German" system, they blame the "German" for a failure which is, in truth, the natural result of a degenerated "Combined" system into which signs and finger-talking have been introduced. As I originally taught them, my pupils were examples of this. Those who heard them speak condemned their voices as harsh and unnatural. Taught now by the "German" system, the same people say they are not unpleasant and are easy to be understood. This I attribute to the constant use of the voice, together with my own increased skill and watchfulness in teaching.

As to the question of signs and finger-talking alone being used, there are some remarks later on on the importance to the general health of exercise being afforded to the lungs, and this seems indeed a sufficiently obvious consideration. Apart from this a person who, although stone deaf is not dumb, is of course in a better position than a deaf mute. The book is one which should be examined by all who have any interest in a question which is of high importance.

The second volume of Mr. Miles's *Pugilistica* (5) affords no less curious and entertaining reading than did the first. No one could be better fitted than Mr. Miles for the task which he has undertaken, and his pictures of the strange doings of the times when "The Ring" was in its glory are very vivid. He writes, not unnaturally, with a strong bias in favour of an exploded practice, and his remarks on the conduct of magistrates who did or did not interfere to prevent prize-fights are amusing; but, when he has to record occasions on which, as at the famous fight which is to be described in his last volume, the ring was broken, and a scene of turbulent disorder took place, he extenuates nothing, but writes of what occurred with severe indignation. There are many instances of the extreme good-nature and even affection displayed to each other by rival pugilists before and after their contests; and in this respect the practice of "The Ring" contrasted advantageously with that which prevails in the only surviving form of prize-fight, the German students' schläger-duel, on which Mr. Miles made some inaccurate but not altogether unjust comments in his former volume. For the member of one corps to have any social relations with the member of another with whom he may be told off any day by his captain to fight would be a startling breach of etiquette. Of the lives included in Mr. Miles's present volume, those of Tom Spring and of Langan are perhaps the most interesting, and both men seem to have been peculiarly distinguished by chivalry towards their antagonists.

The present issue of the *Cambridge University General Almanack and Register* (6) is remarkable for one passage the full absurdity of which can only be realized by University men. Early in the book comes a long list of "Officers of the University," beginning with the Chancellor and ending with the Distributors of Crane's Charity. Then there is a head-line "University Officers," surmounting this extraordinarily heterogeneous catalogue:—

> *Organist.* G. M. Garrett, Mus.D., St. John's. *Clerk.* Henry Smith. *Marshals.* Henry Boning and J. Sheldrick. *Curator of the Botanic Garden.* R. Irwin Lynch. *Curator of the Fitzwilliam Museum.* Prof. S. Colvin, M.A., Trinity.

A new and revised edition has appeared of Messrs. Warne's *Model Cookery-Book* (7), with many illustrations in colours, prepared by Messrs. Kronheim "from the objects themselves."

We remember a work by the author of *Party-giving* (8) which was called *Society Small-Talk*, and in the course of which the writer gave us some entirely new, original, and hopelessly blundering views as to the proper pronunciation of the French language in singing. With this remembrance we are not surprised to hear in the present work of such dishes as *Langues de Bœuf-decorée* and *Dinde farce aux truffes*. Nor is it strange to come upon this passage, "An æsthetic lady had decorated her dinner-table with a profusion of beautiful flowers, and had arranged the *menu* on the like ethereal principles. Her husband's satirical comment on the florid feast was 'une autrefois (*sic*) mon ami (*sic*), moins de fleurs et plus de nourriture.'" We regret to find that the author speaks with approbation of adhering to the conventional arrangement of *entrées* and *relevés* at an English dinner; but this too is not surprising. It is only fair to add that the book is full of carefully compiled statistics as to the probable cost of various kinds of entertainments, and that the author gives perfectly sound advice on the question of champagne at balls, &c.

A Nest of Sparrows (9) is a succession of scenes, partly imagined, but chiefly drawn from life, among poor children in a large city. The tone of the book is thoroughly good, but not goody; the children are like real children; and the squalid scenes amidst which they pass much of their lives are, it is to be feared, very like real scenes. Some of the incidents are singularly touching; and the writing, which is quite free from affectation, is relieved by pleasant bits of child humour.

The translation by Mrs. or Miss Corey of Daudet's *Lettres de mon Moulin* (10) is, on the whole, spirited and commendable; but the translator fails at times, as most translators will fail, in giving any equivalent for French idiom. Here is an instance of such a failure. "The sea, the wind, they had not their natural voices; at every instant it seemed as though some one were calling me from the staircase; with that a fever and a thirst . . . I put my comrade on his bed, and a sheet over him; *the end of a prayer*" (the italics are ours), "and quick to the alarm-signal."

Miss Buckley's *Life and her Children* (11) is another of the many books which she has made on the subject of natural history. Its title, we learn from the preface, "is intended to express the family bond uniting all living things." To treat of this in a small volume of some three hundred pages, is what may be termed, in common parlance, "a large order." The work may, no doubt, be of use in awakening an interest in young minds as to the subjects with which it deals; and probably that is all that was really intended, although the expression in the preface of some such intention is somewhat marred by the statement that the author has

(2) *Abbeys, Castles, and Ancient Halls of England and Wales; their Legendary Lore and Popular History.* By John Timbs. Re-edited, revised, and enlarged by Alexander Gunn. With Illustrations. 3 vols. North, South, and Midland. London: Warne & Co.

(3) *Africa seen through its Explorers.* By Charles H. Eden, F.R.G.S. London: S. P. C. K. New York: Potts, Young, & Co.

(4) *Report of the Proceedings of the International Congress on the Education of the Deaf.* Held at Milan, September 6–11, 1880. Taken from the English Official Minutes read by A. A. Kinsey, Secretary of the English-speaking Section of the Congress, and Principal of the Training College for Teaching of the Deaf on the "German" System at Ealing. With an Appendix. London: Allen & Co.

(5) *Pugilistica; being One Hundred and Forty-four Years of the History of British Boxing.* By Henry Downes Miles. 3 vols. Vol. 2. London: Weldon & Co.

(6) *The Cambridge University General Almanack and Register for the year 1881.* Cambridge and London: Macmillan & Co.

(7) *Warne's Model Cookery.* Compiled and edited by Mary Jewry. Fiftieth Edition. London: Warne & Co.

(8) *Party-giving on every scale.* By the Author of "Manners and Tone of Good Society," &c. London: Warne & Co.

(9) *A Nest of Sparrows.* By M. E. Winchester. London: Seeley, Jackson, and Halliday.

(10) *Letters from my Mill.* By Alphonse Daudet. Translated by Mary Corey. London: Trübner & Co.

(11) *Life and her Children: Glimpses of Animal Life from the Amœba to the Insects.* By Arabella B. Buckley, Author of "Fairyland of Science," &c. London: Stanford.

hoped to employ "a more systematic way than is usual in ordinary works on Natural History."

Dr. Fothergill's little work on *Food for the Invalid* (12), which is humorously dedicated "To the shade of Edward Gibbon the historian, whose gastronomic proclivities have preserved for us the feasts of Ancient Rome," is not the less a useful book, the receipts given in which may be consulted with advantage, even by people who do not answer to the mystic letters I. C. D. G., which appended to them signify Invalid, Convalescent, Dyspepsia, and Gouty.

"Amung the uther erli reporterz woz Wiliam Wudward, ov the *Morning Kronikel*, who eust to komit u debate to memori, and made sekretli a memorandum ov important passajez. When the 'Hous' roze, he went home, and rote out the hole of the speechez, trusting a litel to hiz memoranda, but chiefli tu hiz memori." The foregoing quotation from *The Literary Ladder* (13) is a specimen of the way in which the whole work is composed, chosen not quite at random, for we have avoided the necessity of quoting any words in which Mr. Reade's or Mr. Pitman's new letters appear. The fact of new letters being employed at all is in itself strong enough evidence against the "Fonetic" system, which may be useful enough for shorthand, but can only, from the specimens hitherto before us, make the learning of spelling from longhand even more difficult than it now is.

Mrs. Gray's volume consists of a series of brightly written sketches (14) of lives of remarkable women, some of which have already appeared in a shorter form in *Good Words* and in *The Sunday Magazine*. The subjects are well chosen and well treated.

The Bishop of Carlisle, as he tells us in his Preface to the new edition of Smith's *Voyage of St. Paul* (15), asked for a copy of the work last year, and was told by his bookseller that it was out of print. He pointed out to the publishers that this was a pity, and they replied by undertaking to produce the present edition, if the Bishop would write a preface to it. The preface, after giving this explanation, points out the qualities which rendered Mr. Smith peculiarly fit to write such a work, and dwells upon the fact that the book is one which should be not merely read, but studied. The Bishop relates how he once complained to the late Dr. Whewell that he had been looking in vain for a copy in the University Library, to which Whewell replied, "Serves you right; every one ought to buy that book." The present edition itself is a corrected reprint of the last published by the author, with certain alterations and additions by the editor.

A second edition has appeared of Mr. Leslie Stephen's well-known work on *English Thought in the Eighteenth Century* (16).

THE IRON TRADE.—*We find from our correspondence that there has been some misapprehension of a reference, in our last week's article on this subject, to a circular issued by Messrs. Swan and Brothers. In the comparison between the week before last and the corresponding week of last year, the reference intended was not to the outturn in a single week, which would have had no bearing on our argument, but to the stock then actually in the public stores.*

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

IRELAND AND THE CABINET.

THE papers which report from time to time the alleged results of the deliberations of the Cabinet can scarcely be furnished with official information. Their statements are often probable, and they may be true; but Ministers are not in the habit of publishing their decisions, except on rare occasions by common consent. It may also be observed that no similar communications appear to have been made to the steadiest supporters of the Government. For the present, it will be prudent to judge the Ministers only by their public acts. It is certain that they have not altered the day on which Parliament is summoned to meet, and it appears that the War Office and the Horse Guards are actively employed in providing reinforcements for Ireland. The general impression that a Coercion Bill is at once to be introduced on the meeting of Parliament may be accepted as correct. It seems impossible that any Government can miss the opportunity of checking Irish anarchy, or, in the last resort, of throwing upon Parliament the responsibility of refusing the means of restoring peace and order. According to one probable rumour, the project of land legislation is in the first instance to be embodied in resolutions. The suspension of the Habeas Corpus and the other necessary measures of coercion can only take the form of a Bill. It would appear that Mr. BRIGHT and Mr. CHAMBERLAIN, after another six weeks of dominant crime, for which they are largely responsible, must have consented to the mode of action which was indicated by Mr. GLADSTONE in his Guildhall speech. If he was not misunderstood, and if he still retains the same opinion, his colleagues probably now agree with him that life and property ought to be protected, even by exceptional methods, when the necessity of intervention is clearly demonstrated. Mr. GLADSTONE would perhaps have been satisfied with evidence which was as conclusive in November as it is at Christmas, if he had not thought the presence in the Cabinet of the two Birmingham members more indispensable to the public interest than any restriction of the operations of the Land League; but, according to some rumours, Mr. GLADSTONE himself has been the last to be convinced. The levity with which secondary members of the Government, such as Mr. MUNDELLA, speak of the Irish difficulty and of the policy by which it is to be encountered, may probably be explained by their necessary ignorance of the intentions of the Cabinet. It is their business to support and applaud any measure which may be officially proposed; and they are careful not to commit themselves to the expression of opinions which they might soon be compelled to retract. Coercion or no coercion, Mr. MUNDELLA will, as becomes him, defend the decision of Mr. GLADSTONE. Mr. ARTHUR PEEL, with less caution, lately gave expression to the opinion which ordinary non-official persons hold with increasing confidence and with corresponding feelings of indignation.

The extreme democratic section of the Liberal party, ably represented by the *Pall Mall Gazette*, still cling desperately to their original protest against any Coercion Bill. Mr. PARNELL has rendered impossible the continuance of the direct support which was not long since afforded to his agitation; but the revolutionary party in England still deprecates the passing of any law which could seriously hamper the movements of its former ally. Mr. BRIGHT's doctrine that lawful force is no remedy for lawless force may perhaps be peculiar to himself; but there are fanatics who imagine that to check by legislation new forms of crime is unconstitutional. The authority of the supreme power to correct the proved deficiencies of the law is a part of every constitution. Since DARIUS thought himself bound to throw DANIEL into the den of lions, there has been no more conspicuous example of wilful and stupid impotence. It may be added that the law of the Irish has, unlike the law of the Medes and Persians, been repeatedly altered under pressure of necessity. It is sometimes contended that a Coercion Act would be not only illegitimate, but ineffective. To ordinary minds it seems that the power of detaining offenders without the necessity of relying on legal evidence would of itself go far to the repression of crime. A Land League member of Parliament, called HEALY, was the other day acquitted on a charge of intimidation, because the prosecutor, who had complained of being forced to evacuate his farm by threats uttered by HEALY and another defendant, swore before the Court that his statement to the magistrate had been wilfully false. The use of terror to prevent prosecutions for terrifying is perfectly intelligible. If a rational remedy were applied, justice would not be so easily defeated. When it is asked why ringleaders in outrages are not prosecuted under the existing law, it is a sufficient answer that in the present state of Ireland they cannot be convicted. It may be added that the Land League now intimidate or punish solicitors who conduct prosecutions against their agents and accomplices; that the magistrates are in danger of their lives; and that the League itself is recruited by force. Respectable Protestant clergymen have been compelled by local Leagues to subscribe to the PARNELL Defence Fund; and many persons have enrolled themselves in the League under a threat of the form of excommunication which is known as "Boycotting." Of one outrage the leaders of the Land League may be acquitted, except as far as they have for their own purposes roused the criminal passions of the populace. In wrecking the Protestant church of Ballynahinch, the local patriots have prematurely disclosed the ultimate tendency of the present social rebellion.

When Parliament meets the explanations of Mr. GLADSTONE and his colleagues will be awaited with curiosity, and received in a spirit which, it is to be feared, may be rather critical than benevolent. Unless he can produce a justification of his long-continued inaction, the Government will be convicted of a neglect of duty which, notwithstanding the best intentions, will have been little less than criminal. If it appears that Mr. FORSTER was, in deference to Mr. BRIGHT and Mr. CHAMBERLAIN, refused the powers for which he asked, he at least will not be able to excuse the conduct of the Cabinet. It is not worth while to inquire what may happen, if, after all that has passed, the Government still refuse to introduce a Coercion Bill. It must be assumed for the purpose of argument that they will insist on the suspension of the Habeas Corpus, on authority to disarm districts, and on the prohibition of seditious meetings. Other provisions taken from former Peace Preservation Acts may perhaps be included in the Bill. The great majority of the House of Commons will cordially support the measure, though it will amount to an acknowledgment of the justice of the charges which have been brought against the Government. If such a Bill is required in February, it ought to have been passed in

November. The Land League has in the interval extended its despotism over a large portion of Ireland, but it has invented only one or two novel forms of cruelty and oppression. With the obstruction which will undoubtedly be offered by the Irish members and a small and sympathetic English contingent the House of Commons must deal. The regular Opposition will not commit so gross a blunder as to fail to support the Government in the maintenance of Parliamentary freedom. There is no room for petty sectional divisions in a House which can only assert its dignity by the union of all well-affected members.

The Cabinet is so far unanimous that it continues to exist. It must, therefore, have agreed on the two great questions of coercion and of legislation on the tenure of land in Ireland. Whether the Ministerial project takes the shape of a Bill or of resolutions, Mr. GLADSTONE has probably induced or compelled his colleagues to assent to the simultaneous introduction of repression and of a permanent agrarian measure. Before the beginning of the Session the Report of the BESSBOROUGH Commission will have been completed, and the Ministers are already in possession of its main recommendations. If there were any advantage in discussing a mode of proceeding which will be selected by the Government at its discretion, plausible objections might be raised to the implied doctrine that life and property are not to be secured except at the price of concession to those by whom they are threatened. It would be necessary to strengthen the executive power if no sophist had ever selected the tenure of land as the subject-matter of his paradoxical lucubrations. A more serious objection to the ostentatious association of the two measures consists in the wholly experimental character of any law which can be devised for the regulation of the tenure of land. There is respectable authority for the opinion that the extension of ownership by small occupiers will greatly aggravate both the frequency and severity of distress, and the very evils which the advocates of the scheme desire to remove. The objections to peasant proprietorship are perhaps not insuperable, and they will certainly be disregarded by a Government of which Mr. BRIGHT is one of the most resolute members, and which will be advised by Mr. SHAW-LEFEVRE. The objections to fixity of tenure, with arbitrated rents and saleable tenant right, are economically conclusive; but, if the scheme is recommended by Lord BESSBOROUGH and his colleagues, it will probably be adopted. There is no want of experts who predict the failure of the plan; and neither fixity of tenure nor purchase of their holdings by the occupiers will conciliate the Land League. It is easy to imagine the repugnance with which a section of the Cabinet will acquiesce in the decisions of colleagues with whom they have not a feeling nor an opinion in common; but the weaker party, which may perhaps not be a minority, judges wisely in postponing as long as possible the inevitable disruption. It is desirable that the whole Liberal party should be responsible for the approaching legislation. The influence of the moderate section will have been more effectively exerted within the Cabinet than in Parliament or out-of-doors. The remarkable suspension of all reports of resignation of individual members perhaps represents a comparatively moderate scheme of legislation.

THE BONAPARTIST REVIVAL.

BONAPARTISM has unexpectedly shown that it is still alive and still vigorous. Prince NAPOLEON has started a halfpenny newspaper of his own in which he repudiates the compromising alliances which have done the party so much mischief, and proclaims a policy which shall avoid the two extremes of reaction and revolution. Bonapartism, on the PRINCE's theory, can never be either clerical or destructive. It will know how to defend the State against extravagant pretensions on both sides. It will truckle neither to the Church nor to the Commune. It is not so very long ago that this programme would have had no attractions for the French people. They would have pleaded that they had already in the Republic all that Prince NAPOLEON could possibly offer them. So long as this could be said with any truth Bonapartism had no chance. It tried to make one by associating itself with the reactionists, but in doing so it only did additional injury to itself. But of late the Republic has opened fire upon the Conservatives from all points at once. They are not even treated as belligerents to be fought and beaten, but as rebels to be disarmed by way of precaution. If all the measures that are now in the air are adopted, it is hard to say what means of action they will retain, and if any prove to have been left to them by inadvertence, the mistake will promptly be set right. In order to estimate the prospects of the Bonapartist revival, it is essential to give full weight to the extraordinary change which has come over the character and policy of the existing Republic.

The dispersion of the great teaching orders was intended to deprive the middle classes of the bringing up of their own children. Wealthy men to whom the cost of education is immaterial, and who do not want to start their sons in an official or professional career, can still choose teachers for them. They can send them to the schools which the dispersed orders will set up in England, or they can keep them at home and employ the members of these dispersed orders as tutors. But the middle-class Frenchman will be in a different position. He has not the money to do either of these things; and, even if he had, he cannot afford to endanger his son's prospects. A foreign education, or a home education, is a bad preparation for competition in State examinations with young men who have been brought up in State schools. Still, in a country in which every man has a vote, the education of the middle classes is not as determining an element of policy as it is in countries where the suffrage is restricted; and, if the Church can retain the education of the poor, she may hope to survive the alienation of the class above them. The Education Bills now before the Legislature show that the Republican Government is quite as much alive to this as the Church can be. The Chamber of Deputies has already determined that elementary education shall be free, secular, and compulsory. If this arrangement is really carried out, the peasantry will no longer be allowed to leave their children untaught, and, as they will not be able to teach them at home, they will be forced to send them to school. In theory they will be at liberty to choose to what school they will send them. As a matter of fact, there will usually be but one school, and, even if there be more than one, education at the communal school will be free, while at any other school there must, with rare exceptions, be a charge made. The cases in which a French peasant will pay money for his child's schooling when he can have it for nothing will probably be few. When the Church is thus headed as regards the training of the young, she may be inclined to try her hand upon grown men. If she can no longer get at the children, it becomes all the more important to get at the parents. Something, indeed, has already been done in this direction. In nearly a hundred French towns there are Catholic Working Men's Societies, including several in Paris itself. What success these Societies have had is not very clear; but it has been enough to justify the holding of a "Congress" last September, and to recommend them to the attention of the Government. Their existence is at best precarious, since they are only authorized by a prefect's decree, which may be revoked at any moment. The Republican journals have been greatly shocked that Associations which are simply so many instruments of propagating anti-Republican doctrines should continue to exist under a Republic which has the power to suppress them. The prefects have at last realized their duty in the matter, and the offending Societies are being everywhere dissolved. In mere pity for the poor misguided workmen who might otherwise be seduced into joining them the Government could not do less. The active diffusion of Catholic ideas is inconvenient to the Republic; and, as the state of the law with regard to Associations gives the Government the power of checking it, their supporters are not inclined to allow them to leave this power unused. To men in this humour no weapon comes amiss. The Royal and the Imperial armouries are alike made to give up their dead. When the Church is the object of attack every precedent is good, whether it breathes the spirit of LOUIS XIV. or the spirit of NAPOLEON I.

A remarkable instance of this has lately been furnished by the *République Française*. The Government and the POPE were for some time unable to agree as to the filling up of certain vacant bishoprics, and as the Concordat, while it assigns the nomination of bishops to the State, reserves to the POPE the right of conferring

canonical institution, it has commonly been supposed that the State would have to go on making nominations until it found some one whom the Pope would accept. The *République Française* insists that this is altogether a mistake. The Fourth Article of the Concordat does, it is true, make this division of powers, and if there were no further legislation on the subject, the refusal of canonical institution by the Pope would be a case not provided for. But there has been further legislation. In 1811 a National Council of more than a hundred bishops assembled at Paris, and decreed that, if the Pope did not confer canonical institution on the bishops nominated by the State within six months from his appointment, the Metropolitan, or, if he refused, the senior bishop, of the province should confer it instead of the Pope. This decree was presented to the Pope by a deputation of bishops, and confirmed by him in a brief given at Savona on the 20th of September, 1811. All therefore that the Minister of Public Worship has to do is to nominate what bishops he pleases, and, if the Pope refuses to give them canonical institution, to let the six months allowed by law to run out, and then to call upon the Metropolitan to give it. It is hard to say whether the impudence or the rashness of this suggestion is the more remarkable. Its impudence appears in the mention of the place at which the Papal Brief was signed. Why is it dated from Savona, and not from Rome? Because Pius VII. was then a prisoner in the hands of Napoleon I. The Brief was issued under duress, and even then did not satisfy the Emperor, because it was not in all particulars a reproduction of the decree on which it was professedly founded. Nor does the decree itself deserve any more respect. The so-called Council at first declared itself incompetent to entertain the question of canonical institution, and it did not find out that it was competent to entertain it until violent pressure had been brought to bear by the Emperor upon the bishops. Even if the decree and the Brief were not alike nullified by the circumstances under which they were obtained, what could be more insane than to set up, nearly a century after the Revolution, a fresh succession of "constitutional" bishops and priests? Even Prince Bismarck kept clear of this last blunder. He refused to recognize the Pope's bishops, but he did not try to force a Catholic population to accept his bishops instead of the Pope's. Such a proposal is all the more irritating that it is made by a journal which is constantly proclaiming that the separation of Church and State is a thing not to be permitted. The Church is not told to choose between accepting the disabilities and resigning the advantages of her position. She is plainly warned that she will have to keep both.

A French Conservative who sees that he is to be practically prevented from propagating his opinions, or a French Churchman who sees that he is not to be allowed to have bishops such as he can accept, might heretofore have comforted himself with two reflections. There was a chance that the new Chamber might be less revolutionary than the existing Chamber, and the chance that, under a process of judicial interpretation, the new legislation might prove insufficient to produce all the results which its authors expect from it. It is plainly intended that the victims shall no longer enjoy either of these consolations. The present constituencies are not sufficiently under the control of a central organization to vote the party ticket with becoming certainty and completeness. Too many reactionaries still creep into seats, and delay, though they cannot prevent, the adoption of salutary laws. Under the *Scrutin de liste* the number of the constituencies will be reduced and the number of members for each constituency increased; and it is hoped that in this way the Conservative minority in each department will everywhere be an unrepresented minority. It is another question whether in the long run extreme Republican views will gain by the change; but there can be no doubt that the opinion of extreme Republicans is that they will gain; and certainly it is only in a somewhat dim future that any indication of a contrary result can be discerned. The next Chamber, in all probability, will be more Radical than the present. In that case the only refuge left to the Conservatives or the Church will be the Courts of Law, and of this the Magistracy Bill now before the Senate proposes to deprive them. What does it matter that an old law turns out to be inapplicable to the case to which it is sought to apply it, or that a loophole has been discovered in a new law which [illegible] a way of escape from it? Such discoveries are [illegible] valuable when there are independent judges to whom the question can be referred. In France for many a year to come there will be no independent judges. They will all be at the mercy of the Government for a year after the Bill becomes law, and a Government which has sacrificed so much to obtain the right of dismissing them may be trusted not to let the right go unused. Thus the Republic is, to all appearance, determined to convince the Conservatives that they have nothing to gain by submission. They are to be executed anyhow; the only choice left them has reference to the position in which they will await the final stroke. It has yet to be seen whether the Republic has been wise in thus driving its enemies to bay. Prince Napoleon evidently thinks that it has not been wise. He sees a new opportunity opening out before him, and at once reaches forward to seize it. He does so, no doubt, in a way special to himself. He does not present himself in the character of a Conservative, because to do this would be to dissociate himself from the active forces of French politics; but he offers the Conservatives the choice between a reasonable democracy and a democracy filled to overflowing with theoretical and fanatical enthusiasms—between a democracy which will leave them alone and a democracy which will eat them up. It will not be surprising if in this aspect Prince Napoleon should more and more come to be regarded as the protector the Conservatives have vainly tried to find among their own party.

IRISH ANARCHY.

THE obstinate resistance of the extreme Radical party to the employment of vigorous methods of repression in Ireland is probably not to be attributed to any direct sympathy with the projects of Mr. Parnell. Mr. Bright, Mr. Chamberlain, and the evening journal which expresses, with some additional bitterness of its own, the opinions of the ultra-democratic party, tolerate seditious anarchy not for its own sake, but in the belief that the existing reign of terror will induce the Government to propose a sweeping measure for the readjustment of property in land. It is not surprising that Radical writers should have at the same time welcomed and ridiculed the remarkable document in which Mr. Forster calls the attention of local authorities to the nominal provisions of the actual law. The Irish Government itself does not escape the censure of its friends, although they willingly accept the apparent admission that exceptional securities for life and property are comparatively superfluous. Their attacks on the magistrates and police are more unqualified; and yet the Irish Constabulary have throughout the disturbances exhibited all the courage, the discipline, and the unsuspected loyalty for which they are justly renowned. There may be some pretext for the complaint that they are not remarkably successful in detecting crime; but they have not a fair opportunity of displaying their sagacity. In many cases they know the criminals who, as ringleaders or as hired assassins, have executed the mandates of the Land League; but it is useless to arrest or prosecute offenders against whom no evidence will be forthcoming in a community consisting of their accomplices. The magistrates are still more powerless, because they are themselves exposed to threats and violence. If the police had been three months ago authorized to arrest in every district a dozen or a score of the paid agents of the Land League, and if the demagogues had been restrained from making inflammatory speeches, tranquillity would perhaps have been re-established as under the Westmeath Act of 1870. Even now the peaceable part of the population would be encouraged by decided action on the part of the Government to refuse obedience to the League. The shameful and selfish negligence which has supplied the disaffected population with arms will hereafter perhaps bear its fruit in the form of civil war. The immediate wants of Ireland are the suspension of the Habeas Corpus, the prohibition of seditious meetings, and the prevention of the further acquisition of arms. No plausible excuse has been given by the apologists of the Government for its refusal to discharge the plainest of duties. The condition of Ireland has become week by week more dangerous and more intolerable, although Mr. Davitt lately asserted that the

Land League had never encouraged the perpetration of outrages. The victims are in some cases landlords who have spent their lives in correcting the evils arising from Irish land tenure. Lord KENMARE has spent vast sums and a large portion of his life in improving the condition of his dependents. Mr. BENCE JONES was surrounded by a thriving tenantry, who owed their prosperity entirely to himself; yet, under the direction of the Land League, he is excluded from intercourse with his neighbours. His servants leave him; his neighbours will not buy or sell with him; his cattle cannot be driven through the streets of Dublin or shipped in a steamer for England. Such tyranny and cruelty have not been known since the French Reign of Terror. The English Ministers will hardly acquit themselves of a share in the guilt.

The opponents of so-called coercion, and the theorists who propose the modification or abolition of property in land, are naturally anxious to use the abnormal condition of Ireland as an occasion for creating a precedent which may be applicable to other communities. A writer in the *Pall Mall Gazette*, while he prudently deprecated simultaneous agitation against landowners in England and in Ireland, quoted with unconcealed exultation a recent attempt to transfer Irish communism to England. Mr. GLADSTONE lately stated that he was not aware of any proposal for dealing with the relations of English landlords and tenants on the principles which in exceptional circumstances might be deemed necessary for Ireland. He will perhaps be surprised at a demand which a Sussex farmer appears to have preferred at a meeting of an agricultural association or committee. In requiring fixity of tenure for occupiers who had deliberately agreed to rent land for a limited time, the Sussex Land-leaguer only followed the example of Mr. BARCLAY, who is both a tenant-farmer and a member of Parliament. He also proposed that the amount of rent, notwithstanding the stipulation of any lease or agreement, should be regulated by an independent tribunal; and finally, warming to his subject, he insisted that the tenant ought to be allowed to acquire the freehold by compulsory sale at a price to be similarly determined. The sympathetic journalist chuckles over the sordid impudence of the covetous farmer as an indication of the fate which impends over English landowners. It is possible that the Sussex farmer, or any one of his neighbours, may in the ordinary course of business have borrowed money from his banker. A loan of 1,000*l.* for three months at 5 per cent. would be a not unusual transaction. If the debtor is consistent in dealing with the different persons with whom he may have made contracts, he might propose that the three months should be extended to a perpetual term; that the rate of interest should, at the discretion of a Court, be reduced to three and a half or three per cent.; and finally, that he should be allowed to compound with his creditors on conditions to be settled by arbitration. There is not the smallest difference between the two kinds of contract or the resulting obligations. The lessor of the Sussex farmer must have acquired his land by some process of purchase or inheritance as lawfully as if it had been the capital or credit of a banker. The only distinction between the cases is that the cupidity of the Sussex farmer has been stimulated by pedants and agitators who have selected land as the subject-matter of revolutionary experiment. If the Sussex farmer had studied Continental literature of the same class, he would have found that in other countries capital is denounced by communists as more invidious and more justly liable to confiscation than property in land.

The enemies of landowners are ill advised in dwelling on the undoubted analogy which applies to all schemes of partial or total expropriation. They would be more likely to obtain the united support of the Liberal party for sweeping Irish measures if they could reassure them as to the security of property in Great Britain. The use which theorists have made of the Act of 1870 in their attacks on landed property elsewhere are fresh in the recollection of all who are interested. Prudent agitators will for the moment dwell on the necessity of appeasing Irish discontent, and on the admitted fact that a large portion of Irish occupiers are exclusively dependent on the cultivation of the soil. It might even be judicious to call attention to the wide difference between large farms occupied by capitalists, and small holdings in which it is difficult to maintain a family by hard labour. It is perhaps useless to recommend any form of moderation to politicians who are ready to fish in troubled waters. The same advice may be more urgently impressed on the opponents of the Government. Even if they had a chance of defeating any moderate measure which may possibly be proposed, it would not be for the interest of the Conservative party to undertake the responsibility of legislation. It will be difficult or impossible to reconcile with economic principles any scheme which may be devised to benefit the Irish tenant at the expense of the landlord; but it is certain that something must be done; and those who are fortunate in not having to do it themselves would be ungenerous and unjust if they objected captiously to the proposals of the responsible Government. It would be absurd for English Conservatives to reject schemes which may possibly find favour with the unhappy landlords of Ireland; and it would be suicidal to form an unnatural alliance with the Land League which will assuredly denounce as futile the Ministerial Land Bill. The remonstrances which have been addressed to the Government for its toleration of anarchy are essentially fair and expedient; and it follows that practical support should be afforded to the measures of coercion which will probably be introduced at the beginning of the Session. No sensible member of the Opposition can at present wish to cause a rupture in the Cabinet; nor is it desirable to weaken the Executive Government in the presence of assailants who are also public enemies. Any form of Parliamentary obstruction would be acceptable to Mr. PARNELL.

TURKEY AND GREECE.

THE Note addressed by the Porte to the Hellenic Government, and since communicated to all the Powers, admits of more than one interpretation. It is impossible to deny the right of a State which is publicly threatened with war to anticipate the attack. The excuse of internal difficulties which has been offered to the European Powers would be summarily and rightly disregarded by Turkey. A Government which confesses or affects inability to restrain the aggressive propensities of its subjects invites a rupture with any neighbour who may find himself threatened. The Greeks are now warned that a continuance of their preparations will be followed by a suspension of friendly relations; and it is plainly indicated that the diplomatic rupture will lead to war. Unless the weaker party can confidently reckon on external aid, a deliberate collision with the forces which will occupy the disputed districts would be suicidal. A crushing defeat would be more dangerous to the Government and dynasty than any minor cause of discontent. The cession of Dulcigno has set at liberty a large body of regular troops who have already been withdrawn from Upper Albania. It is estimated that within a few weeks a hundred thousand men may without difficulty be concentrated in Epirus and Thessaly. The Greeks will scarcely be able during the ensuing spring to bring one-half of the number into the field; and it may be said, without disparagement of the military qualities of the nation, that in discipline and solidity the Turkish veterans would have an overwhelming superiority. In Thessaly the assistance of a friendly population might do something to redress the balance, unless indeed the reported antagonism of the Vlaques to Greek supremacy introduces an unforeseen element of confusion. The Northern parts of Epirus are within reach of the Albanian tribes, who, notwithstanding their occasional demand of independence, would probably be faithful to the SULTAN in a contest with a foreign enemy. The inclination of the inhabitants of Epirus is at present doubtful. A recent visitor to the country is of opinion that they are not ready for annexation to Greece, although he thinks that they may hereafter be gradually conciliated. Other authorities may probably arrive at a different conclusion; but it would not be prudent to declare war against a superior adversary in reliance on conjecture.

There seems to be reason to believe that the warlike language of King GEORGE and his Ministers was founded on communications which the KING believed himself to have received during his recent visit to Europe. It is probable that the English Government may have undertaken to co-operate with France; and it is said that M. GAMBETTA, who has always favoured the Greek cause, gave the KING satisfactory assurances. Reports of informal negotiations are not to be implicitly trusted. It is difficult

to believe that M. GAMBETTA would avow to a foreign potentate, however friendly, his possession of the paramount influence which he is popularly believed to exercise. The French Ministry have not confirmed the supposed promises of the PRESIDENT of the CHAMBER, unless M. DE MORNY has been authorized to give fresh assurances of support in his recent conversation with the KING. M. GRÉVY has on more than one occasion shown his unwillingness to tolerate usurpation of his prerogative. There must probably be some foundation for the story of M. GAMBETTA's assurances, for it is difficult to account for the language addressed to the Greek Chamber, if the Government relied exclusively on its own forces. It is impossible to say whether additional encouragement has been derived from Mr. CHAMBERLAIN's unwarrantable declaration that the Greeks, if they went to war, would not be left alone. Mr. GLADSTONE and Lord GRANVILLE have a sufficiently arduous task without the additional embarrassment which may be caused by indiscreet colleagues. If the questionable measure of intercepting the Turkish customs duties at Smyrna was communicated to King GEORGE, he must at the same time have been informed that the execution of the plan was conditional on the participation of some of the other Powers, and especially of France. The English Ministers have since plainly stated that they are not disposed to act alone. By forcing on a rupture with Turkey the Greek Government would thwart the policy of its best friends; and it would probably incur the serious displeasure of Austria and Germany. There is no reason to believe that Russia is disposed to assist in an enterprise which is scarcely consistent with the extension of Slavonic influence. Public declarations are always to be received with suspicion when they conflict with obvious expediency. The KING and his Ministers may perhaps threaten immediate war in the hope of extorting concessions.

A similar interpretation has been placed by serious commentators on the Turkish Note. The Porte might perhaps have made the Greek preparations for war an excuse for refusing all territorial concessions; and there can be little doubt that they would have peremptorily defied their adversary if the Great Powers had not been in a certain sense parties to the controversy. The decision of the Berlin Conference was perhaps hasty, as the award was published without the assent of one of the principals to the arbitration; but when all Europe has concurred in a solemn judgment, it cannot be lightly set aside. The Turks may perhaps have reason to believe that some of the parties to the Berlin Conference are not unwilling to modify a claim which may have partly resulted from misapprehension. In the recent Note the Turkish Government prudently recognizes the principle of a cession of territory, and even refers to its own previous professions of willingness to negotiate. It is true that the Turkish Commissioners caused perpetual delays, and that they would never agree to any proposal of their Greek colleagues; but they and their Government consistently allowed that something must be done. The Note expresses a desire to renew the negotiations; and, if the Greeks are well advised, they will profit by the occasion of delay. The statesmen who have lately applied diplomatic pressure both at Athens and at Constantinople may perhaps have induced both parties to take into consideration some modification of the frontiers which were respectively proposed by the Turks and by the plenipotentiaries at Berlin. The warlike language, the financial sacrifices, and the considerable armaments of Greece may possibly have suggested to the Turkish Government the expediency of settling a dangerous question. On the whole, the tendency of the so-called ultimatum seems to be pacific.

It is unknown how far the Greek Government may have trusted to unavowed auxiliaries as well as to its real or supposed patrons; but both Turkey and Greece are well aware that an invasion of Thessaly and Epirus might probably provoke insurrections in Macedonia and East Roumelia. The apprehension of such a result and of the further complications which might ensue has probably induced Austria, and therefore Germany, to promote a peaceable settlement of the dispute. Russia also is perhaps not disinclined to adjourn for the present an inevitable conflict. Even if the present interests of the enemies of Turkey may coincide, far-seeing Greek politicians will scarcely be inclined to extend and consolidate the power of formidable rivals. They are more likely to inherit portions of Turkish territory which remain for the present under the dominion of the SULTAN than provinces which may acquire nominal independence under a Russian protectorate. Judicious Western politicians, though they are less inclined to indulge in vague speculation, regard with goodwill the prospect of the future aggrandizement of Greece. No other race in South-Eastern Europe possesses the same political and commercial capacity; and a considerable Greek kingdom would be more independent than any minor Slavonic State. It is probably not true that any Government has lately suggested as a compromise the substitution of Crete for Epirus. The incomplete title which is founded on the decisions of the Congress and of the Conference could not extend to an alternative acquisition. It also happens that Crete has for some time past been comparatively tranquil under an endurable Constitution. The Mahometan population would justly remonstrate against a diplomatic transaction which would transfer their allegiance to an alien Government, and it would not be easy to defend an arbitrary arrangement. Hereafter the Greeks may not improbably succeed in annexing Crete and other islands which are now subject to Turkish sovereignty; but Europe cannot afford to allow the disturbance of peace by the premature prosecution of ambitious schemes. It is obvious that the cession of Crete would leave open the claim of Thessaly and Epirus to liberation, even if it were accepted in discharge of its claims by the Government of Athens. If the Greek Ministers studied the report of the late meeting of their friends in London, they will have come to the conclusion that in England there is for the moment little enthusiasm on their behalf. They will do well, notwithstanding the encouragement which may be derived from Sir CHARLES DILKE's speech, to accept the overtures to negotiate which are made in the Turkish Note.

JUDGE AND RECTOR.

LORD PENZANCE will, at all events when he sums up the events of his conspicuous career, be able to enjoy the legitimate satisfaction of having been both actively and passively successful in displaying in no common measure, and in many striking and unexpected lights, that love of law which is happily characteristic of the English as compared with the Irish character. He was active in the good work when he signed the significavits which have consigned Mr. DALE and Mr. ENRAGHT to prison. Again he promoted the good cause passively on the day when Mr. CHARLES addressed the Queen's Bench, and was successful in obtaining the Habeas Corpus and the rules *nisi* which threw upon the learned Judge the interesting and profitable task, not only of disproving that, in contributing to this imprisonment of ritualistic law-breakers, he had made himself (not to mention the Bishop of EXETER) a breaker and not a guardian of the law, but even of rebutting allegations which went the length of impugning his claim to be the Dean of Arches at all. After a few days' suspense he has come out successful on all points; but, thanks to the energy with which prosecution has been pushed in the spirit of persecution, even a formal success can be damaging if it involves any *primâ facie* possibility of the ridiculous conclusion being reached that the real law-breaker was not the man who went to prison, but the man who had sent him there. There are law-breakers and there are law-breakers. But in this case the choice was confined to breaking law in reference to a religious ceremony or breaking it in reference to a legal ceremony. Either Lord PENZANCE in Court or Mr DALE in prison had merely done wrong in a matter of rites and forms; and the action of the Judge, like that of the priest, contains no element of violence, dishonesty, or immorality.

The final decision of the Judges of the Queen's Bench did not, we confess, much surprise us. Had the result been otherwise, it would not have touched the real merits of the question, which lie very much deeper than mere flaws of technical procedure. Lord COLERIDGE and Justices FIELD and MANISTY overruled all the subtle objections raised in the case. Mr. DALE accordingly is remanded to Holloway Gaol, and the application in behalf of Mr. ENRAGHT is refused. But one very notable point, and pregnant, it may be, with consequences of very great importance, was established by the judgment. The claim of Lord PENZANCE to be Dean of the Arches is de-

clared to rest upon his Parliamentary title to the office. Parliament is omnipotent, and it has made Lord PENZANCE Dean of Arches. The one proviso, that he is to profess himself a member of the Church of England, supersedes all other conditions, qualifications, and safeguards imposed either by usage or the Canons Ecclesiastical. It is not to be expected that this settlement of the question will satisfy the scruples of those who deny, and are ready to go to prison for denying, that Lord PENZANCE, however truly he may be by Act of Parliament an ecclesiastical judge, has any spiritual authority whatever. Few people, when the matter is clearly put before them, will contend that spiritual authority, such as can touch men's consciences as well as their purses and persons, can be conferred by the civil power. We have most certainly not yet seen the end of this controversy.

Meanwhile, the real value of the bold policy of which Mr. CHARLES was the mouthpiece in attempting to effect Mr. DALE's release must be measured far more by its effect upon public opinion than by its immediate effect upon the status either of Judge or of rector. The root of the matter is how to indemnify the Church for a distracted past by a satisfactory future. We have no sympathy for law-breaking by judge, prelate, or parson, while that general wrongheadedness, which all through the ritual struggle has been the one touch of nature which has made all sides akin, reduces us to silence on the special wrongheadedness of any particular party on any given occasion. The inquiry, more metaphysical than legal, whether Mr. DALE was justified in his method of testing judge-made law—a method, by the way, borrowed from a certain old squire of Bucks named HAMPDEN—can only be met by the equally metaphysical inquiry how far Lord PENZANCE vindicated his character of a large-minded and forbearing guide in days of difficulty and distress when he took up the office of Dean of Arches by the risky way, when he might have taken the safe one. These considerations may provoke exciting contests of wit for debating societies, but men of practical sense will prefer to ask what can be done to make it impossible hereafter for judges to find themselves in the position in which Lord PENZANCE has been placed by fate, or for clergymen to take the line which Mr. DALE has thought it his duty to adopt, or, least of all, for Unions and Associations to shake their fists in each other's faces in the name of the peace of our Church and of the prosperity of our useful and venerable Establishment.

The immediate failure of Mr. DALE's friends to procure his release is of course a present rebuff to all who suffer under the tyranny of the Church Association. But the movement is not without moral advantage in the suspicion which a contention of so unprecedented a character has thrown upon the whole machinery of persecution in which the Church Association and its allies the Churchwardens of St. Vedast's have hitherto revelled with shameless impunity. If, as we must do, we grant that religious persecution is an anachronism, it follows that its roots are struck in very shallow ground. Persecutors have before now discovered to their cost that their formal victory was after all a moral defeat; and such a disgraceful one as that which has been gained over the hapless Mr. DALE will prove to be really the first in a series of blows which will surely, though perhaps slowly, overturn the dead weight of the exclusive and unsympathetic Puritanism which lies so heavy upon all the functions of the Church of England. Two centuries back the ultra-Protestants were the "law-breakers," and JOHN BUNYAN went to prison. It is now the turn of the Ritualists, and Puritanism, in its rival organizations of the Church Association and the Liberation Society, has shown its capacity for improving on its own sharp, clear lesson in persecution. It is much to be hoped that counsels of wisdom and moderation may prevail, and some *modus vivendi* be discovered by which the two diverging schools of thought in the Church of England may continue to dwell side by side with mutual toleration. England, and the Church of England, can spare neither of them. We should be very sorry to anticipate that Puritanism, or, as it pleases in modern times to call itself, Evangelicalism, would ever be driven out from the confines of one tolerant Establishment. With all its shortcomings, that method of thought has noble qualities, and assimilates itself to the English character in some of its most sturdy attributes. A warning example against such a mistake may be found in the history of the later Roman Church, which forgot its usual prudence when it extirpated the outward manifestations of Jansenism. Since that unfortunate period, the moral fibre of Romanism has visibly weakened, and the area of its intellectual supremacy proportionately contracted. But Puritanism must be taught how to content itself with abiding within the English Church on the terms which it now arrogantly refuses to concede to its rival co-religionists. "Live and let live" is the sum total of the plea of the ceremonial party. "Yes," answers the Puritan, "we are "going to live, and we do not object to your living too, "only your life is to be spent in prison." Whatever may be the faults of the Ritualists, they never have been, and we believe they are never likely to be, guilty of volunteering to act as the amateur gaolers of brother Churchmen. But, long-suffering in this respect as they may be, they have resolved upon retaliating by forcing their antagonists to endure their co-existence as free men within a common Church.

The only possible alternative to this issue is one which no thoughtful man can wish to face. It is disruption, to be surely followed, if not preceded, by disestablishment. No mistake can be greater, on the part of our civil or ecclesiastical rulers, than to suppose that only a few extreme men, who might with advantage be spared, are affected by these measures of persecution. The action of the Church Association is a standing menace to the whole phalanx, compact and formidable as it is, of the old-fashioned moderate High Churchmen. And the unhappy Public Worship Regulation Act, as to the satisfactory working of which its archiepiscopal author can scarcely, we think, continue to boast, is a weapon ready for anybody's hand wherewith to smite his neighbour. If this Act were impartially put in action all round, there are none, "bishops "or curates," who might not be its victims. Happily it is only likely to be used against those for whom it was ungenerously devised, the unpopular party of the day. That party, however, which is fast absorbing the energy and zeal of the growing generation, is likely to be vastly strengthened by the accession of multitudes of quiet men who are, with some reason, alarmed at the present aspect of affairs. How deeply people's minds are moved by the discovery, no longer to be ignored, that the action of the Legislature, as expounded and enforced (we do not say wrongly enforced) by the Courts of Law, has altered, without the assent and consent of the Church, the ancient relations between the Church and the State, may be seen in the important letter in which the eminent and respected Dean of ST. PAUL's goes at once to the root of the matter, and declares that "a State Church "deriving all its rights, duties, and powers from Parlia- "ment" would be rejected by three-fourths of the English clergy. If this be true, disestablishment must before long come within the range of practical politics. We do not wonder that the Archbishop of CANTERBURY, addressing some of the clergy of his diocese, has urgently counselled present moderation in speech and action, and has even held out some hope of relief to the present strained state of affairs from the possible action of Convocation. It may thus be that the reimprisonment of Mr. DALE may prove to be a Pyrrhic victory to his persecutors, and that from the failure to effect his release by mere legal technicalities may date the growth of a sounder public opinion as to the true relations of Church and State.

MADAME THIERS.

It is not often that the wife of a statesman, however eminent, has so wide a celebrity that her death is regarded as a matter of European interest. And yet Mme. THIERS was, except to her own circle, nothing more than the wife of M. THIERS. She had intellectual vivacity, much decision of character, and many gifts of form and fortune. But many wives of great men have had equal merits and advantages, without attracting more attention than awaits every woman whose husband occupies a great position. What gave Mme. THIERS a unique celebrity was her worship of her husband. She was married at fifteen and M. THIERS was then Minister of the Interior. To the husband who had won such distinction at the age of thirty-six with nothing to help him but his keen wit, his irrepressible energy, and his tenacious grasp of a few political principles sensible rather than wide or original, she devoted herself with an ardour that carried its jealous watchfulness into every detail of daily life. Whatever he did, she thought

admirable; whatever he said, she thought sublime; whatever he wrote, she thought perfect. He got up at five in the morning, so she got up at five; he had a fancy for works in bronze, so she adored works in bronze; he thought green suited his eyes, so she made her rooms gorgeous with the colour that he loved. She was a clever woman, but she only valued her Latin because it enabled her to read the classics with him; and she used her knowledge of foreign languages merely to read to him useful extracts from foreign journals. She had wealth and official position, but she was entirely indifferent to social success. Her reception rooms were to her merely the place where those who had the privilege of entering might find M. Thiers. A man who was a friend of M. Thiers was once for all great and good; a man who was not did not exist for her at all; an enemy of M. Thiers was an enemy of the human race. The loss of such a husband to such a wife was necessarily overwhelming, and her only consolation was to prolong by strange and tender devices the worship of the loved one she had lost. She filled his room with every statue, bust, picture, engraving, and photograph of him that she could procure, and reverently piled up on this altar of her affections every journal that spoke well of him. Journals that criticized him could have no place in the sanctuary. There she could be alone with him, and it was not so much with his memory as with his actual presence that she was alone. Devotion so passionate and so sustained was no doubt a high tribute to the character of M. Thiers. However blind a woman may be to faults, she can hardly go on worshipping a man for half a century unless he has much in him that justifies enthusiasm in those who know him best. But what makes love of this kind rare is not that it is difficult to deserve it so much as that it is difficult to feel it. Only exceptional natures can love in this way, and it is perhaps as well that they are exceptional. But when they exist and find a fitting outlet for their powers, and this outlet takes the form of a husband whose acts and thoughts affect the fortunes of nations, they naturally attract the wondering, and perhaps admiring, attention of mankind.

The year in which M. Thiers died was the greatest, if the saddest, in the life of his wife. No homage ever rendered to him was so marked, because none was so spontaneous and sincere, as that which he received from the Chamber when it reassembled, in June 1877, after the change of Ministry which Marshal MacMahon had so suddenly brought about. The Chamber had been prorogued, and was brought together in order to hear that it was to be dissolved. M. de Fourtou gave his account of the reasons that had prompted the stroke of May 16 and of the views of those who had contrived or profited by it. There was, he said, no reason to distrust them, as they had been members of the Assembly of 1871, which had liberated the country. As if by a magical impulse, the whole House, with the exception of the Right, which was awed into silence, started to its feet, and, turning to M. Thiers, shouted with one voice, "Voilà le libéra-"teur du pays." This was the last time M. Thiers appeared in public. For Mme. Thiers this was the crowning tribute of the living to the living. The next which she was to welcome with pride amidst her grief was that of the living to the dead. M. Thiers died on September 3, and on the occasion of his funeral Mme. Thiers showed that, in case of necessity, she could be much more than the shadow of her husband. She acted with courage and firmness, and her resolution was crowned with success. Public feeling pronounced so strongly that the greatest possible honour should be paid to the statesman whom France was mourning, that the Ministry offered to make the funeral a public one at the national expense. Mme. Thiers replied that it was quite right that the State should pay every possible honour to the departed, but that in the procession the first place must be given to the friends of M. Thiers. This was thoroughly in accordance with the views of her lifetime. To have been a friend of M. Thiers was the only title to eminence that she recognized. But the Ministry could not take the honourable part in the ceremony which she left for them, and the funeral was nominally private. But it was the private funeral of Paris and of France. The people seemed absorbed in the one thought of showing how profoundly they felt that the man they mourned was their man, and not the man of the clique that had vaulted into power. The friends of M. Thiers, whom Mme. Thiers had that day to recognise were numbered by hundreds of thousands. Later on she had the delight of dealing, with a weapon of which her husband had left her the possession, a telling stroke against the foes who were trying to undo everything he had done. A few days after the funeral was over the Marshal issued to the electors a manifesto, in which he used in the strongest form the language which his reckless advisers had taught him to utter as his own. It seemed as if there was one thing from which this language must be safe, and that was the criticism of M. Thiers. But the Marshal's manifesto had scarcely had time to circulate through the country when Mme. Thiers had the satisfaction of replying to it in the shape of an address to the electors of his arrondissement which M. Thiers had prepared before his death. This address covered all the ground traversed by the Marshal's manifesto. It showed what a wise and really Conservative statesman would have said in the position of the Marshal. The effect was very great, and nothing helped the Republicans more effectually. It seemed for the moment as if M. Thiers was still as much alive for France as he always was for the woman who lived for him.

It is said that in the three years that it remained for her to live, Mme. Thiers had to undergo a grief almost more poignant than that occasioned by her loss, and to see that this great hero of the State, this liberator of the country, this wise teacher of a listening people, could be forgotten. Nothing to her could be so shocking and so inhuman as that, while she thought of nothing else but of the man she had lost, the world had found so many other things to think of that it hardly thought of him at all. A statue in his memory was not long ago ready for erection at St. Germain, where he died, and the ceremony of unveiling this new image of the precious features seemed to her one to which France would flock with earnest and pressing thankfulness. The day came, and the ceremony was not so much flat as nonexistent. No one came to do official honour, except one or two minor members of the Ministry, who had evidently been told off on what they thought an idle duty. There was no crowd, no throng of eager admirers. A little bit of local business was decently transacted, and that was all. There was nothing wonderful in this. It did not show any strange ingratitude on the part of the French people. It was merely that so much had happened since the death of M. Thiers. New men, new ideas, new quarrels, had come to the front. He was a man as completely of the past as if he had died many years before. No doubt, if it had so happened that a powerful party had been formed which based itself on ideas with which the name of Thiers had been intimately associated, the enthusiasm of the party would have kept alive the memory of its deceased chief. But there was no such party, and it is difficult to see how there could have been. The one main idea of M. Thiers was to do the best thing that could be done at the moment. This is, in itself, an excellent idea; but it is not an idea which can give life to a party. At the same time, it was impossible that Mme. Thiers should see this. To her M. Thiers, living or dead, was an oracle of wisdom, and she fled from a world to which this oracle seemed mute.

SIR R. TEMPLE ON THE CONDITION OF INDIA.

OUR Indian Empire is an admirable topic alike for eulogy or disparagement. It is so vast, so vague, so picturesque that the artist can always find abundant material for whatever kind of picture he is disposed to draw. If he is in search of gloomy scenes, he can find them in abundance in the long list of woes and tragedies to which a vast agricultural population is exposed in a tropical climate; the scourge of great epidemics, the lifelong and hopeless struggles of pauperized masses, the resistless march of drought and famine with slaughtered millions in their wake. If, on the other hand, he is disposed, by position or temperament, to fill his canvas with cheerful scenes and brilliant colours, there is an equally plentiful supply of congenial topics. The very position of the English Government as the maintainer of order, the champion of the weak, the great instrument of civilization and progress to many millions who would otherwise be the prey of conquest or the victims of local tyranny, is in itself a fruitful theme for language of encouragement and hope; and the figures which the Indian Government can array in

support of its claim to administrative success require no adroit handling to render them cogent to the reason, and impressive to the imagination, of all but the most uncompromising pessimists. The consequence is that the condition of India, and the character of the work which the English Government is carrying on in that country, are for the most part expounded to the British public in a series of antagonistic and apparently contradictory statements. The wail of lamentation over a bankrupt Government and a suffering people has hardly died away before the jubilant notes of triumph break upon the ear. Mr. HYNDMAN and the school of writers who adopt his method have scarcely ceased assuming that India, under the hands of its English executioners, is fast bleeding to death, before some cheerful apologist steps boldly into the arena, armed *cap-a-pie* with unanswerable statistics, and prepared to do battle with any one who calls in question the sagacity of the Indian Government, the soundness of Indian finance, and the increasing prosperity of the Indian population.

Among such champions of the administration, Sir RICHARD TEMPLE, it is needless to say, occupies a most distinguished position. He is the very type of the most vigorous, most hopeful, most successful civilian. He has been employed everywhere in the most varied offices, and in all of them his energy, his courage, his untiring force of body and mind, have made a deep impression alike on his superiors, his colleagues, and his subordinates. A long career of hard work under an Eastern sun left him as buoyant, as resourceful, as indefatigable as ever. He knows India as only those few officers whose fortunes carry them into different parts of the country can ever know it. He has compared the peasant of Behar with his counterpart in the well-watered deltas of East Bengal, the rice-fields of Orissa, the dry uplands of Bellary, the barren heights of the Bombay Deccan. He knows the intricacies of finance and taxation with the familiarity of long and responsible experience; he was in charge, at one time, of the most successfully managed, at another of one of the most destructive, famines that India has ever known. Marked, early in his career, by the judicious eye of Lord LAWRENCE, he took a foremost part in the difficult task of introducing order and civilization to the warlike races of the Panjab. In the Central Provinces, in Bengal, at the Court of the Nizam, as a Minister at Calcutta, and a Governor at Bombay—in all alike he has watched with the carefulness of a responsible observer the results of British administration, the evils to which the Indian peasant is heir, and the problems which the English ruler is called by the practical duties of official life to solve. As far as experience goes, no weightier or more competent witness could be adduced. If his testimony breathes somewhat too much of the official tone; if he sees somewhat too clearly the good which the Government has effected, and ignores the mistakes of which it has occasionally been guilty, we are safe, at any rate, with him from the crude inaccuracies of inexperience, the rash and hasty inferences, the dangerous impatience, the ill-considered suggestions which too often characterize amateur criticism of Indian affairs. Sir R. TEMPLE, whatever his other disqualifications, speaks with all the authority of long and varied personal observation. His facts are, to use his own trenchant phrase, "irrefragable, indisputable, demonstrable, unquestion-"able."

The general view which he supports is one which has repeatedly been enforced in these columns. It may be summed up in the statements that the financial position is assured; that taxation is, after every allowance is made for the poverty of the people, extremely light; that a commercial development on an extraordinary scale is in progress; and that the prospects of the country can be best promoted by judicious assistance, on the part of the State, to the various industries and enterprises on which that development depends. As to the finances, the opinion of the best judges has been recently expressed in a practical form which admits of no dispute. The public creditor in England is ready to lend the Indian Government sums vastly in excess of any possible requirements at 3½ per cent. The facts of the case amply justify the confidence which such a rate attests; a substantial margin of revenue over ordinary expenditure has been established; liberal provision for occasional outlay on famine relief has been made; the 163 millions embarked in productive public works are earning a net profit in excess of their interest, and are certain to improve; trade is rapidly, and to all appearance irrepressibly, progressive. At the beginning of the century it was completely insignificant—"of little more importance," to use the language of Mr. McCULLOCH, "than that between England and "Jersey or the Isle of Man"; in 1834 the foreign trade had risen to 18½ millions; in 1879 it stood at 122 millions; and in the present year it is likely to be higher than ever. On the other hand, the measures initiated under Lord MAYO and carried out by Sir JOHN STRACHEY, for imposing financial responsibility on the local Governments, have led to great economies; the cost of civil administration has been reduced; while the interest charge on the public debt, other than that incurred for public works, is 1½ million lower now than it was ten years ago. So long as the profits on opium continue as good as at present, and the loss by exchange becomes no greater, the Indian Exchequer need occasion no anxiety.

A more difficult and anxious problem is involved in the question how the Government can most effectually assist the growth of industrial enterprises and the continued development of trade. India, it has frequently been observed, is rich in almost every raw material with which the manufactures of the world are concerned. Its climate and soil are highly favourable to agriculture; its supply of coal is one of the largest in the world; iron ore is in many parts of the country abundant; its fibres are of infinite variety and amount. On the other hand, all these treasures are to a large extent lost, owing to the want of intelligent enterprise and the necessary capital. The food crop out-turn is, owing to inferior culture, some seventeen bushels per acre lower than that of England, a loss which has to be calculated upon the 160 millions of acres devoted to food crops. Industries of the higher order, with the exception of the infant cotton manufacture, there are scarcely any; of the entire exports only 6½ per cent. are manufactures. Here is the field to which Sir R. TEMPLE is anxious to direct the enterprise of his countrymen. Young Englishmen, he says, ought to be in India buying up the native products, and studying what are the best articles to send to Europe. But then, in order to do this profitably, the young Englishmen must be specially trained, and technical education is the branch of study in which England is most behindhand. We are happy to observe that the Famine Commission has drawn attention to the necessity of agricultural and technical education in the ranks of the Civil Service, and has suggested arrangements by which a certain proportion of officials may be encouraged to devote themselves principally to these subjects. It is in this direction, we believe, that reform is most required, and that the judicious introduction of new men and a new system would be rewarded with the happiest results.

POST OFFICE IMPROVEMENTS.

MR. FAWCETT had an encouraging account to give to his constituents of his administration of the Post-Office. His scheme in particular for the encouragement of small savings has been extraordinarily successful. It is only a month since the plan was extended to the whole country, and in that short time more than a million stamps have been deposited with the Post Office. These stamps have been paid in by means of nearly 84,000 forms, and of these more than 58,000 have been new accounts. It is plain, therefore, that, in providing for these very small savings, Mr. FAWCETT has discerned a genuine want. The proposal to make the putting by of pennies an easier process than when it had to be carried on at home rests on the belief that the desire to have a little money laid up against a day when it will be wanted goes down to the very lowest strata of the working community; and the accuracy of this belief seems to have been vindicated by the result. Mr. FAWCETT appears, however, to be unduly confident that the plan in its present form will not lead to theft. There has not, he says, been a single complaint of a theft having been committed. This can only mean that no such complaint has reached the Post Office; but there is no particular reason why complaints should be carried there. Young servants have many opportunities of stealing a few stamps at a time, and even a single stamp has its value in this new form of Savings Bank account. If a mistress suspects that her stamps occasionally disappear in this way, she may be more careful about looking them up, but she is not likely to communicate her supposed loss to the

Post Office authorities. It may surprise some excellent people that stealing and the wish to provide for the future should go together; but there is reason to fear that the virtue of thrift is not necessarily associated with honesty, and that the desire to save admits, like most other desires, of being gratified at other people's expense. Nor is all saving for the future of a kind which is even conventionally associated with honesty. Men have been known to pay in money weekly to the landlord of a public-house in order to have a debauch of unusual dimensions when their deposits have grown to a sufficient figure, and the veriest drudge may open an account in stamps with the Post Office Savings Bank in order to buy herself a new bonnet at Easter. Mr. FAWCETT says that all danger of theft would be avoided if people would always use stamps perforated with their initials. For a sum, he says, which is almost nominal, sheets of perforated stamps may be purchased, and, under the instructions given to the postmasters, no form will be accepted on which these stamps have been placed. But the class of persons who are most likely to suffer by the pilfering of stamps seldom buy them by a sheet at a time. It is not easy to see why the tables should not be turned, and postmasters forbidden to receive any forms which contain stamps which have not been perforated. If the Post Office authorities preferred it, a distinct Savings Bank stamp might be issued. All that is wanted is some distinctive mark that shall ensure that the stamps which the depositor affixes to the Post Office form have been given to him or bought by him. If only a particular stamp is accepted for this purpose, and if postmasters are forbidden to give the Savings Bank stamps in exchange for ordinary stamps, the necessary protection against theft would virtually be obtained.

It is satisfactory to learn that the number of new accounts which are being opened with the Post Office Savings Banks is increasing faster than it has ever increased before. This is especially significant at this season of the year, since Christmas is usually the time at which deposits are most largely withdrawn. It may be hoped that this increase shows that the working classes have learnt the lesson of the recent depression of trade. There is no question that they had learnt it to some extent even before the recent depression, since, had they not done so, they could not have undergone so severe a trial without appealing more largely either to the Poor-Law or to private charity. If the first use they make of returning prosperity is to repair the losses which their Savings Banks' books have sustained, there will be some reason to hope that habits of thrift are spreading over the country generally. Mr. FAWCETT might with advantage have been either less positive or more explanatory in his criticism of the scheme for compulsory assurance which is associated with the names of Mr. BLACKLEY and Lord CARNARVON. "I, for one," he says, "would never con-" sent to see thrift compulsorily enforced." There are difficulties enough in the way of compulsory insurance, and it is very likely that they would be found practically insuperable; but supposing that it were possible to levy it at an age when the working-man is usually better off than he is at any other time of his life, it is hard to see what theoretical objection Mr. FAWCETT can entertain towards the plan. At all events, the case against it is not so self-evident that it does not need even to be stated. The plan by which Consols to the amount of 10*l*. and upwards may be bought at some 6,000 post offices in all parts of the country has not been long enough in operation to allow of its success being determined. Many hundreds of people, Mr. FAWCETT tells us, have already made investments through this agency, and in no instance has there been the slightest difficulty. If this continues to be the case, it is to be hoped that Mr. FAWCETT will see his way to reducing the minimum amount of investment. It is probable that the number of purchases which would be made if 5*l*. could be disposed of in this way would be very much larger. 10*l*. is more than a working-man—even than a well-paid working-man—can be expected to put by at a time, and the longer the interval between the beginning of the process of laying by and its accomplishment in the shape of a purchase of Consols, the greater is the chance that something may come in to interrupt it.

Two further Post Office improvements are foreshadowed in Mr. FAWCETT's address. One is a reduction in the charge for telegrams, the other is the establishment of a parcel post. On the present year the net profit on the telegraph service will be 500,000*l*., which gives 5*l*. per cent. on the capital actually spent in the purchase, and 7*l*. per cent. on the capital which ought to have been spent on it. Mr. FAWCETT thinks that, by a sacrifice of about 170,000*l*., it would be possible to substitute for the present shilling rate a rate of a halfpenny per word, including addresses, with a minimum charge of sixpence. The service would still yield a profit of something over 3*l*. per cent.; and the immense increase in the number of telegrams that would almost certainly follow would very soon bring the profits up to their present level. Mr. FAWCETT does not mention one very considerable difficulty to which a great cheapening of telegrams might give rise. Telegrams, unlike letters, must be delivered immediately upon their arrival. If they are kept back till a stated hour, half the use of sending them disappears. In London, for example, where there are hourly deliveries of letters, there would be no advantage in sending telegrams if they were only sent out at fixed intervals. It is possible that in London the reduction of the charge to sixpence might increase the number beyond any calculable proportion to the present number; and in that case, both as regards cost and convenience, the question of delivery would become really serious. The community would be in a fair way to being divided into those to whom telegrams were addressed and those by whom they were being delivered. The negotiations for a parcel post were begun under Lord JOHN MANNERS, the parties to them being the Post Office on the one side and the Railway Companies on the other. Each possesses advantages which the other cannot hope to rival, and consequently a parcel post will obviously be best set on foot by a cordial co-operation between the two. Under any system the Railway Companies must carry the parcels from place to place, and that part of the labour will be left to them under the new arrangements. But, if the Railway Companies were to organize a staff of their own for the delivery of parcels at the houses of those to whom they are addressed, they could only do so at a great expense to themselves and by altogether ignoring the existing staff of the Post Office. It is now proposed that the Railway Companies shall undertake the carriage of parcels, and the Post Office their delivery, and, to a certain extent, their collection. The cost of carriage is to be prepaid by a stamp, and a fixed proportion of the receipts is to be paid over to the Railway Companies. In this way the Companies will be the gainers by the money they receive from the Post Office and the money they save upon the maintenance of a staff of servants for delivering parcels. The Post Office will gain by the immense development which the service is likely to undergo. The public will gain by the additional facilities for sending parcels, with a perfect knowledge of how much there is to pay, and full assurance that nothing will remain to be paid at the other end.

HELLENIC STUDIES IN ENGLAND.

IN spite of the invaluable services which Englishmen like Colonel Leake and Mr. Newton have lent to archæology, it must be admitted that the study of classical life, as illustrated by the material relics of old times, has long been neglected in England. The Universities for two or three generations have been ruled by scholars who seemed almost to despise archæology. Statues they were uninterested in, gems seemed to them mere curious toys of the dilettante, the evidence of coins they never cared to study, even manuscripts were thrown on one side. Classical scholarship was made to consist in an accurate acquaintance with the printed texts of a very few poets, dramatists, orators, and historians. It was usual to pooh-pooh all attempts to illustrate Greek history and Greek art by the Comparative method. Everything but steady attention to certain grammars, to the making of Greek verse, and to the "books" taken up in the Schools, was discouraged and discountenanced. Ten years ago a man might take first classes in the classical schools at Oxford, and never be reminded by tutors or professors that Greece had left any remains, anything to speak of her habits in common life and her achievements in art, except the narrow list of books required by examiners. It appeared to be the orthodox idea that these books had been brought down by a priest of the Muses from the summit of Helicon, and that all the rest of ancient Greece—statues, buildings, inscriptions, coins, utensils, weapons—had been swept away by a deluge. Thus men acquired a singularly narrow and purblind scholarship. What was worse, they were apt to be infected with the orthodox contempt for the study of the material relics of Greece. England had a curious period of unintelligent and narrow-minded scepticism, when students seemed to disbelieve in any results obtained by archæological methods. They would not listen to accounts of success in translating the inscriptions of Egypt and Assyria. They appeared to
